The self-quenching streamer (SQS) mode is understood these days as one of the basic modes of gas counter operation. In the present work, the SQS transition is clearly observed for Ar-, Kr- and Xe-mixtures with CH_4, C_2H_6, C_3H_8, $isoC_4H_{10}$ and CO_2, and for He- and Ne-mixtures with C_2H_6, C_3H_8 and $isoC_4H_{10}$. For He- and Ne-mixtures with CH_4 or CO_2, the GM discharge is developed instead of the SQS transition. The avalanche size at the transition voltage decreases, in the order of He-, Ne-, Ar-, Kr- and Xe-mixtures, except for He-mixtures with CH_4 or CO_2. The mechanisms of the SQS transition proposed by Atac et al. and Zhang have disadvantages in explaining all these results. If the photo-ionization is assumed as in Atac's mechanism, energetic photons whose yield is sufficiently large are needed for the SQS transition. The interaction between metastable states of rare gases proposed by Zhang may be energetically capable of producing electrons for the transition; effects of quenching gas in mixtures cannot be explained by this mechanism. Further investigation is necessary for microscopic processes occurring in the avalanche development. More detailed information is required on the atomic reaction cross sections of photo-ionization, radiative recombination, etc. (N.K.).

28904 (KEK–89-5, pp. 110-117) **A rod-like plastic scintillation detector for use in gamma-ray dosimetry and attempts to attain uniform response.** Yamashita, Mikio (Electrotechnical Lab., Tsukuba, Ibaraki (Japan)); Kawada, Yasushi; Avundukluoglu, M.A. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Jul 1989. (CONF-8901178–: 4. workshop on radiation detectors and their uses, Tsukuba (Japan), 24-25 Jan 1989). In *Radiation detectors and their uses.* Order Number DE90741444. Available from NTIS (US Sales Only), PC A08/MF A01.

The paper describes experiments made in an effort to develop scintillation dosimeters with emphasis on some attempts to attain a uniform response over the whole length of scintillators. A new method is proposed for measuring absorbed dose rate in plastic scintillators, using the photon-counting technique for measuring the total amount of luminescence from the scintillator exposed to gamma-rays. If a rod plastic scintillator and lucite light guides with well-polished and non-coated surfaces are surrounded by non-reflective material with a definite air gap between them, the scintillation light is transmitted to the PMTs only by the inner total reflection from the surface; a good uniformity of response could be expected if it were not for light attenuation in the transmission through the medium. With a diffusion reflector in non-optical contact with the scintillator surface, the scintillation light which otherwise would escape from the surface is partly reflected back into the scintillator. This effect is examined quantitatively. Measurements show that the presence of the diffusion reflector permits the uniformity of response to be improved considerably; a uniformity within 20 % is obtained. (N.K.).

28905 (KEK–89-5, pp. 118-125) **A simplified cosmic ray counter.** Akiyama, Nobue (Japan Radiation Engineering Co. Ltd., Hitachi, Ibaraki (Japan)); Aoyama, Takahiko; Minato, Susumu. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Jul 1989. (CONF-8901178–: 4. workshop on radiation detectors and their uses, Tsukuba (Japan), 24-25 Jan 1989). In *Radiation detectors and their uses.* Order Number DE90741444. Available from NTIS (US Sales Only), PC A08/MF A01.

The report addresses a study on the feasibility of cosmic ray non-destructive investigation by using a very simplified counter which consists of CsI(Tl) scintillator and photodiode. The intensity of cosmic rays transmitted through material is represented as a function of the shape and density of the material. It is assumed that the cosmic rays penetrate material rectilinearly and that the building has a homogeneous and uniform body. This leads to an equation for the intensity of cosmic rays. With the equation, the bulk density of the material can be estimated from a measured muon intensity if the vertical component of the initial muon intensity is known. The coincidence method is effective to distinguish cosmic rays from terrestrial gamma rays. In a single sensor, cosmic rays from every possible angle can be counted so that the distinctness of the figure may be degraded. Here, an examination is made of a 10 mm cubic CsI(Tl) scintillator and photo-diode as a sensor. Cosmic-rays are measured in a room located on the 1st floor in a 4-storied concrete building. The measured counting rate in the room is in good agreement with a value obtained from a generally used empirical formula. (N.K.).

28906 (KEK–89-5, pp. 126-133) **A neutron detector using silicon pin photodiodes.** Aoyama, Takahiko (Nagoya Univ. (Japan). Faculty of Engineering); Oka, Yasushi; Watanabe; Tamaki. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Jul 1989. (CONF-8901178–: 4. workshop on radiation detectors and their uses, Tsukuba (Japan), 24-25 Jan 1989). In *Radiation detectors and their uses.* Order Number DE90741444. Available from NTIS (US Sales Only), PC A08/MF A01.

Silicon pin photodiodes in recent years have been used as detectors for charged particle and low energy X- and gamma-ray spectroscopy instead of conventional surface barrier detectors. This is because pin photodiodes have a higher energy resolution, and the cost required for these purposes is lower. The present paper describes the development of a highly sensitive and small sized neutron detector for personal monitoring using pin photodiodes with a gadolinium-foil neutron converter. A detection efficiency of 3.1 % is obtained for thermal neutrons by detecting internal conversion electrons emitted from a gadolinium-foil converter. Gamma-component contained in the output pulses is cancelled nearly completely by using twin photodiode with tin foil instead of the gadolinium converter. A low detection limit of 240 $cm^{-2}sec^{-1}$ for thermal neutron flux density is obtained under gamma-background with a dose rate of 25 μSv/hr. Since the present neutron detector is also sensitive to gamma-rays, it is suitable to measure the equivalent dose rate in a mixed field of neutrons and gamma-rays. The detector could be useful for the construction of real-time neutron dosimeters. (N.K.).

28907 (KEK–89-5, pp. 134-147) **Neutron field measurements at high energy proton accelerators.** Suzuki, T. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Noguchi, M.; Oki, Y. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Jul 1989. (CONF-8901178–: 4. workshop on radiation detectors and their uses, Tsukuba (Japan), 24-25 Jan 1989). In *Radiation detectors and their uses.* Order Number DE90741444. Available from NTIS (US Sales Only), PC A08/MF A01.

Since the revised Japanese Radiation Protection Law requires that the dose equivalent of neutron be evaluated with double the quality factor, it becomes necessary to review the neutron dose equivalent with the new quality factor. At high energy proton accelerators, stray neutrons are produced mostly at target stations for secondary beam lines and beam dumps. Stray neutrons are also produced by a beam loss along the beam lines. The stray neutrons after penetrating through shields have widely varying energies from thermal to nearly the accelerated proton energies. Here, the Bonner sphere spectrometer and activation detectors are used to obtain neutron energy spectra outside the shield of the EP2 proton beamline in the counter wall at the National Laboratory of High Energy Physics. Results agree well with the calculation by O'Brien and a dose equivalent deduced from the spectrum is also comparable with the regular field monitoring at the Laboratory using a dose equivalent rem counter. In the measurements made, higher energy neutrons than 20MeV are observed and contribute 50 % to the dose equivalent. As a result, it seems reasonable that, in the regular field monitoring with a rem counter, readings of the counter are doubled in evaluating the radiation level in μSv/h. (N.K.).

28908 (KFK–4652) **The Karlsruhe 4π barium fluoride detector.** Wisshak, K.; Guber, K.; Kaeppeler, F.; Krisch, J.; Mueller, H.; Rupp, G.; Voss, F. Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Inst. fuer Kernphysik; Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Hauptabteilung Ingenieurtechnik. Dec 1989. 122p. Order Number DE90780246. Available from NTIS (US Sales Only), PC A06/MF A01.

A new experimental approach has been implemented for accurate measurements of neutron capture cross sections in the energy

range from 5 to 200 keV. The Karlsruhe 4π Barium Fluoride Detector consists of 42 crystals shaped as hexagonal and pentagonal truncated pyramids forming a spherical shell with 10 cm inner radius and 15 cm thickness. All crystals are supplied with reflector and photomultiplier, thus representing independent gamma-ray detectors. Each detector module covers the same solid angle with respect to a gamma-ray source located in the centre. The energy resolution of the 4π detector is 14% at 662 keV and 7% at 2.5 MeV gamma-ray energy, the overall time reslution is 500 ps and the peak efficiency 90% at 1 MeV. The detector allows to register capture cascades with 95% probability above a threshold energy of 2.5 MeV in the sum energy spectrum. Neutrons are produced via the $^{7}Li(p,n)^{7}Be$ reaction using the pulsed proton beam of a Van de Graaff accelerator. The neutron spectrum can be taylored according to the experimental requirements in an energy range from 5 to 200 keV by choosing appropriate proton energies. A collimated neutron beam is passing through the detector and hits the sample in the centre. The energy of captured neutrons is determined via time of flight, the primary flight path being 77 cm. The combination of short primary flight path, a 10 cm inner radius of the spherical BaF_2 shell, and the low capture cross section of barium allows to discriminate background due to capture of sample scattered neutrons in the scintillator by time of flight, leaving part of the neutron energy range completely undisturbed. (orig./HSI).

28909 (LPNHE–89-04) **The multistep chamber as a hardware event buffer.** Astier, P. (Paris-11 Univ., 91 - Orsay (FR). Lab. de Physique Nucleaire et Hautes Energies); Charpak, G.; Dominik, W.; Sauli, F. Paris-11 Univ., 91 - Orsay (France). Lab. de Physique Nucleaire et Hautes Energies. Jun 1989. 15p. (CONF-8905194–: 4. Pisa meeting on advanced detectors: frontier detectors from frontier physics, La Biodola (Italy), 21-26 May 1989). Order Number DE90770336. Available from NTIS (US Sales Only), PC A03/MF A01.

We study a multistep chamber optically read out used as a buffered tracking detector for a tagged neutrino beam.

28910 (NIKHEF-H–89-12) **Three-dimensional computation of magnetic fields and Lorentz forces of an LHC dipole magnet.** Daum, C. (Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H); Avest, D. ter. NIKHEF-H-Technical University Twente Collaboration. Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H. Jul 1989. 54p. (LHC-Note–94). Order Number DE90625158. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

Magnetic fields and Lorentz forces of an LHC dipole magnet are calculated using the method of image currents to represent the effect of the iron shield. The calculation is performed for coils of finite length using a parametrization for coil heads of constant perimeter. A comparison with calculations based on POISSON and TOSCA is made. (author). 5 refs.; 31 figs.; 6 tabs.

28911 (NUREG/CR–5540) **Performance testing of extremity dosimeters, Study 2.** Harty, R. (Pacific Northwest Lab., Richland, WA (USA)); Reece, W.D.; Hooker, C.D. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Regulatory Applications; Pacific Northwest Lab., Richland, WA (USA). Apr 1990. 85p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC06-76RL01830. (PNL–7276). Available from NTIS, PC A05/MF A01 - GPO; OSTI; INIS.

The Health Physics Society Standards Committee (HPSSC) Working Group on Performance Testing of Extremity Dosimeters has issued a draft of a proposed standard for extremity dosimeters. The draft standard proposes methods to be used for testing dosimetry systems that determine occupational radiation dose to the extremities and the performance criterion used to determine compliance with the standard. Pacific Northwest Laboratory (PNL) has conducted two separate evaluations of the performance of extremity dosimeter processors to determine the appropriateness of the draft standard, as well as to obtain information regarding the performance of extremity dosimeters. Based on the information obtained during the facility visits and the results obtained from the performance testing, it was recommended that changes be made to ensure that the draft standard is appropriate for extremity dosimeters. The changes include: subdividing the mixture category and the beta particle category; eliminating the neutron category until appropriate flux-to-dose equivalent conversion factors are derived; and changing the tolerance level for the performance criterion to provide consistency with the performance criterion for whole body dosimeters, and to avoid making the draft standard overly difficult for processors of extremity dosimeters to pass. 20 refs., 10 figs., 6 tabs.

28912 (ORNL/FTR–3576) **[L* detector as one of the systems proposed for use on the Superconducting Super Collider]: Foreign trip report, February 21–March 01, 1990.** Appleton, B.R. Oak Ridge National Lab., TN (USA). 6 Apr 1990. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90009852. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The purpose of this trip was to initiate the process of preparing an Expression of Interest (EOI) letter or proposal to the Department of Energy for the L* detector as one of the systems proposed for use on the Superconducting Super Collider (SSC) for high energy physics measurements. The L* collaboration involves scientists from many countries and the Moscow meeting was the first of several that will define the roles and responsibilities appropriate for the various participants. The final meeting will be hosted by Oak Ridge National Laboratory (ORNL) on April 26–28, 1990. We also attended a meeting at CERN prior to the Moscow meeting to discuss the magnet system proposed for L* and to hear of the latest physics measurements from the L3 detector located on the LEP accelerator at CERN.

28913 (ORNL/FTR–3585) **[Assembly of phototubes to lead-glass detectors]: Foreign trip report, March 5–April 3, 1990.** Cumby, R.P. Oak Ridge National Lab., TN (USA). 12 Apr 1990. 2p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90009850. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler participated in the assembly of phototubes to lead-glass detectors in preparation for stacking into two main frames, 1250 tubes each.

28914 (RAL–89-119) **GUFDIPP - the GUERAP user-friendly data-input programme package for generating and modifying GUERAP III data-files.** Richards, A.G. Rutherford Appleton Lab., Chilton (UK). Nov 1989. 344p. Order Number DE90625165. Available from NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

This document describes the GUERAP User-Friendly Data-Input Program Package, called GUFDIPP for short. GUFDIPP is a large suite of programs, developed at RAL (Rutherfield Appleton Laboratory), with the specific purpose of providing a user-friendly interface to the GUERAP III straylight analysis program. GUERAP III is a powerful, Monte-Carlo based program (supplied under licence from ESTEC) for simulating the transfer of electromagnetic radiation between the surfaces of a physical structure and it requires a rather detailed data-set to describe the structure to be modelled. GUFDIPP was developed in order to permit the GUERAP III dataset to be easily, efficiently and accurately built-up and modified, so that access to the GUERAP III program would be much easier, therefore encouraging its use. This document acts as a user-manual for GUFDIPP. Perhaps the most powerful of GUFDIPP's capabilities are those which permit the extraction of subsets of surfaces from a model's datasets to create a new 'sub-model' and the ability to 'add' two models' datasets to create a new 'merged' model. These permit considerable time-saving when entering constraint surface information for a sensor model. (author).

28915 **A neutron streak camera.** Wang, C.L. (Lawrence Livermore National Lab., CA (USA)); Lerche, R.A.; Medecki, H.; Phillips, G.E.; Singh, M.S. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors present the design and construction of a simple neutron streak camera. The cathode is a 10 μm thick U^{238}, 2.5 cm wide and 1.5 mm high, vacuum deposited on a stainless steel substrate which replaces the cathode of a Lawrence Livermore

National Laboratory (LLNL) Model 3 x-ray streak camera. Accompanying a fission fragment, about 200 low energy secondary electrons can be emitted from the cathode. The test of the streak camera at the LLNL rotating target 14 MeV neutron source is in progress. Preliminary results are presented.

28916 Progress or it all depends on your viewpoint. Fairman, W.D. (Occupational Health and Safety Div., Argonne National Lab., Argonne, IL (US)). vp. of Proceedings of the thirtieth annual conference on bioassay, analytical and environmental chemistry. NLO, Inc., Cincinnati, OH (USA) (1985). DOE Contract W-31-109-ENG-38. (CONF-841097–: Facts, paybacks and energy management programs, Baltimore, MD (USA), 15-16 Oct 1984).

Most recent progress within the Argonne Bioassay Group has been in automation and datamation. Other than minor modification in existing procedures and in troubleshooting, relatively little R and D effort has been applied to radiochemistry due to major reductions in personnel and equipment budgets. These reductions have nevertheless provided an extra incentive for automation and encouraged increased inter-group cooperation and sharing of personnel and equipment. Their records management system, which also handles sample scheduling operations, has been improved through the partial automation of laboratory faced, via tape backups, to the main personnel system. An overview of the system and its operation is presented.

28917 The effects of variations in the photocathode voltages of electronic streak cameras. Bowers, M.W. (Lawrence Livermore National Lab., CA (USA)); Biggs, G.L.; Ronchetto, J.J.; Teruya, A.T. pp. 354 of High speed photography, videography, and photonics VI. Stradling, G. L. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). DOE Contract W-7405-ENG-48. (CONF-8808220–: High speed photography, videography, and photonics VI, San Diego, CA (USA), 15-17 Aug 1988).

Electronic streak cameras are used to record subnanosecond data at the Nevada test site. It has been found that externally induced variations in the photocathode voltage of the streak tube can produce both temporal was used to model the magnification as a function of photocathode voltage and signal input position for streak tubes. Laboratory tests were also performed where pulsed and radio frequency signals were induced upon the photoccathode and the errors on the resultant image were compared with the error predicted by the electron beam code. Also, methods of processing the distortion in digitized images were investigated. This paper discusses the results of these investigations.

28918 Resolution limitations and optimization of the ITT F4157 streak tube focus for 10-ps operation. Grasz, E.L. (Lawrence Livermore National Lab., CA (USA)); Lerche, R.A.; Griffith, R.L. pp. 354 of High speed photography, videography, and photonics VI. Stradling, G.L. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). DOE Contract W-7405-ENG-48. (CONF-8808220–: High speed photography, videography, and photonics VI, San Diego, CA (USA), 15-17 Aug 1988).

The authors studied the focusing properties of an ITT F4157 image tube that was biased at voltages far from the original design and is used for operation in an ultrafast (10 ps) streak camera. Its output resolution at streak camera operating potentials was measured as a function of input slit width, incident-light wavelength, and focus-grid voltage, with results similar to those reported for the RCA C73435 streak tube. The temporal resolution is insensitive to focus-grid voltage for a narrow (50um) input slit, but is very sensitive to focus-grid voltage for a wide (500 um) input slit. Spatial resolution is nearly independent of focus-gird voltage for valves that give good temporal resolution. Both temporal and spatial resolution depend on the incident-light wavelength. Streak camera operation is simulated with a computer program that calculates photoelectron trajectories. Electron ray tracing describes the observed effects of slit width, incident-light wavelength, and focus-grid voltage on the output resolution.

28919 Veiling glare in the ITT F4113 image intensifier. Wiedwald, J.D. (Lawrence Livermore National Lab., CA (USA)); Hertel, R.J. pp. 354 of High speed photography, videography, and photonics VI. Stradling, G. L. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). DOE Contract W-7405-ENG-48. (CONF-8808220–: High speed photography, videography, and photonics VI, San Diego, CA (USA), 15-17 Aug 1988).

Users of the ITT F4113 proximity-focused image intensifier tube have generally been unable to obtain its specified resolution when using it to amplify streak tube images. As well as reduced high-frequency resolution, some output light can be detected at distances as great as a few millimeters from the input image. This long-range light spreading is called veiling glare. In this paper the authors propose the cause of the F4113's veiling glare. The most probable cause is electron scattering at the front surface of the microchannel plate, with some contribution due to electron scattering at the phosphor. Some improvements have recently been made to the F4113. These are described and possible additional improvements are suggested.

28920 (JAERI-M–89-207) **Irradiation effect of transistor by Co-60 gamma rays and electron beams: Effects of exposure rate and temperature.** Hirao, Toshio (Japan Atomic Energy Research Inst., Takasaki, Gunma (Japan). Takasaki Radiation Chemistry Research Establishment); Yoshikawa, Masahito; Morita, Yosuke; Kaiga, Hideaki; Yata, Masanobu. Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1989. 135p. (In Japanese). Order Number DE90777752. Available from NTIS (US Sales Only), PC A07/MF A01.

In order to evaluate radiation resistance of semiconductor devices which are used in radiation environments of artificial satellites and nuclear power plants, effects of radiation on the DC gain, leak current and switching time of typical transistor devices were investigated. Tested devices are PNP bi-polar transistor (2SB603), NPN bi-polar transistor (2SC764) and power MOS transistor (2SK458). Irradiation were carried out by Cobalt-60 gamma rays and electron beams of 1 and 2 MeV at exposure rates ranging from 10^2 to 10^6 R/h, and at temperature ranging from -40degC to 100degC. The following results were obtained. (1) 2SB603: Changes of the DC gain and leak current are larger in low exposure rate irradiations, and large exposure rate dependency is observed. The DC gain change is based on mainly increase of the base current. The exposure rate dependency is observed in the reverse saturation current and voltage, but in the switching time. (2) 2SC764: The exposure rate and temperature dependencies on irradiation effect are not clear, and the radiation resistance is over two orders higher than 2SB603 in the various properties. (3) 2SK458: The exposure rate and temperature dependencies on irradiation effect are small. (4) Irradiation effect on 2SB603 by electron beams is smaller than that by gamma-rays, and the exposure rate effect is observed. No difference between electron beams and gamma rays is observed for 2SC764 and 2SK458. (author).

28921 A spin dependent recombination study of radiation induced defects at and near the Si/SiO_2 interface. Jupina, M.A. (Pennsylvania State Univ., University Park, PA (US)); Lenahan, P.M. *IEEE Transactions on Nuclear Science (Institute of Electrical and Electronics Engineers) (USA)*, 36(6): 1800-1807 (Dec 1989). Contract DNA002-86-0055. (CONF-890723–: 26. annual conference on nuclear and space radiation effects, Marco Island, FL (USA), 25-29 Jul 1989).

A new electron spin resonance technique, spin dependent recombination (SDR) permits extremely rapid, high signal to noise ratio electron spin resonance (ESR) measurements of electrically active radiation damage centers in (relatively) hard MOS transistors in integrated circuits. Using SDR the authors observe the radiation induced buildup of Pbo and E' centers at relatively low concentration in individual MOSFETs in integrated circuits with (100) silicon surface orientation. Earlier ESR studies of extremely large (~1 cm^2) capacitor structures have identified Pb and E' centers as the dominant radiation induced defects in MOS devices. The authors

discuss how their results extend and confirm these earlier results and at least qualitatively answer objections to the earlier work related to the relevance of large capacitor studies to transistors in an integrated circuit.

28922 Correlation between preirradiation 1/F noise and postirradiation oxide-trapped charge in MOS transistors. Schofield, J.H. (Physics Dept., Oberlin College, OH (US)); Doerr, T.P.; Fleetwood, D.M. *IEEE Transactions on Nuclear Science (Institute of Electrical and Electronics Engineers) (USA),* 36(6): 1946-1953 (Dec 1989). (CONF-890723–: 26. annual conference on nuclear and space radiation effects, Marco Island, FL (USA), 25-29 Jul 1989).

The authors have preformed a detailed comparison of the preirradiation 1/f noise and the radiation-induced threshold voltage shifts due to oxide-trapped and interface-trapped charge, δV_{ot} and δV_{it}, for enhancement-mode, 3μ gate, n-channel Mos transistors taken from seven different wafers processed in the same lot. These wafers were prepared with gate oxides of widely varying radiation hardness. The authors show that the preirradiation 1/f noise levels of these devices correlate strongly with the postirradiation δV_{ot}, but not with the postirradiation δV_{it}. These results suggest that 1/f noise measurements may prove useful in characterizing and predicting the radiation response of MOS devices.

28923 An improved standard total dose test for CMOS space electronics. Fleetwood, D.M. (Sandia National Lab., Albuquerque, NM (US)); Winokur, P.S.; Riewe, L.C.; Pease, R.L. *IEEE Transactions on Nuclear Science (Institute of Electrical and Electronics Engineers) (USA),* 36(6): 1963-1970 (Dec 1989). DOE Contract AC04-76DP00789. (CONF-890723–: 26. annual conference on nuclear and space radiation effects, Marco Island, FL (USA), 25-29 Jul 1989).

The postirradiation response of hardened and commercial CMOS devices is investigated as a function of total dose, dose rate, and annealing time and temperature. Cobalt-60 irradiation at $\simeq$ 200 rad(SiO_2)/s followed by a 1-week 100°C biased anneal and testing is shown to be an effective screen of hardened devices for space use. However, a similar screen and single-point test performed after Co-60 irradiation and elevated temperature anneal cannot be generally defined for commercial devices. In the absence of detailed knowledge about device and circuit radiation response, a two-point standard test is proposed to ensure space surviability of CMOS circuits: a Co-60 irradiation and test to screen against oxide-trapped charge related failures, and an additional rebound test to screen against interface-trap related failures. Testing implications for bipolar technologies are also discussed.

28924 Radiation response of floating gate EEPROM memory cells. Snyder, E.S. (Sandia National Lab., Albuquerque, NM (US)); McWhater, P.J.; Dellin, T.A.; Sweetman, J.D. *IEEE Transactions on Nuclear Science (Institute of Electrical and Electronics Engineers) (USA),* 36(6): 2131-2139 (Dec 1989). DOE Contract AC04-76DP00789. (CONF-890723–: 26. annual conference on nuclear and space radiation effects, Marco Island, FL (USA), 25-29 Jul 1989).

The effect of radiation on a floating gate EEPROM nonvolatile memory cell is determined experimentally and modeled analytically. The new model predicts the threshold voltage change resulting from radiation. A screen based on the initial 1 state (excess electron) threshold voltage is shown to be necessary to assure data retention during irradiation. Techniques to increase radiation hardness are also described. The hardness of floating gate cells is shown to be limited to less than 100 krad(Si) for a fixed reference sense amplifier. The use of a differential sense amplifier may increase this limit. Therefore, floating gate memories should be useful for those applications requiring low total-doses.

28925 CMOS VLSI single event transient characterization. Heileman, S.J. (Univ. of Florida, FL (US)); Eisenstadt, W.R.; Fox, R.M.; Wagner, R.S.; Bordes, N.; Bradley, J.M. *IEEE Transactions on Nuclear Science (Institute of Electrical and Electronics Engineers) (USA),* 36(6): 2287-2291 (Dec 1989). Grant ECS-8451221. (CONF-890723–: 26. annual conference on nuclear and space radiation effects, Marco Island, FL (USA), 25-29 Jul 1989).

This paper reports single-event upset (SEU) transient measurements made on test structures developed using the MOSIS IC fabrication service. Three test structures were designed for a CMOS p-well 3μ process, including two MOS diodes for SEU transient measurements. Devices were irradiated with 5 MeV boron ions 5 MeV α particles.

28926 Circumvention of radiation-induced noise in CCD and CID imagers. Yates, G.J. (Los Alamos National Lab, Los Alamos, NM (US)); Turko, B.T. *IEEE Transactions on Nuclear Science (Institute of Electrical and Electronics Engineers) (USA),* 36(6): 2214-2222 (Dec 1989). (CONF-890723–: 26. annual conference on nuclear and space radiation effects, Marco Island, FL (USA), 25-29 Jul 1989).

Measurements of radiation sensitivity for interline transfer charge-injection devices (CIDs) from irradiation with high-energy photons (^{60}Co gammas and 3- to 5-MeV end-point Bremsstrahlung) and 14 MeV neutrons are presented to establish imager susceptibility in such environments. Results from electronic clearing techniques designed for quick ($\approx$300μs for the CCDs and $\approx$10μs for CIDs) removal (or dumping) of radiation-induced charge from prompt sources are discussed. Application of the techniques coupled with long (microsecond to millisecond) persistence radiation-to-light converters for image retention are described. Typical data illustrating the effectiveness of charge clearing in removal of radiation noise are included for nanosecond duration pulsed x-ray/γ-ray doses (50 millirad to 5-rad range) and microsecond duration neutron fluences approaching 10^8 n/cm^2.

28927 Characteristics of GaAs heterojunction FETs (HFETs) and source follower FET logic (SFFL) inverters exoposed to high energy neutrons. Janousek, B.K. (The Aerospace Corp., Los Angeles, CA (US)); Krantz, R.J.; Bloss, W.L.; Yamada, W.E.; Brown, S.; Remke, R.L.; Witmer, S. *IEEE Transactions on Nuclear Science (Institute of Electrical and Electronics Engineers) (USA),* 36(6): 2223-2228 (Dec 1989). (CONF-890723–: 26. annual conference on nuclear and space radiation effects, Marco Island, FL (USA), 25-29 Jul 1989).

This paper reports GaAs heterojunction field effect transistors (HFETs), and inverters and ring oscillators comprising HFETs exposed to neutron fluences of 5 x 10^{13}n/cm^2 to 1 x 10^{15}n/cm^2 to evaluate the characteristics of HFET integrated circuits in a high-energy neutron environment. The HFETs irradiated in this study exhibited pre-irradiation transconductances of approximately 120 mS/mm and threshold voltages of – 0.82 V. The degree of transconductance degradation is similar to that observed in ion-implanted GaAs MESFETs; however, the magnitude of the HFET threshold shift (only 140 mV at a neutron fluence of 1 x 10^{15}n/cm^2) is significantly smaller than that observed in GaAs MESFETs. The neutron-induced threshold shift in GaAs HFETs has been modeled including the effect of pinning the Fermi level at the semi-insulating boundary. Neutron bombardment of source-follower FET logic (SFFL) inverters and ring oscillators comprising HFET devices results in a reduction in high noise margin and an increase in low noise margin with a 35% reduction in ring oscillator frequency at 1 x 10^{15}n/cm^2. These results indicate that more complex HFET SFFL circuits should remain functional at high neutron fluences.

28928 (CONF-9004173–2) **Advances in surface-enhanced Raman spectroscopy for applications in real-time subsurface monitoring.** Wachter, E.A.; Ferrell, T.L.; Gammage, R.B.; Vo-Dinh, T.; Haas, J.W. III; James, D.R. Oak Ridge National Lab., TN (USA). [1990]. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From DOE real-time subsurface monitoring of groundwater workshop; Dallas, TX (USA); 17-18 Apr

1990. Order Number DE90009420. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Because of its excellent selectivity and high sensitivity, surface enhanced Raman scattering (SERS)has attracted considerable attention as a potentially powerful analytical tool for detection and screening of trace-level contaminants in groundwater. The narrow Raman bands hold promise for simplifying the identification of individual components in complex mixtures. 10 figs., 5 tabs.

28929 (EGG-M–89047) **Applications of diffraction moire interferometry to the creation of unique identifying marks.** Deason, V.A.; Ward, M.B. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1989]. 6p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-8908222–4: 3. international conference on laser interferometry, San Diego, CA (USA), 6-11 Aug 1989). Order Number DE90009764. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

With the development of the portable diffraction moire interferometer, it became possible to imagine the use of subtly distorted or aberrated diffraction gratings as unique markers. The portable system, described in another report, provides a simple and convenient method for accurately measuring the degree of distortion of an aberrated diffraction grating so as to uniquely determine the identity of the grating. The concept, technique, devices, and data reduction are described for this unusual application of diffraction gratings, interferometry, and optical fibers. 2 refs., 7 figs.

28930 (EGG-M–89050) **A compact portable diffraction moire interferometer.** Deason, V.A.; Ward, M.B. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1989]. 6p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-8908222–1: 3. international conference on laser interferometry, San Diego, CA (USA), 6-11 Aug 1989). Order Number DE90009780. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This device utilizes single mode polarization maintaining optical fibers to generate the pair of laser beams required by diffraction moire interferometry. Design of the device permits extremely rapid and convenient setup for measurement of in-plane displacement distributions on the surfaces of specimens. The device, applications, and typical data are described. 4 figs.

28931 (EGG-M–90092) **Development of a process control sensor for the glass industry: A status report.** Kramlich, J.C. (Energy and Environmental Research Corp., Irvine, CA (USA)); Gardner, M.; Koppang, R.R. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1990]. 7p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570;FC07-89ID12781. (CONF-9003138–1: Sensors Expo west conference, Long Beach, CA (USA), 14 Mar 1990). Order Number DE90009769. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

An overview is presented of a program leading to the development of a thermal sensor for the glass industry. The approach makes use of fiber optics for remote sensing and an optical multiplexer to allow economical multipoint, multiple wavelength measurements. A series of three optical approaches are under consideration for various parts of the glass forming process. These generally attempt to make use of the remote, multipoint characteristics of the prototype detector to (1) minimize the interference of reflected background radiation on optical pyrometry measurements, and (2) to use the variations of glass transmission with wavelength to develop a temperature vs. depth characteristic within the melt. 2 refs., 6 figs.

28932 A comparison of flat-field measurement techniques for optical streak cameras. Montgomery, D.S. (Lawrence Livermore National Lab., CA (USA)); Wiedwald, J.D. pp. 354 of High speed photography, videography, and photonics VI. Stradling, G. L. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). DOE Contract W-7405-ENG-48. (CONF-8808220–: High speed photography, videography, and photonics VI, San Diego, CA (USA), 15-17 Aug 1988).

A technique for calibrating the flat-field response and geometric distortion of optical streak cameras using high-power lasers and electro-optic pulse shaping hardware was reported previously. The laser hardware provides a temporarily-flat light pulse that can be used to calibrate streak cameras operating with sweep durations of 3-10 ns. Although this technique is successful, the hardware involved is expensive and the process is complex. Based on the analysis of calibrations made at these fast sweep rates, the authors developed a new technique to measure the flat-field response of an optical streak camera using an array of visible light emitting diodes (LED) and a slow sweep generator. They discuss the new slow technique and present a comparison between calibration measurements made using the two techniques.

28933 Analysis of the Boeing FEL mirror measurements. Knapp, C.E. (Los Alamos National Lab., NM (USA)); Viswanathan, V.K.; Appert, Q.D. pp. 302 of Mirrors and windows for high power/high energy laser systems. Klein, C.A. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1989). (CONF-8901159–: Mirrors and windows for high power/high energy laser systems, Los Angeles, CA (USA), 17-18 Jan 1989).

The aberrations have been measured for the finished mirrors that are part of the burst mode ring resonator of the free electron laser (FEL) being constructed at the Boeing Aerospace Company. This paper present analysis of these measurements using the GLAD code, a diffraction ray-tracing code. The diffraction losses within the resonator due to the aberration are presented. The analysis was conducted in two approaches is shown. A proposed solution to the problems caused by the aberrations is presented and analyzed.

28934 A performance evaluation of three high-fidelity streak cameras. Bonlie, J.D. (Lawrence Livermore National Lab., CA (USA)); Lowry, M.E. pp. 354 of High speed photography, videography, and photonics VI. Stradling, G.L. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). DOE Contract W-7405-ENG-48. (CONF-8808220–: High speed photography, videography, and photonics VI, San Diego, CA (USA), 15-17 Aug 1988).

Several scientific programs at Lawrence Livermore National Laboratory (LLNL) require instrumentation that can capture optical signals with high fidelity. Typically, they require high temporal resulution, high spatial resolution, and high dynamic range.The instrument of choice for most of these multichannel, data-recording applications is the optical streak camera. The authors have evaluated three optical streak camera systems under similar conditions: the EG and G model L-CA-15 streak camera, designed and built under U.S. Department of Energy (DOE) contract, with a streak tube that operates in the extraction mode; and a Thomson-CSF model TSN 506 streak camera, with an ITT F4157 streak tube that also operates in the extraction mode. All three systems were found to be capable of time response better than 40 ps FWHM, a dynamic range of greater than 100, and spatial resolution greater than 5 line pairs per millimeter (lp/mm). The experimental setup and plots of results are presented and discussed.

28935 Acoustic damage to large-aperture optics. Smith, J.R. (Lawrence Livermore National Lab., CA (USA)); Murray, J.R.; Kyrazis, D.T.; Wilcox, R.B.; Weiland, T.L.; Ehrlich, R.B.; Thompson, C.E.; Engle, R.B.; Brown, A.E. pp. 302 of Mirrors and windows for high power/high energy laser systems. Klein, C.A. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1989). (CONF-8901159–: Mirrors and windows for high power/high energy laser systems, Los Angeles, CA (USA), 17-18 Jan 1989).

The authors have observed damage to 80-cm-diam fused-silica disks and lenses subjected to high-fluence pulses (up to 2.3 j/cm^2) from an upgraded Nova laser beamline (wavelength 351 nm; pulse duration 2.35 ns; beam diameter 70 cm; energy up to 8 kj). Damage occurred in the center of each element, where a 6-cm-wide obscuration prevented direct illumination. They believe that light strongly scattered by transverse stimulated Brillouin scattering (SBS) interacts with the surface and with the bulk of the substrate, producing two kinds of acoustic waves that propagate to its center, where they become strong enough to do damage. In the surface interaction, scattered light is absorbed by an 0-ring near the perimeter of the optic, creating a Rayleigh wave that propagates along the surface to the center of the optic. The resulting damage takes the form of crater-shaped fractures about 8 mm in diameter and 4 mm deep. They propose design rules for avoiding acoustic damage in large optics and compare observed thresholds for transverse SBS with predictions in the literature.

28936 Measurements of optical loss in transparent solids using a novel spectrometer based on optical cavity decay. Milanovich, F.P. (Lawrence Livermore National Lab., CA (USA)); Hunt, J.T.; Roe, J.N. pp. 302 of Mirrors and windows for high power/high energy laser systems. Klein, C.A. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1989). (CONF-8901159–: Mirrors and windows for high power/high energy laser systems, Los Angeles, CA (USA), 17-18 Jan 1989).

Recent advances in high average power (HAP) solid state lasers and the development of new concept lasers with the potential of ultra-high average power output have put increasing demands on the transparency of optical window materials. To gain a better understanding of the current status of window materials and to direct research towards more nearly transparent materials, the authors have constructed an optical characterization facility with the purpose of making quantitative optical loss measurements in the sensitivity range of 10-3 to 10-6 cm-1. The cornerstone of this facility is a scanning optical lossmeter in which loss is determined by comparing the decay time of an optical cavity with and without a transparent solid present. The lossmeter has been applied to measurements of the optical loss of witness samples of highly transparent fused silica. A description of the lossmeter and a compilation of preliminary loss measurements are presented.

28937 A novel alignment technique for pointing and centering optical components. Ellis, R.J. (Lawrence Livermore National Lab., CA (USA)). pp. 277 of Current developments in optical engineering III. Fischer, R.E.; Smith, W.J. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). DOE Contract W-7405-ENG-48. (CONF-8808213–: Current developments in optical engineering III, San Diego, CA (USA), 15-18 Aug 1988).

A relatively simple technique was devised to precisely align the components of a diagnostic instrument which recorded the first neutron images of imploding laser fusion targets. Alignment was achieved using a laser, a 2 mm diameter glass sphere, and a pair of lenses. With this technique, a 6 cm long aperture was pointed with an accuracy of 68 microradians and coaxially aligned with a target and detector separated by 10.5 meters. The alignment technique is described and critical features are discussed.

28938 Quantitative multispectral imaging system. Bionta, R. M. (Lawrence Livermore National Lab., CA (USA)); Park, H. S.; Cook, K. J. pp. 354 of High speed photography, videography, and photonics VI. Stradling, G. L. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). DOE Contract W-7405-ENG-48. (CONF-8808220–: High speed photography, videography, and photonics VI, San Diego, CA (USA), 15-17 Aug 1988).

Describe an imaging system developed to obtain quantitative multispectral visible images of objects from an airborne platform. The system consists of a multispectral image intensified camera coupled to a real-time image processing system. The image processing system monitors the camera performance in flight. In this article, the authors processing system, the multispectral camera, the calibration procedure and present stellar intensity and spectral measurements.

28939 Comparison of mechanical and electronic high-speed recording systems. Sweatt, W.C. (Sandia Labs., Albuquerque, NM (USA)); Phipps, G.S.; Shagam, R.N.; Hill, R.A. pp. 354 of High speed photography, videography, and photonics VI. Stradling, G.L. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). (CONF-8808220–: High speed photography, videography, and photonics VI, San Diego, CA (USA), 15-17 Aug 1988).

Commercially available mechanical, video, and electronic high-speed imaging systems are compared as part of an attempt to answer the question, will electronic cameras replace film cameras for high-speed recording? Of interest is the relationship between spatial resolution and frame rate. Equally important is the compatibility of the imaging systems for recording different types of experiments and tests. The resolution of a number of systems that represent various classes of framing cameras are compared at their maximum framing rate. Included are several classes of mechanically advanced framing cameras, electronic streak cameras operated in a framing mode, and high-speed video systems. Likewise, the resolution of various classes of streak and image motion cameras are compared at their maximum temporal resolution.

28940 Equivalence of focusing conditions for holographic and varied line-space grating systems. Palmer, C. (Milton Roy Company, Analytical Products Division, 820 Linden Avenue, Rochester, New York 14625 (US)); McKinney, W.R. *Applied Optics (USA)*, 29(1): 47-51 (1 Jan 1990). DOE Contract AC03-76SF00098.

The focal conditions for diffraction grating systems that employ holographic and varied line-space gratings are shown to be formally identical. An example is given in which the recording geometry of a holographic grating is derived that provides the same imaging (to lowest order) as a ruled grating whose grooves, while straight and parallel, vary in spacing across the surface of the grating.

28941 Stable single mode operation of a quasioptical gyrotron. Antonsen, T.M. Jr. (High Power Microwave Electronics Branch, Code 4740, Naval Research Laboratory, Washington, DC 20375 (US)); Levush, B.; Manheimer, W.M. *Physics of Fluids B (USA)*, 2(2): 419-426 (Feb 1990).

The regions in parameter space of stable single mode operation of a quasioptical gyrotron are determined theoretically for a number of configurations. A pencil beam is found to give rise to large operating regimes where single mode operation is stable. These regions shrink dramatically when an annular beam is considered. However, stable operation can be restored by slightly tilting the axis of the cavity.

28942 Root-mean-square emittance increase in a nonlinear lens. Rhee, M.J. (Department of Electrical Engineering and Laboratory for Plasma Research—University of Maryland, College Park, Maryland 20742 (USA)). *Physics of Fluids B (USA)*, 2(2): 452-453 (Feb 1990).

An exact derivation of the root-mean-square emittance increase when a beam of arbitrary distribution passes through a nonlinear lens system is presented. It is found that the emittance increase depends on the spherical aberration coefficient of the lens and characteristics of the beam distribution.

28943 (BNL-NUREG–44386) **Dynamic strain gages analysis of critical welds used in power plant circuit breakers.** MacDougall, E.A. (Brookhaven National Lab., Upton, NY (USA)); Wilhelm, W.G. Brookhaven National Lab., Upton, NY (USA). [1990]. 8p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC02-76CH00016. (CONF-900599–5: 36. ISA international instrumentation symposium, Denver, CO (USA), 6-10 May 1990). Order Number DE90009524. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A history of failures in power plant circuit breakers associated with critical welds in the internal pole shafts has been investigated. This paper describes the test, equipment, and instrumentation and summarized the preliminary results of testing performed on these breakers at Brookhaven National Laboratory. It includes the description of the instrumentation including the use of a full bridge strain gage sensor and instrumentation amplifier connected to an oscilloscope. The combination provided a sensitive instrument capable of revealing subtle changes in circuit breaker performance. The strain gages were attached to pole shafts and monitored dynamically. The observed changes in wave signature were recorded as a function of accumulated operating cycles. Complex changes in wave shape recorded on an oscillograph indicate patterns related to impending weld failure. The life expectancy measured in the number of circuit breaker open and closing cycles is compared with the weld and other component failures. 8 refs., 4 figs.

28944 (CGA–CE02953, pp. 372-376) **Features of electronic correctors.** Ensch, R. (Dresser Measurement, Houston, TX (USA)). Canadian Gas Association, Don Mills, ON (Canada). [1990]. (CONF-8906313–: 28. annual gas measurement school, London (Canada), 13-15 Jun 1989; CE–02953). In *Proceedings of the twenty-eighth annual gas measurement school.* Available from Canadian Gas Association, 55 Scarsdale Rd., Don Mills, ON, CAN M3B 2R3. Prices: PRICES UPON REQUEST.

This paper discusses the performance, accuracy, calibration and safety aspects of electronic intergration (EI). Electronic intergrators must maintain high levels of accuracy under severe environmental conditions and still be able to be manufactured at a reasonable cost. There are two basic types or categories of inteceptors. The first type is an instrument that is physically attached to, or is an integral part of, the gas meter. The second type is an instrument that is located at a remote location from the metering device. The main performance specifications for EI include the following: accuracy, linearity repeatibility, low hysterysis error, ambient temperature effect operating temperature range, storage temperature range, supply voltage effect, and supply voltage range. An understanding of calibration, testing, and maintenance procedures, of limitations imposed by device powering schemes and of safety features and requirements are vital in evaluating EI equipment.

28945 (CGA–CE02953, pp. 351-364) **Fundamental of SCADA [Supervisory Control and Data Acquisition] systems.** Tornquist, E. (BC Gas Inc., Vancouver, BC (Canada)). Canadian Gas Association, Don Mills, ON (Canada). [1990]. (CONF-8906313–: 28. annual gas measurement school, London (Canada), 13-15 Jun 1989; CE–02953). In *Proceedings of the twenty-eighth annual gas measurement school.* Available from Canadian Gas Association, 55 Scarsdale Rd., Don Mills, ON, CAN M3B 2R3. Prices: PRICES UPON REQUEST.

SCADA is an acronym for Supervisory Control and Data Acquisition. It refers to a system that permits users to monitor and control remote facilities from one or several control centres. A SCADA system allows an operator located at a system control centre to make accurate and informed decisions about remote facilities that may be located at opposite ends the country or within sight of the control centre. One of the major juistifications for a SCADA system in the gas distribution field is for its contribution to the efficient contract administration required to meet gas purchase contracts and the protection of public safety. This paper discusses the digital system components, the schematic layout of the system, and various aspects of multiplexing and digital signal transmission on SCADA systems. 4 refs., 9 figs.

28946 (CGA–CE02953, pp. 335-342) **Canadian Meter/Elster gas measurement products.** Poole, J. (Canadian Meter Co. Inc., Milton, ON (Canadian)); Barnett, B. Canadian Gas Association, Don Mills, ON (Canada). [1990]. (CONF-8906313–: 28. annual gas measurement school, London (Canada), 13-15 Jun 1989; CE–02953). In *Proceedings of the twenty-eighth annual gas measurement school.* Available from Canadian Gas Association, 55 Scarsdale Rd., Don Mills, ON, CAN M3B 2R3. Prices: PRICES UPON REQUEST.

Ruhr Gas is one of the largest natural gas transmission companies in the world , delivering virtually all natural gas from the Soviet Union to Europe. In addition, two meter manufacturers, Elster Meter and Kromschroder are owned by Ruhr Gas. This relationship has led to an agreement between Elster and Canadian Meter whereby Canadian Meter has marketing rights to Elster in Canada. The Elster product line consists of many different types of meters, regulators, instruments, test meter. This paper describes product lines which Canadian Meter is marketing. Product capabilities are described for the Qantometer QA series gas turbine meter, the high pressure diaphragm meter and a variety of computerized data collecting and processing systems. 3 figs., 1 tab.

28947 (CGA–CE02953, pp. 323-330) **Metretek year two at Consumers Gas.** Eagleson, D. (Consumers Gas Co., Toronto, ON (Canada)). Canadian Gas Association, Don Mills, ON (Canada). [1990]. (CONF-8906313–: 28. annual gas measurement school, London (Canada), 13-15 Jun 1989; CE–02953). In *Proceedings of the twenty-eighth annual gas measurement school.* Available from Canadian Gas Association, 55 Scarsdale Rd, Don Mills, ON, CAN M3B 2R3. Prices: PRICES UPON REQUEST.

In the fall of 1985 Consumers Gas began a pilot project to evaluate the Metretek automatic meter reading system. This pilot project was originally set up to test both the Metretek automatic meter reading system and electronic correctors that would be used in conjunction with the Metretek sytem. The field trail proved both the viability of the Metretek System and the electronic correctors that Consumers had chosen as the preferred method of volume correction. Starting in April of 1988 Consumers began billing using the Metretek system. This paper depicts some of the current and past field installation procedures for the Metretek AMR system used at Consumers. Consumer's Gas uses the Metretek Networked System to collect data from a call-in system. Data is called in twice per day. Data thus collected is stored on a file server on a PC. The stored data is translated and uploaded to the mainframe system in an overnight batch operation. Several edits are performed on the Metretek data before it is passed to the chart calcualtion system. This system has proved to be very reliable and customer response has been good. 1 fig.

28948 (CGA–CE02953, pp. 316-322) **Fundamentals of diaphragm meters.** Albert, N.E. (ICG Utilities (Ontario) Ltd., North Bay, ON (Canada)). Canadian Gas Association, Don Mills, ON (Canada). [1990]. (CONF-8906313–: 28. annual gas measurement school, London (Canada), 13-15 Jun 1989; CE–02953). In *Proceedings of the twenty-eighth annual gas measurement school.* Available from Canadian Gas Association, 55 Scarsdale Rd, Don Mills, ON, CAN M3B 2R3. Prices: PRICES UPON REQUEST.

This paper describes the fundamentals of diaphragm meters, covering their history, components and basic operation. The first gas meters were invented in 1815 by Samuel Clegg in England. It was a wet variety of meter which is a water or oiled sealed. It lost popularity because of its cost, failures related to temperature, and the difficulty in maintaining proper liquid levels within the meter. In 1844, Croll and Richard of England invented a two-diaphragm, slide-valve, dry meter. This meter was later perfected by Thomas Glover. In 1903 a three chamber diaphragm meter was invented. Diaphragm meters are still popular today. The diaphragm meter consists of four main components; the diaphragm which acts as a measuring container, the valve and seal, the tangent, and the index a simple mechanical gear ration device that measures the gas flow. The operation of four chamber diaphragm meter, temperature compensated diaphragm meters and three chamber diaphragm meters is described. 3 refs.

28949 (CGA–CE02953, pp. 468-480) **Latest technology in moisture measurement.** Kunz, N. (Stephens Equipment Inc., Oakville, ON (Canada)). Canadian Gas Association, Don Mills, ON (Canada). [1990]. (CONF-8906313–: 28. annual gas measurement school, London (Canada), 13-15 Jun 1989; CE–02953). In *Proceedings of the twenty-eighth annual gas measurement school.* Available from Canadian Gas Association, 55 Scarsdale Rd., Don Mills, ON, CAN M3B 2R3. Prices: PRICES UPON REQUEST.

The need for accurate determination of water content of natural gas is critical to producers, distributors and end users alike, in order that quality control be maintained. Moisture measurement is a difficult task under ideal conditions when using conventional instrumentation such as chilled mirror, (Bureau of Mines Dewpoint Tester), electrolytic and aluminum oxide technology. When the quality of gas changes, such as sudden slugs of moisture, glycol, particulates or other contaminants, accurate measurement becomes virtually impossible due to inherent characteristics of the aforementioned technologies. The advent of the M.C.M. silicon chip sensors and new moisture calibration genertors has not only addressed the problems associated with conventional technology but has allowed meaningful hygrometer evaluations to be conducted. Silcon chip moisture detection is compared with chilled mirror, electolytic, oscillating crystal and aluminum oxide tests. This technology eliminates frequent down-time and inaccuracy formerly associated with measurement of very moist gases. 7 refs., 3 figs.

28950 (CGA–CE02953, pp. 455-467) **ELSA a family of electronic correctors.** Barnett, B. (Canadian Meter Co, Inc., Milton, ON (Canada)). Canadian Gas Association, Don Mills, ON (Canada). [1990]. (CONF-8906313–: 28. annual gas measurement

school, London (Canada), 13-15 Jun 1989; CE–02953). In *Proceedings of the twenty-eighth annual gas measurement school.* Available from Canadian Gas Association, 55 Scarsdale Rd., Don Mills, ON, CAN M3B 2R3. Prices: PRICES UPON REQUEST.

The ELSA electronic corrector is a complete system for use on all gas meters with an instrument drive output. The ELSA is battery powered and completely self contained including the volume switching and pressure transducer. The housing is cast aluminum, weather resistant, and secured with several tamper proof features. ELSA receives volume input from the meter via a rotating shaft with uncorrected values between 5 and 1000 ft./rev. or alternately it will accept pulses from a user supplied contact closure. The shaft rotation, which can be in either direction is immediately digitized by four switches operating in sequence. The digitized volume is fed directly to the micromprocessor based digital computer which is simultaneously receiving pressure and temperature imputs from the transducers. The microprocessor digitally computes the corrected volume by applying the pressure and temperatue factors, along with compressibility to the uncorrected volume and up-dates a digital display of corrected volume every 32 seconds. Included in this report is a detail description of ELSA and the remote data acquisition system designed for use with micro-or main frame computers. 3 figss., 4 tabs.

28951 (CGA–CE02953, pp. 425-447) **Development of Canadian meters automatic meter reading system.** Poole, J. (Canadian Meter Co., Milton, ON (Canada)); Barnett, B. Canadian Gas Association, Don Mills, ON (Canada). [1990]. (CONF-8906313–: 28. annual gas measurement school, London (Canada), 13-15 Jun 1989; CE–02953). In *Proceedings of the twenty-eighth annual gas measurement school.* Available from Canadian Gas Association, 55 Scarsdale Rd., Don Mills, ON, CAN M3B 2R3. Prices: PRICES UPON REQUEST.

This paper describes the components of an radio frequency (RF) automatic meter reading system as well as design objectives and benefits. By using an RF system to read meters, a utility company greatly improves its data collecting capability and its relationship with the customer. The company also increases the accuracy of reads by eliminating the human error factor and also it increases its efficiency by increasing the number of meters read per day per meter reader. The RF system provides several advantages over a telephone system. First, no telephone lines need to be run to the meters, thus decreasing installation costs and decreasing the possibility of vandalism. Secondly, an RF system eliminates any involvement with the phone company, including installation costs, tariffs, line charges and regulations. Finally, if eliminates down-time which would be incurred when the telephone system experiences service intenrruption. 1 fig.

28952 (EGG-M–90028) **A hydrogen transient nuclear magnetic resonance sensor for industrial drying applications.** Nicholls, C. Southwest Research Inst., San Antonio, TX (USA). [1990]. 9p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. (CONF-9003138–2: Sensors Expo west conference, Long Beach, CA (USA), 14 Mar 1990). Order Number DE90009616. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

It has been estimated that industrial non-paper drying processes consume ~0.8 quad (i.e. 8×10^{14} BTU) of energy per year in the United States, representing ~5% of total industrial consumption. If improved technologies could be used to increase the efficiencies of the drying process and hence produce a 2% reduction in energy consumption, the energy savings would be 0.016 quad per year, or ~2.5 million bbl of crude oil. DOE studies indicated that the most attractive R&D target to aid in achieving these savings was an advanced moisture sensor, capable of application to a wide variety of drying processes. To meet these objectives the sensor should accurately monitor product moisture content over the range 2–35 % wt moisture (wb) and be usable at temperatures up to 350°F. 22 refs., 11 figs., 1 tab.

28953 (JAERI-M–89-205) **Development of the remote-controlled electrical resistance measurement apparatus.** Hoshiya, Taiji (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Takada, Fumiki; Kizaki, Minoru; Sudo, Kenji; Sakakura, Atsushi; Ichihashi, Yoshinori; Den, Shoji. Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1989. 80p. (In Japanese). Order Number DE90777742. Available from NTIS (US Sales Only), PC A05/MF A01.

A remote-controlled electrical resistance measurement apparatus with a variable-temperature control has first been developed to understand changes in transformation characteristics of shape memory alloys after irradiation. Both isochronal and isothermal annealing experiments (post-irradiation experiments) have been carried out for irradiated Ti-Ni shape memory alloys intimately associated with shape recovery capabilities by using this apparatus. Form in-service testing results of this apparatus, it was shown that from the view point of the handling or reliability of the apparatus, a temperature control method using the simple specimen-driving system was best suited for the remote-controlled measurement on physical properties of specimens, because of no use of semiconductors or temperature sensors to be highly sensitive to gamma ray irradiation and that it was applicable to other remote-controlled apparatuses. And thus, experimental results were obtained from electrical resistance measurements that electrical resistance of irradiated shape memory alloys markedly changed during neutron irradiation and revealed the negative temperature dependence and that those alloys are very sensitive to the neutron irradiation and that they have the damage-restoration effect. Furthermore, it makes clear that the newly developed remote-controlled electrical resistance measurement is quite a simple measuring method and can be used for the study of phase transformation materials to be associated with the structure-sensitivity, which are inclined to be influenced by neutron irradiation. (J.P.N.).

28954 (KCP–613-4302) **Small strain gage applications 2.** Wenski, E.G. Allied-Signal Aerospace Co., Kansas City, MO (USA). Kansas City Div. Mar 1990. 15p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00613. (CONF-9006124–1: Society for Experimental Mechanics conference, Albuquerque, NM (USA), 4-6 Jun 1990). Order Number DE90008312. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper describes a number of small strain gage applications conducted recently at Allied-Signal Inc., Kansas City Division. These stress analyses used some of the smallest strain gages commercially available on the market today. Although data reduction techniques remain the same for these small-scale analyses, gaging techniques differ from application to application. This paper discusses three different strain gage applications using 0.015 grid area strain gages. 9 figs.

28955 (N–90-15545) **Superconducting gravity gradiometer mission. Volume 1: Study team executive summary.** Morgan, S.H.; Paik, H.J. National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center. Aug 1989. 42p. (NASA-TM–4091-VOL-1;NAS–1.15:4091-VOL-1). Available from NTIS, PC A03/MF A01.

An executive summary is presented based upon the scientific and engineering studies and developments performed or directed by a Study Team composed of various Federal and University activities involved with the development of a three-axis Superconducting Gravity Gradiometer integrated with a six-axis superconducting accelerometer. This instrument is being developed for a future orbital mission to make precise global gravity measurements. The scientific justification and requirements for such a mission are discussed. This includes geophysics, the primary mission objective, as well as secondary objectives, such as navigation and tests of fundamental laws of physics, i.e., a null test of the inverse square law of gravitation and tests of general relativity. The instrument design and status along with mission analysis, engineering assessments, and preliminary spacecraft concepts are discussed. In addition, critical spacecraft systems and required technology advancements are examined. The mission requirements and an engineering assessment of a precursor flight test of the instrument are discussed.

28956 (PNL-SA–17849) **Field monitoring equipment development and deployment.** Fishbaugher, M.J. Pacific Northwest Lab., Richland, WA (USA). Apr 1990. 5p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC06-76RL01830. (CONF-9004134–2: Field monitoring for a purpose conference, Gothenburg (Sweden), 2-5 Apr 1990). Order Number

DE90009453. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Pacific Northwest Laboratory (PNL) has developed field monitoring technology as part of its continuing research for the US Department of Energy (DOE) and the utility industry. PNL has found that successful completion of field monitoring studies depends on precise definition of data requirements and careful selection of equipment and data processing systems. Project size dictates the level of required automation. 4 refs., 1 tab.

28957 (SAND–89-0461) **Laboratory evaluation of the PCP Large Reaction Volume Ion Mobility Spectrometer (LRVIMS).** Schellenbaum, R.L.; Hannum, D.W. Sandia National Labs., Albuquerque, NM (USA). Mar 1990. 37p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE90010230. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The PCP, Inc. Large Reaction Volume ion Mobility Spectrometer (LRVIMS) was characterized and evaluated for use as a contraband explosives vapor detector in personnel and package portal screening applications. The limit-of-detection was found to be a constant ~0.3 PPT experimentally and in calibrations using a Thermedics RDX generator. The minimum LOD in terms of RDX vapor molecular flow rate was $\sim 1.8 \times 10^9$ molecules/sec at 16.6 L/min airflow through the 100 cm^2 square tube area of this ion mobility spectrometer. Samples of 0.5 gm of TNT in plastic bags in the center of the personnel screening portal were easily detected. Bomb quantity (8 oz) samples of TNT and Comp B (40% TNT, 60% RDX) were also detectable in the personnel portal configuration. No detections of RDX were possible in any position of either C-4 or Comp B or of PETN in Detasheet or Det Cord. Operation in the presence of observed background interferants, operation at very low airflow rates, and proposed operation in conjunction with preconcentrators, also are described. 14 figs.

28958 (SAND–90-0050C) **Phase Doppler droplet sizing: Scattering angle effects.** Ceman, D.L.; O'Hern, T.J.; Rader, D.J. Sandia National Labs., Albuquerque, NM (USA). [1990]. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9006155–1: ASME fluid measurements and instrumentation conference, Toronto (Canada), 4-7 Jun 1990). Order Number DE90009571. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The phase Doppler technique is an LDV-based method for the nonintrusive, simultaneous measurement of particle size, velocity, and concentration. It is becoming a standard device for measurement of spray droplets in air as well as cavitation nuclei bubbles in water. The Phase Doppler Particle Analyzer (PDPA) is a commercial phase Doppler instrument. Previous calibrations of the PDPA using well-characterized liquid droplets have revealed nonlinearity of the instrument response for droplet diameters less than 20 μm. For many applications, droplet sizing accuracy in the small diameter range is critical. Light scattering calculations performed by the instrument manufacturer suggest two theoretical approaches to improving the instrument response in this size range: optimizing the collection angle and increasing the collection area. The first approach has been tested experimentally. This paper presents size calibrations of the PDPA with the receiver configured at two angles: 30° (the standard configuration) and 70° off-forward axis. The calibration was performed with monodisperse oleic acid droplets in the diameter range 3.7 to 32 μm. As in earlier calibration studies, the 30° configuration resulted in marked nonlinearity in instrument response below 20 μm. Oscillations were still apparent for the 70° configuration, which showed only a modest improvement compared to the response at 30°. 7 refs., 5 figs.

28959 (SAND–90-0906C) **Characterization and calibration of coordinate measuring machines.** Pace, C.F. Sandia National Labs., Albuquerque, NM (USA). [1990]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9005157–1: Methods and equipment of metrology equipment, Milwaukee, WI (USA), 7-9 May 1990). Order Number DE90009320. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

With the increasing use of three axis coordinate measuring machines (CMMs) for product acceptance, part characterization and/or part inspection, there is a corresponding need for acceptable methodologies to calibrate CMMs. Potential error sources in CMMs include scale errors and geometric imperfections as well as possible errors arising from environmental factors such as excessive vibrations or thermally induced structural changes. Although numerous methods for the calibration of CMMs have been reported, this paper will review two calibration methods. The first method is the American Standard for performance testing of CMMs and the second method is a parametric calibration with error compensation of CMMs. Whereas the first method can be used to evaluate the performance of two or more CMMs or for periodically checking a CMM. The second method is more advantageous for the calibration of high accuracy CMMs operating in controlled environments. 11 refs.

28960 RMS and average errors resulting from low pass filter characteristics in instrumentation systems. Destefan, D. (Rockwell International Aerospace Operations, Golden, CO (US)). pp. 584 of Proceedings of the IEEE instrumentation and measurement technology conference. IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8904110–: IEEE instrumentation and measurement technology conference, Washington, DC (USA), 25-27 Apr 1989).

Rectangular and step-line waveforms occur in many physical systems. These waveforms are passed through sensors or signal conditioners having, in many cases, low pass filter characteristics. Further, the filtered waveforms are sampled by A/D converters and the average or rms values calibrated. This work presents the effects of the low pass filter characteristics on the average and rms values of these step-like waveforms. The analysis method used is presented. By way of example, this method is applied to a measurement problem and the results provided. The effects of assuming unit step excitation rather than physically realizable exponential step inputs are also discussed. Future work in this area is suggested.

28961 Two-dimensional coupled-mode theory for modeling leaky-mode arrays. Hadley, G.R. (Division 1164, Sandia National Laboratories, Albuquerque, New Mexico 87185 (US)). *Optics Letters (USA)*, 15(1): 27-29 (1 Jan 1990). DOE Contract AC04-76DP00789.

The use of a two-dimensional coupled-mode theory for modeling buried-ridge-waveguide index-guided arrays in general and leaky-mode arrays in particular is described. This formalism provides a framework for understanding the complicated modal structure of leaky-mode arrays by expressing their modes as linear combinations of the two-dimensional modes of the buried-ridge waveguides and the active-region confinement structure. As a result, the inherently large parameter space of these devices may be collapsed dramatically so that the device behavior is describable in terms of only the propagation constant mismatch between the buried-ridge modes and the active-region modes and their coupling coefficient.

28962 Stable mirror mount. Cutburth, R.W. To Dept. of Energy, Washington, DC. USA Patent 4892283/A/. 9 Jan 1990. Filed date 16 Jun 1988. USA Patent Application 7-207,894. Int. Cl. A47B 23/00. vp.

This patent describes a mirror mount for supporting a mirror where the mirror is oriented in an x-ray plane. The mirror mount comprising post assembly means for supporting the mirror, first keyway means for orienting the post assembly means such that the post assembly means are slidable only in a first direction parallel to a y-axis orientation, and including first screw holes, nut plate means for supporting the first keyway means and including second screw holes, second keyway means for supporting the nut plate means such that the nut plate means are slidable only in a second direction normal to the first direction and parallel to an x-axis orientation such that the post assembly means and the nut plate means are each slidable in a plane parallel to the x-y plane, and locking means normal to the x-y plane including a single screw type locking member movable in a third direction orthogonal to the first and second directions between a first position through the first and second screw holes for simultaneously locking in a single step in clamping engagement the first and second keyway means.

28963 (CONF-9006165–1) **Motion planning for the Universal Self-Deployable Cargo Handler (USDCH).** Sousk, S.F. (Army Belvoir Research Development and Engineering Center, Fort Belvoir, VA (USA)); Pin, F.G.; Crane, C.D. Oak Ridge National Lab., TN (USA). [1990]. 14p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. From U.S. army science conference; Durham, NC (USA); 12-15 Jun 1990. Order Number DE90009860. Available from NTIS, PC A03/MF A01 - OSTI.

Belvoir Research, Development and Engineering Center (Belvoir) is developing advanced material handling equipment for sustaining material requirements of Airland Battle-Future. In particular, Belvoir is developing a rough terrain forklift truck, the Universal Self-Deployable Cargo Handler (USDCH), that also is called ATLAS. USDCH program approach allows interaction between the operator and the automated controlling systems, while progressively adding robotics, artificial intelligence, and automated methods. Major challenges involve the development of methodologies to provide real-time operations in hostile field environments and to exploit human-machine synergism for maximum efficiency and reliability. This paper reports on robotic motion planning for two major functions of the USDCH: platform mobility and motion of the material handling arm. Novel approaches were necessary to automate the basic motion of the platform and the arm. The algorithms for positioning the platform at a work area are presented and results showing optimum trajectories of the vehicle are given. These results show that the methodologies and algorithms developed are applicable to a wide class of vehicles. 3 refs., 7 figs.

28964 (UCRL–21237) **Engagement analysis study: Final report.** Lawrence Livermore National Lab., CA (USA); Science Applications International Corp., Orlando, FL (USA). 29 Sep 1989. 67p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90009529. Available from NTIS, PC A04/MF A01 - OSTI.

The Missile Systems Division of Science Applications International Corporation (SAIC) originally entered into a subcontract with Lawrence Livermore National Laboratories (LLNL) in April of 1987. This subcontract was for a period of one year. Work on this effort was reported in "MaRV Engagement Analysis Study, Final Report" Dated 25 April 1988. This subcontract was later extended through 30 September 1989. The engagement analysis effort since the initial report is documented herein. This work has been in two phases, and supported LLNL in guidance and engagement analysis efforts of interest to them. The initial efforts consisted of analysis of a ground launched midcourse phase interceptor. During the later phases of the subcontract, emphasis shifted toward an innovative space based engagement concept. Both efforts are documented in this report. Part 2 of this report includes the results of simulation modifications and guidance analyses performed under DOD Subcontract to BDM Corporation, Prime Contract Number SDIO 84-88-C-0017. Additional case runs and the 6DOF results were generated under this LLNL subcontract. 37 figs., 4 tabs.

28965 (AD-A–216848/2/XAB) **Nonlinear finite-difference simulations of cavity-decoupled explosions in salt and tuff. Report for 23 March 1987-22 March 1989.** Stevens, J.L.; Murphy, J.R.; Rimer, N. S-Cubed, San Diego, CA (USA). 30 Jun 1989. 68p. (SSS-TR–89-10755). Available from NTIS, PC A04/MF A01.

Nonlinear finite difference simulations are performed to model the seismic source functions for decoupled, partially coupled, and overdecoupled explosions in air-filled cavities in salt and unsaturated tuff emplacement media. The tuff simulations are performed in an 11 meter cavity under conditions similar to the Mill Yard experiment. The salt simulations are performed in a 17 meter cavity under conditions similar to the Sterling test. The maximum low frequency decoupling factor in the tuff simulations is approximately 40. The low value of the decoupling factor is the result of the low shear modulus and poor tamped coupling of this material. The maximum decoupling factor is nearly twice as large as would be expected for a linear material model because the shock wave induces pore crushing that leads to a substantial loss of energy in the nonlinear case. An important result of this research is that the low frequency source amplitude increases very slowly as the yield is increased above the yield required for full decoupling. At high frequencies, there is little difference between simulations with linear and nonlinear material models for decoupled or partially coupled explosions, except for attenuation due to pore crushing.

28966 (UCRL–21109) **Conventional weapons demilitarization: A health and environmental effects data-base assessment: Explosives and their co-contaminants: Final report, Phase 2.** Layton, D.; Mallon, B.; Mitchell, W.; Hall, L.; Fish, R.; Perry, L.; Snyder, G.; Bogen, K.; Malloch, W.; Ham, C. Lawrence Livermore National Lab., CA (USA). Dec 1987. 402p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-48. Order Number DE90009440. Available from NTIS, PC A18/MF A01 - OSTI; GPO Dep.

To support studies of the health and environmental risks of such by-products, this report presents assessments of data available on parameters that affect the risks posed by explosives and their principal co-contaminants. Specifically, data-base assessments cover factors that influence the transport and fate of the contaminants in environmental media (e.g., soils, water, etc.) and subsequently, human exposures via different pathways (e.g., inhalation, ingestion, and skin absorption). Information on dose-response relationships for various toxic effects in humans and laboratory animals is evaluated so that acceptable daily intakes for noncarcinogenic substances and virtually safe dose rates for carcinogenic substances can be defined. Toxic effects on plant and aquatic species are also addressed. The explosives and co-contaminants considered include TNT (co-contaminants: 2,4-dinitrotoluene; 2,6-dinitrotoluene, 1,3-dinitrobenzene, 1,3,5-trinitrobenzene, 2-amino-4,6-dinitrotoluene, and 4-amino-2,6-dinitrotoluene); RDX (co-contaminant: HMX); tetryl (co-contaminant: picric acid); PETN; and ammonium picrate (co-contaminant: picric acid). 358 refs., 12 figs., 92 tabs.

28967 (UCRL–102467) **The effects of material properties and confinement on DDT.** Lee, E.L.; Weston, A.M.; Aldis, D.F. Lawrence Livermore National Lab., CA (USA). 13 Mar 1990. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9004147–4: 1990 JANNAF propulsion systems hazards meeting, Laurel, MD (USA), 3-5 Apr 1990). Order Number DE90009943. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We have used a DDT numerical code, RDUCT, to evaluate the effect of material properties and confinement on DDT in porous beds. RDUCT is a 1-D solid and gas two phase hydrodynamic program that computes deflagration to detonation transition in porous beds, using and "ignition and growth" type reaction model in a solid phase Lagrange coordinate system. The calculation model contains tamper masses at both ends of the reacting bed and is ignited by a squib at one end. Here RDUCT is used to compute the growth of reaction in porous bed inside a rigid tube. The input parameters are varied to produce changes in ignition, burn rate, and confinement. The results of this study illustrate the great sensitivity of the DDT phenomenon to these basic parameters. Implications to modelling and to practical problems of hazard are discussed. 15 refs., 19 figs., 2 tabs.

28968 (UCRL-JC–103107) **Generic initiation train for IHE [insensitive main charge explosive] fuzing.** Lee, R.S.; Weingart, R.C.; Berg, J.D. Lawrence Livermore National Lab., CA (USA). Mar 1990. 15p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-48. (CONF-9003142–1: 1990 joint government/industry symposium on insensitive munitions technology, White Oak, MD (USA), 13-14 Mar 1990). Order Number DE90009944. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The insensitive munitions now under development in the Department of Defense (DOD) complex will require fuzes which do not compromise the safety afforded by the use of insensitive main charge explosives (IHEs). At the same time the fuzes must provide

a stimulus which is robust enough to override the higher shock initiation threshold and the probably-larger critical diameter and corner-turning distance of the IHE. Design of the initiation train is critical to the safety of an IHE fuze in abnormal environments and to its proper functioning for initiating IHE. It would be particularly useful to develop design criteria for an initiation train which could be used generically in IHE munitions. The goal of our study was to demonstrate the feasibility of designing an initiation train which does not compromise the safety of an IHE main charge in abnormal thermal environments, i.e., fast and slow heating tests. 1 ref., 13 figs.

28969 (AD-A-216922/5/XAB) **Nuclear winter: A brief review and comments on some recent literature.** Deirmendjian, D. Rand Corp., Santa Monica, CA (USA). Jan 1988. 22p. (RAND/P-7233). Available from NTIS, PC A03/MF A01.

This is a follow-up to a memo on the subject of nuclear winter (NW), a term introduced by the so-called TTAPS authors in their elaboration (Turco, et al., 1983) of an original study by Crutzen and Birks (1982) on the climatic effects to be expected after a major nuclear conflict. A number of related new studies, reviews, comments, and discussions have since appeared in print. The present piece is a slightly expanded version of a brief review of–and commentary on–this literature originally incorporated in another internal RAND memo (Deirmendjian, 1985). What follows is a brief review with comments on some of the more recent NW-related literature. These notes do not by any means represent a complete and detailed analytical review of the current literature on NW work.

28970 (SAND-89-2382C) **Active primary lithium thionyl chloride battery for artillery applications.** Baldwin, A.R. (Sandia National Labs., Albuquerque, NM (USA)); Delnick, F.M.; Miller, D.L. Sandia National Labs., Albuquerque, NM (USA). [1990]. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9006146-3: 34. international power sources symposium, Cherry Hill, NJ (USA), 25-28 Jun 1990). Order Number DE90009511. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Sandia National Laboratories and Eagle Picher Industries have successfully developed an Active Lithium Thionyl Chloride (ALTC) power battery for unique artillery applications. Details of the design and the results of safety and performance will be presented. 1 ref., 5 figs.

28971 (AD-A-216641/1/XAB) **Deterministic modeling of regional wave forms from the Nevada Test Site. Final report, 5 September 1988-5 March 1989.** Burdick, L.J.; Saikia, C.K.; Helmberger, D.V. Woodward-Clyde Consultants, Pasadena, CA (USA). 19 Jul 1989. 84p. (WCCP-R-89-01). Available from NTIS, PC A05/MF A01.

Time domain waveform modeling studies of short period P_{nl} and high frequency P_n have been carried out in an attempt to improve event discrimination capabilities with regional data. The purpose was to develop discriminants with a well understood physical basis which could be reliably transported to different areas of the world. The study of P_{nl} involved adapting methods developed to fit long period data for observations with periods as short as two seconds. To accomplish this, we have modified the wavenumber integration method for efficient computation of P_{nl}. Velocity gradients like those typically observed near the free surface were of great importance. Gradients at lower depths such as at the crust-mantle transition are of much less significance. A simple layered model which accurately predicts regional P_{nl} propagation from NTS to the surrounding digital stations were developed. It deterministically explains the waveshape of the P_n and approximately the first 15 seconds of high amplitude energy reflecting past critical angle from the mantle. The modeling study of short period P_n has led to the development of an effective and physically based regional discriminant; the underlying purpose of this project. It has been found that the waveshape of the P_n is stable, similar at most stations and straightforward to model.

28972 (AD-A-216864/9/XAB) **Numerical modeling of Pn geometric spreading and empirically determined attenuation of Pn and Lg phases recorded in eastern Kazakhstan. Semiannual technical report No. 1, 1 January-30 June 1989.** Sereno, T.J. Science Applications International Corp., San Diego, CA (USA). Aug 1989. 124p. (SAIC-89/1555). Available from NTIS, PC A06/MF A01.

The overall goal of this work is to estimate the detection and location capability of actual and hypothetical networks of stations and arrays in and around the Soviet Union. These estimates require the simulation of the detection and location capability of the networks. This report summarizes two studies of important issues involved in the normalization of the simulations. The first is a theoretical study of the dependence of Pn geometric spreading on the velocity gradient in the upper mantle. This is important because most methods for estimating Pn attenuation require assumptions regarding geometric spreading. The second study is an empirical parameterization of regional wave spectra recorded near the eastern Kazakhstan nuclear explosion test site. The results are compared to results from a similar parameterization of data recorded by the NORESS array in Norway. Data recorded by the NORESS and ARCESS arrays are plentiful and provide an excellent basis for normalizing the simulations. Data recorded in eastern Kazakhstan are relatively few at this time, but can be used to see if the NORESS/ARCESS data can be used as a reasonable representation of conditions in this area.

28973 (UCRL-53944) **The role of bombers in a START-reduced force environment with strategic defense.** Barish, F.D. Lawrence Livermore National Lab., CA (USA). 13 Sep 1989. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008185. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The large reduction in strategic forces that may take place over the next several years, coupled with the potential deployment of some type of strategic defense, raises many questions with regard to the desirability of various elements of these forces. This report considers the relative role played by manned bombers in such a reduced force structure. It is shown that a key element in understanding this issue is the ratio of the number of critical targets to weapons for each side. Relative crisis stability is examined for different levels of this ratio. Depending on the ratio and the size of any defensive buildup, bombers can have either a stabilizing or destabilizing effect. In particular, relative crisis stability can be maintained in the early stages of a buildup in strategic defense by allowing for changes in the effectiveness of an existing bomber force. That is, interceptors and bombers could be added simultaneously in some ratio to be determined based on the calculated effectiveness of each. 5 refs., 10 figs., 2 tabs.

4505 Strategic Defense Initiative

28974 (LA-11716-MS) **Scaling of nonnuclear kinetic-energy antisatellites.** Canavan, G.H. Los Alamos National Lab., NM (USA). May 1990. 22p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE90009758. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Nonnuclear antisatellites could release particles in the paths of satellites. The antisatellite would have about a twofold mass advantage in attrition and about a tenfold advantage in suppression over the defensive satellite. Antisatellites would weigh 5–10 tons; satellite shields could weigh a factor of 2-4 less. Exchange ratios scale strongly on antisatellite mass, maneuver, and range. Such

antisatellites would be less effective against directed energy satellites, which could clear their paths or destroy the anti-satellites before deployment. 7 refs., 2 figs.

28975 (LA–11752-MS) **Target returns for neutral-particle-beam discrimination.** Canavan, G.H. Los Alamos National Lab., NM (USA). May 1990. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE90009759. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Models of weapons and decoys adequate for deposition studies can be formulated and solved analytically. Empirical conversion efficiencies predict useful weapon signals and weapon-to-decoy signal ratios for those energies of interest. Light decoys are of concern because of the numbers possible. Discriminating them on the basis of mass appears feasible with hydrogen or deuterium beams, contrary to earlier studies of much heavier decoys. 8 refs.

28976 (AD-A–216160/2/XAB) **Evaluation of the impact of meteorological restrictions on the TEAD Chemical Stockpile Disposal Program. Volume 1. Final report.** Flamm, K.J. Office of the Program Manager, Chemical Demilitarization, Aberdeen Proving Ground, MD (USA). 8 Sep 1989. 205p. (SAIL-PMV–89001A). Available from NTIS, PC A10/MF A02.

This document has been prepared in support of the Tooele Army Depot (TEAD) Site Specific Environmental Impact Statement (SSEIS) for the Chemical Stockpile Disposal Program (CSDP). This study evaluates the impact of TEAD site specific meteorological, geographical and chronological effects on the hazard distances resulting from the Credible Catastrophic Accidents (CCAs) used in the Final Programmatic Environmental Impact Statement (FPEIS). In addition, the study evaluates the impact on the total risk to the public by restricting or partially restricting disposal operations to the portion of the day when stable meteorological conditions do not exist.

28977 (AD-A–216734/4/XAB) **Risk analysis in support of the Chemical Stockpile Disposal Program. Volume 1. Analysis. Final report.** Fraize, W.E.; Cutler, R.; Duff, W.; Hughitt, E.; Perry, J. Mitre Corp., McLean, VA (USA). Civil Systems Div. 17 Dec 1987. 252p. (MTR–87W00230-VOL-1). Available from NTIS, PC A12/MF A02.

See also Volume 2, AD-A216 735.

This document has been prepared for the U.S. Army to support the Final Programmatic Environmental Impact Statement for the Chemical Stockpile Disposal Program (CSDP). This report presents the results of the integrated risk analysis of the CSDP - a continuation of the risk analyses prepared by GA Technologies Inc. for this same program. This report describes the risk analysis methodology, and presents the results of the risk analysis in a variety of ways, including: cumulative risk curves; expected fatalities values; individual risk data; estimates of time and person-years at risk; and, semi-quantitative picto-graphical comparisons of the major measures of both societal and individual risk. Differences in risk of the disposal alternatives are presented and discussed in light of the uncertainty in the analysis.

28978 (AD-A–216735/1/XAB) **Risk analysis in support of the Chemical Stockpile Disposal Program (CSDP). Volume 2. Consequence data.** Fraize, W.E.; Cutler, R.; Duff, W.; Hughitt, E.; Perry, J. Mitre Corp., McLean, VA (USA). Civil Systems Div. 17 Dec 1987. 495p. (MTR–87W00230-VOL-2). Available from NTIS, PC A21/MF A03.

28980 (AD-A–216690/8/XAB) **Boiler emission compliance survey, Norton AFB, California. Final report.** Attebery, C.W.; Vaughn, R.W. Air Force Occupational and Environmental Health Lab., Brooks AFB, TX (USA). Aug 1989. 176p. (AFOEHL–89-089EQ0144HEF). Available from NTIS, PC A09/MF A01.

At the request of USAF Clinic/SGPB, Norton AFB and HQ MAC/SG PB, compliance testing (carbon monoxide and oxides of nitrogen) of emissions from three Norton AFB boilers was conducted on 17-29 April 1989. Testing was performed to determine compliance with regards to the newly adopted Rule 1146 of the South Coast Air Quality Management District. In anticipation of further regulation. particulate emissions were also determined. Results show that none of the boiler emissions meet the 40 ppm limit for oxides for nitrogen but all meet the 400 ppm limit for carbon monoxide emissions.

28981 (AD-A–216823/5/XAB) **Multiple ignition, combustion, and quenching of hydrocarbon fuel sprays. Annual report.** Aggarwal, S.; Bishop, R.; Sirignano, W.A.; Sommer, H.T. Carnegie-Mellon Univ., Pittsburgh, PA (USA). Dept. of Mechanical Engineering. Dec 1981. 8p. Available from NTIS, PC A02/MF A01.

The objectives were to modify the experimental apparatus so that aromatic fuels such as toluene could be included in the program. It was also intended to continue the theoretical analysis of the ignition of gaseous mixtures and to begin the study of the heterogeneous mixture ignition. In the experiments methane and propane air ignition by burning aluminum particles were studied. In this period of research it was of interest to study the ignition limits of mixtures of air with the vapor of a volatile liquid fuel. This information expanded the data base relevant to ignition of liquid fuel sprays by burning metal particles. Theoretical work on the ignition of gaseous mixtures was completed during this period. Both computational and analytical studies were made. Since delivery of the gas mixtures and vapor mixtures to the combustion chamber were fundamentally different, several modifications to the existing apparatus were made to meet the new objectives of the program. It was of interest to be able to obtain a direct measurement of the temperature of the burning particle. Therefore, the possibility of outfitting the experimental apparatus with an optical pyrometer was examined.

28982 (ANL/ER–1) **Review of future plans of the MAP3S Precipitation Chemistry Network: Derived from a MAP3S workshop held April 18–20, 1989, Bethesda, Maryland.** Wesely, M.L. (Argonne National Lab., IL (USA). Environmental Research Div.); McNaughton, D.J.; Artz, R.S.; Gibson, J.H.; Hansen, D.A.; Stedman, D.H. Argonne National Lab., IL (USA). Environmental Research Div. Feb 1990. 59p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE90010154. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

A workshop was held in April 1989 to review the future plans of the MAP3S Precipitation Chemistry Network program sponsored by the Department of Energy (DOE). A panel of scientists reviewed options for future activities with regard to meeting the needs of DOE for health and environmental research. The panel concluded that the program should be redirected in the 1990s toward climate change research concerned with the effects of energy-related emissions on the extent of cloud cover and the optical properties of clouds. In addition, the panel found that current operations could be improved, more scientific analysis of the collected data should be conducted, and that the program should be considered as a

means of carrying out future research that might be needed to address new health and environmental issues. 37 refs., 5 tabs.

28983 (BMU–1988-236) **Concepts of computer-aided environmental radioactivity monitoring within the framework of the Integrated Measurement and Information System (IMIS) of the BMU.** Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten. Schmidt, F. Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme. Oct 1988. 85p. (In German). Contract BMU St.Sch. 1088. (IKE–4-128). Available from GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.).

This report contains the contributions of IKE to the design of the Integratedd Measurement and Information System (IMIS). Three contributions are included: 1. the general design of the system, 2. the detailed design of the methods to treat data which are measured by federal authorities; 3. the detailed design for the methods used by the BMU. (orig./HP).

28984 (BNL–44417) **Solving global environmental problems through technological innovation.** Steinberg, M. Brookhaven National Lab., Upton, NY (USA). Mar 1990. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-9002113–1: GISPRI symposium '90 meeting, Tokyo (Japan), 28 Feb 1990). Order Number DE90010018. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Much of the environment problems arise from the supply and utilization of energy for industrial, transportation and domestic markets. The use of fossil fuels can result in environmental, atmospheric, and terrestrial problems, including organic, acid rain, and global warming hazards. Here I will address the CO_2 global greenhouse problem and touch upon the nuclear industry and its dilemma as well. We recognize the possibility of global natural feedback phenomena which may limit and mitigate anthropomorphic global greenhouse climate change, however, here I am limiting the discussion to anthropomorphic (man made) technological mitigation process as opposed to adaptation which means adapting to change.

28985 (CIEMAT–635) **Measurement of radon daughters in air samples by alpha spectroscopy.** Acena, M.L.; Crespo, M.T. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas, Madrid (Spain). 1989. 26p. (In Spanish). Order Number DE90624489. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The concentration of radon progeny in air has been determined by alpha spectrometry measurement of polonium 214 and polonium 218. A known volume of air was passed through a filter, then the alpha activity was directly measured on this filter (Author).

28986 (CONF-9006117–4) **Experimental performance of ozone-safe alternative refrigerants: Experimental performance comparisons of R32, R125, R143a, R218, R134a, R152a, R134, R124, R142b, RC318 and R143 in a refrigeration circuit.** Sand, J.R. (Oak Ridge National Lab., TN (USA)); Vineyard, E.A.; Nowak, R.J. Oak Ridge National Lab., TN (USA). [1990]. 23p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From Annual meeting of The American Society of Heating, Refrigerating and Air-Conditioning Engineers; St. Louis, MO (USA); 9-13 Jun 1990. Order Number DE90009227. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Several compounds proposed as near term or longer range substitutes for the regulated chlorofluorocarbon (CFC) refrigerants were tested in a breadboard vapor-compression circuit, and their performance was evaluated relative to more commonly used refrigerants. The limited physical property information available in the literature for these alternative compounds was used to fit an equation of state so coefficients of performance (COPs) and capacities calculated from refrigerant property subroutines could be compared to those obtained experimentally. Comparisons of measured and modeled performance are given for 11 alternatives and for R22, R12, and R114. Estimates of compressor efficiency with each refrigerant are provided. Several of the alternatives exhibited better performance than the more widely used refrigerants at some or all of the conditions tested. Ozone-safe, alternative refrigerants that performed better than CFC counterparts at selected conditions are R152a, R143a, R134a, R134, and R142b. 9 refs., 1 fig., 8 tabs.

28987 (DOE/BP/63406–10) **Seasonal weather forecast verification: Final report.** Wade, J.E. (Oregon State Univ., Corvallis, OR (USA). Energy Resources Research Lab.); Walker, S.N.; Baker, R.W. USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Resource Management; Oregon State Univ., Corvallis, OR (USA). Energy Resources Research Lab. Feb 1990. 24p. Sponsored by U.S. DOE Management & Administration. DOE Contract BI79-86BP63406. (BPA–89-31). Order Number DE90009467. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The purpose of this report is to provide an assessment of how accurate seasonal weather forecasts are at the present and report on the prospects for forecast improvement. The report will discuss how the seasonal forecasts are made and used. The verification scheme used will also be described along with the results of the verification. The results will indicate that the accuracy of seasonal forecasts is not high. However, there is some evidence that forecast skill is better at specific sites and particularly for the winter season. New relationships observed between sea level temperatures, El Niño, and Pacific Northwest climate offer hope of better seasonal forecasts. The scope of this study did not allow investigation of the important aspect of the value of the seasonal forecast. 22 refs., 3 figs., 4 tabs.

28988 (DOE/NV–335) **A radiation briefer's guide to the PIKE Model.** Steadman, C.R. Jr. National Oceanic and Atmospheric Administration, Las Vegas, NV (USA). Weather Service Nuclear Support Office. Mar 1990. 165p. Sponsored by U.S. DOE Defense Programs. DOE Contract AI08-87NV10566. Order Number DE90009575. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

Gamma-radiation-exposure estimates to populations living immediately downwind from the Nevada Test Site have been required for many years by the US Department of Energy (DOE) before each containment-designed nuclear detonation. A highly unlikely "worst-case" scenario is utilized which assumes that there will be an accidental massive venting of radioactive debris into the atmosphere shortly after detonation. The Weather Service Nuclear Support Office (WSNSO) has supplied DOE with such estimates for the last 25 years using the WSNSO Fallout Scaling Technique (FOST), which employs a worst-case analog event that actually occurred in the past. The "PIKE Model" is the application of the FOST using the PIKE nuclear event as the analog. This report, which is primarily intended for WSNSO meteorologists who derive radiation estimates, gives a brief history of the "model," presents the mathematical, radiological, and meteorological concepts upon which it is based, states its limitations, explains it apparent advantages over more sophisticated models, and details how it is used operationally. 10 refs., 31 figs., 7 tabs.

28989 (EGG–10617-4101) **The value of on-site sodars versus nearest radiosonde soundings in regional emergency response modeling.** Baskett, R.L. (EG and G Energy Measurements, Inc., Pleasanton, CA (USA)); Nasstrom, J.S.; Lange, R. EG and G Energy Measurements, Inc., Pleasanton, CA (USA). [1990]. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-88NV10617. (CONF-900676–1: 83. annual meeting and exhibition of the Air and Waste Management Association, Pittsburgh, PA (USA), 24-29 Jun 1990). Order Number DE90008956. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Lawrence Livermore National Laboratory's Atmospheric Release Advisory Capability (ARAC) provides real-time emergency response support for accidental radiological releases to the atmosphere at Department of Defense and Energy facilities throughout the country. ARAC uses diagnostic three-dimensional dispersion modeling as its primary emergency response tool. The regional (20–200 km) modeling system is built around the MATHEW (Mass-Adusted THrEe-dimensional Wind field) and ADPIC (Atmospheric Dispersion Particle-In-Cell) models. It is essential for ARAC to know the accuracy and transferability of the MATHEW/ADPIC models to a wide variety of settings and meteorological conditions. Consequently, the models have been evaluated against numerous tracer studies over the last decade. This paper provides some recent case studies of

the model performance with a special focus on the wind input data. Real-time model initialization depends on readily available surface wind and upper air observations. Surface airways observations as well as rawinsonde soundings from civilian and military airports throughout the country provide the basic wind inputs for ARAC's models. ARAC receives and decodes these observations from the Air Force Global Weather center using extensive automated software at the LLNL ARAC Center. All ARAC-supported sites have at least hourly surface wind observations on-site. However, the standard twice-daily rawinsonde locations are frequently outside the modeling domain and may be up to 12 hours old, depending on the time of the calculation. 9 refs., 6 figs., 1 tab.

28990 (GSF–6/89, pp. 33-49) **Production, behaviour and deposition of gaseous, particulate, and droplet-shaped reaction products.** Dlugi, R. (Muenchen Univ. (Germany, F.R.). Meteorologisches Inst.); Meier, U.; Paffrath, M.; Quenzel, H. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Results from field studies to determine fluxes and budgets of different chemical compounds in the area 'Grosse Ohe', National Park 'Bavarian Forest' are presented. All deposition processes are influenced by meteorological, plant physiological and chemical processes. For hydrogen peroxide a flux from the atmosphere is determined but also the production inside the forest was observed. This shows an influence of the chemistry of ozone and monoterpenes. The fluxes of nitric and sulfuric acid are influenced by chemical reactions with ammonia. (orig.).

28991 (GSF–6/89, pp. 135-143) **Dynamics of humic substances in polluted forest sites. Experimental concept and preliminary results.** Beudert, G. (Bayreuth Univ. (Germany, F.R.). Lehrstuhl fuer Bodenkunde und Bodengeographie); Haumaier, L.; Zech, W. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

One of the subjects of the project 'dynamics of humic substances in polluted forest sites' is the effect of acid deposition on fluxes and chemical composition of dissolved organic substances in forest ecosystems. Therefore, concentrations and fluxes of dissolved organic carbon (DOC) are determined in precipitation, throughfall, mineral soil input, and output of two differently polluted and damaged spruce forests. In addition, dissolved organic matter is isolated, fractionated and characterized by ^{13}C NMR spectroscopy and chemical degradation. First results are reported. (orig./MG).

28992 (GSF–6/89, pp. 351-356) **The research concept for investigations of forests of the Northern Alps.** Rennenberg, H. (Fraunhofer-Institut fuer Atmosphaerische Umweltforschung (IFU), Garmisch-Partenkirchen (Germany, F.R.)). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

High concentrations of photooxidants transported above inversions layers are thought to be responsible for the non-biotic damage to the forests of the Northern Alps. At present this hypothesis is supported (1) by investigations on the atmospheric gas-mixing ratio of atmospheric pollutants, (2) the characteristics of the injury to the trees observed with increasing altitude, (3) the changes in the atmospheric gas-mixing ratio of ozone with increasing altitude, and (4) analysis of the detoxification capacity of spruce needles for toxic oxygen species. The impact of the observed local acidification of the soil as a factor of injury to the trees can presently not be evaluated. (orig.).

28993 (GSF–6/89, pp. 397-405) **Studies on the concentrations and enrichment of potentially phytotoxic organic pollutants in rain, cloud, and fogwater.** Herterich, R. (Bayreuth Univ. (Germany, F.R.). Lehrstuhl fuer Hydrologie); Herrmann, R. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Measurements of organic pollutants in rain, cloud- and fogwater indicate that among other phytotoxic compounds especially nitrated phenols reach deposition rates which can possibly exert harmfull effects on vegetation. We present a highly efficient fogwater collector and a wet deposition sampler for the analysis of organic trace substances. Their arrangement for comparative wet deposition studies in the Alpes and the Fichtelgebirge is shown. Preliminary results show maximum fogwater contaminations up to 2 μmolx1^{-1} for 4-nitrophenol and 4-nitrocresols including both pollutants. At highly exposed mountain sites deposition of these compounds into spruce stands via fogwater can reach several mgxm^{-2} within a period of 10 days. (orig.).

28994 (GSF–6/89, pp. 407-416) **Studies on ozone concentrations in air along two altitudinal transects in the Bavarian Alps and at a research tower in the Bavarian Forest National Park.** Werner, H. (Muenchen Univ. (Germany, F.R.). Lehrstuhl fuer Forstpflanzenzuechtung und Immissionsforschung). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

In the Seed and Cultivation Department of the University a passive ozoneintegrator has been tested and further developed. The test results of the original model and the improved model were presented, and the latest developments explained. Dry passive collectors up to factor 10 were determined to be more responsive than the moist types. The data were collected along two altitudinal transects on the Wank near Garmisch-Partenkirchen and at a research tower in Bavarian Forest National Park. On the tower and one of the Wank transects continuing measurements are also being made by other research groups and are available to us for comparison. (orig.).

28995 (Juel–2335) **Electrochemical detection and quantification of water-soluble oxidants in the atmosphere.** Gilge, S.; Volz-Thomas, A.; Kley, D. Kernforschungsanlage Juelich GmbH (Germany, F.R.). Inst. fuer Chemie 2 - Chemie der Belasteten Atmosphaere. Dec 1989. 60p. (In German). Order Number DE90773655. Available from NTIS (US Sales Only), PC A04/MF A01.

This report describes the development of a new analytical procedure for the measurement of H_2O_2 and other soluble oxidants in the atmosphere. The main goal was to develop an instrument that is light-weight and relatively simple to operate so that it can be flown on meteorological balloons. H_2O_2 and its organic homologues are formed in the atmosphere from the recombination of

peroxy radicals (HO_2 and RO_2). It is thus interesting for the understanding of the radical cycles. Because of its high solubility, H_2O_2 is considered to play an important role in the oxidation of SO_2 to H_2SO_4 in fog and cloud droplets. (orig.).

28996 (LA-UR-90-53) **The ASCOT 1988 valley/tributary interaction study.** Porch, W.M.; Clements, W.E. Los Alamos National Lab., NM (USA). [1990]. 32p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-9006111-1: 5. conference on mountain meteorology, Boulder, CO (USA), 26-29 Jun 1990). Order Number DE90009043. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper describes a regular oscillation observed in nighttime valley air flows under relatively light upper level wind conditions. The period of these oscillations is about 20 minutes with at least one harmonic at about 10 minutes. These oscillations are important to pollutant dispersion in valley flows at night. The strong coherence of tributary flow and main valley oscillations and the fact that tributary oscillations lead valley oscillation indicate the importance of tributaries as major contributors to the cold air flow in valleys. 13 refs., 12 figs.

28997 (ORNL/CDIAC-31) **Global and hemispheric annual temperature variations between 1861 and 1988.** Boden, T.A. (ed.) (Oak Ridge National Lab., TN (USA)); Jones, P.D.; Wigley, T.M.L.; Wright, P.B. Oak Ridge National Lab., TN (USA). Carbon Dioxide Information Analysis Center. Mar 1990. 82p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (NDP-022/R1). Order Number DE90007993. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Environmental Sciences Division Publication No. 3421.

This document presents two estimates of global and hemispheric annual temperature anomalies, relative to a 1950–79 reference period, for 1861–1988. In one set of estimates the influence of El Niño/Southern Oscillation (ENSO)-related events are considered. Both estimates are based on corrected land and marine data. These data are available free of charge as a numeric data package (NDP) from the Carbon Dioxide Information Analysis Center. The NDP consists of this document and a magnetic tape or floppy diskette containing machine-readable data files. This document provides tabular listings of the annual temperature anomalies, describes how the data were processed, defines limitations and restrictions of the data, and provides reprints of pertinent literature. 13 refs., 2 figs., 2 tabs.

28998 (PB-90-151457/XAB) **Effects of appliance type and operating variables on woodstove emissions. Volume 1. Report and appendices A-C. Final report, June 1987-May 1988.** Burnet, P.G.; Houck, J.E.; Roholt, R.B. OMNI Environmental Services, Inc., Beaverton, OR (USA). Jan 1990. 136p. Available from NTIS, PC A07/MF A01.

See also PB-90-151465.

The report gives results of a project, in support of the Integrated Air Cancer Project (IACP), to provide data on the specific effects of appliance type and operating variables on woodstove emissions. Samples of particulate material and volatile organic compounds (VOCs) were collected. Particulate samples were analyzed for different organic fractions including specific polynuclear aromatic hydrocarbon (PAH) compounds. Inorganic matter on the filters was also analyzed. Results were calculated for pollutant concentrations, emission rates, and emission factors. Twelve test runs were conducted on a conventional stove, and two on a catalyst-equipped stove. Operating variables included fuel type (oak and pine), altitude (80 and 800 m), and burn rate (high and low). Test data were analyzed using analysis of variance and linear regression procedures. Although the data do not show strong statistical significance due to variability of results, some general trends do appear to be present, and conclusions can be drawn as to the effects of various operating variables on woodstove emissions.

28999 (PB-90-151465/XAB) **Effects of appliance type and operating variables on woodstove emissions. Volume 2. Appendices D-F. Final report, June 1987-May 1988.** Burnet, P.G.; Houck, J.E.; Roholt, R.B. OMNI Environmental Services, Inc., Beaverton, OR (USA). Jan 1990. 266p. Available from NTIS, PC A12/MF A02.

29000 (PB-90-154592/XAB) **Institutional directory: Climate-related impacts network.** Krenz, M.E.; Stewart, D.J.; Chavez, B.G. National Center for Atmospheric Research, Boulder, CO (USA). Environmental and Societal Impacts Group. Jun 1989. 272p. Available from NTIS, PC A12/MF A02.

The institutional directory of groups, centers, institutes, and individuals involved in climate-related impacts research is an update of the initial network directory issued in 1985. The original directory had 26 listings; now there are about 160. The directory will be useful in maintaining a vital climate-related impacts research community and in establishing linkages among researchers and institutions. The directory was compiled by sending a questionnaire to all North American recipients of the Network Newsletter and assembling the information from those who responded.

29001 (PB-90-157108/XAB) **Determining the relative toxicity and smoke obscuration of combustion products of mine combustibles. Report of investigations/1990.** De Rosa, M.I.; Litton, C.D. Bureau of Mines, Pittsburgh, PA (USA). Pittsburgh Research Center. 1990. 19p. (BUMINES-RI-9274). Available from NTIS, PC A03/MF A01.

Combustible materials, when burned, produce toxic gases and smoke, which may vary dramatically from one material to another, with resultant different total toxicity and smoke obscuration levels. The U.S. Bureau of Mines report presents smoke property data acquired for a variety of mine combustibles and shows that there exists a correlation between the smoke properties, the relative toxicity, and the smoke obscuration levels of those combustibles tested. These correlations can be used to devise simple, standard tests for determining the toxic and smoke obscuration hazards of mine materials during fire.

29002 (PB-90-157512/XAB) **Monitoring of atmospheric particles and ozone in Sequoia National Park: 1985-1987. Final report.** Cahill, T.A. California Univ., Davis, CA (USA). Crocker Nuclear Lab. Jun 1989. 76p. Available from NTIS, PC A05/MF A01.

The Air Quality Group Monitored particles and ozone in Sequoia National Park as part of an effort to understand the impact of acid deposition and other air pollutants on the park's forests and watersheds. For high-elevation ozone measurement, the project developed a new solar-powered ozone monitoring system. The particulate matter sampled was analyzed for elemental content using nuclear techniques. The measurements were correlated with meteorology, known elemental sources, and wet and dry deposition measurements. The results show that particulate matter at Sequoia National Park is similar to that present at other sites on the western slope of the Sierra Nevada range at equivalent elevations. Some anthropogenic species, including nickel and sulfate, are present in higher concentrations at Sequoia than at Yosemite National Park.

29003 (PB-90-159112/XAB) **Chlorofluorocarbons (CFCs) and halons. Directive.** Kibler, D. Office of the Under Secretary of Defense (Acquisition), Washington, DC (USA). 13 Feb 1989. 6p. (DOD-D-6050.9). Available from NTIS, PC A02/MF A01.

The Directive establishes policy and assigns responsibilities for the management of CFCs and halons in the Department of Defense (DoD); the identification of CFC and halon applications and

prioritization of their uses; the long-term process of decreasing DoD dependence on CFCs and halons because of reduced availability in future years due to recently promulgated international and domestic production limits; research and development programs to develop or evaluate suitable substitutes for halons and other mission-critical CFC applications; and a tracking system to document DoD's annual requirements for CFCs and halons.

29004 (PB–90-160003/XAB) **Locating and estimating air emissions from sources of 1,3-butadiene. Final report.** Buchanan, S.K. Radian Corp., Research Triangle Park, NC (USA). Dec 1989. 161p. Available from NTIS, PC A08/MF A01.

To assist groups interested in inventorying air emissions of various potentially toxic substances, EPA is preparing a series of documents to compile available information on sources and emissions of these substances. The document deals specifically with 1,3-butadiene. Its intended audience includes Federal, State and local air pollution personnel and others interested in locating potential emitters of 1,3-butadiene and in making gross estimates of air emissions therefrom. The document presents information on the types of sources that may emit 1,3-butadiene, process variations and release points that may be expected within these sources, and available emissions information indicating the potential for 1,3-butadiene releases into the air from each operation.

29005 (PB–90-161068/XAB) **Conversion feasibility of the KILnGAS Commercial Module (KCM) to a hazardous-waste facility: A preliminary assessment.** Nakles, D.V.; Spanaus, D.D.; Garside, P.G.; Banks, R.R. Remediation Technologies, Inc., Pittsburgh, PA (USA). May 1989. 71p. Available from NTIS, PC A04/MF A01.

The study presents the results of a preliminary assessment of the feasibility of converting an existing kiln facility, the KILnGAS Commercial Module (KCM) in East Alton, Illinois, to a hazardous waste incinerator. The study examined the RCRA and Superfund waste volumes and characteristics as well as the treatment and disposal capacity of the State of Illinois to identify potential incineration capacity shortfalls. A centerline waste, soils contaminated with PCBs, was selected to provide a reference case to study the facility conversion. A conceptual facility design was developed using the technical and environmental criteria for the selected waste as a design basis. Major process equipment was identified, sized, and priced. A heat and material balance was developed for a centerline mode of operation to forecast performance. Economics for waste treatment were examined based upon a range of competitive tipping fees and other parameters impacting commercial viability. Finally, tentative conclusions regarding feasibility of the facility conversion are presented and a next step action plan is outlined to corroborate the technical, economic, and regulatory assumptions and to examine design alternatives with the potential for reducing facility costs and/or enhancing its performance or siting potential.

29006 (PB–90-161837/XAB) **Health-hazard evaluation report HETA 89-155-1979, Arcade Parking Garage, Providence, Rhode Island.** Kaiser, E.A. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Aug 1989. 17p. (HETA–89-155-1979). Available from NTIS, PC A03/MF A01.

The Arcade Parking Garage, in Providence, Rhode Island, was evaluated for possible hazardous health conditions due to the presence of carbon monoxide fumes. The garage has nine parking levels, eight above ground. The building was constructed of reinforced poured concrete and the above ground parking spaces were open to the outside, allowing the free circulation of air. Environmental monitoring consisted of carbon monoxide and carbon dioxide air sampling in a collection booth and in the office. The results of the short and long term air sampling indicated exposure to carbon monoxide ranging from 17 to 103 parts per million (ppm). Carbon-dioxide levels were measured at greater than 1000 ppm in the office area, indicating inadequate ventilation. The carbon dioxide levels were all well below the industrial standard of 5000 ppm, but were above the 1000 ppm indoor air quality guideline. Measurements for thermal comfort indicated temperatures were between 62 and 65 F, with relative humidities ranging from 28.3 to 43.7%. These thermal-comfort values were within the guidelines for human occupancy. The reported symptoms of the employees were consistent with carbon monoxide exposure. A potential health hazard existed due to carbon monoxide. Measures to minimize employee exposures are recommended.

29007 (PB–90-161845/XAB) **Health-hazard evaluation report HETA 89-142-1981, Seagull Industries, West Balm Feach, florida.** Roper, P. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Aug 1989. 16p. (HETA–89-142-1981). Available from NTIS, PC A03/MF A01.

Seagull Industries for the Disabled, Inc., West Palm Beach, Florida was evaluated for exposure to silica dust and lead paints in the ceramics area and to solvents in the assembly building. Seagull Industries is a private, nonprofit corporation providing job training and employment, primarily for the mentally regarded. Airborne lead concentrations at the facility were extremely low, ranging from 0.9 to 1.8 micrograms per cubic meter of air (microg/cu m). However, the settled dust on the painters' table tops was 10% lead, which posed some concern for accidental ingestion. Silica exposures in the ceramics polishing area were more significant with measurements of 48 and 64 microg/cu m for the 6 hour work period. If these exposures were adjusted for an 8 hour time weighted average, the levels would be equivalent to 36 and 48 microg/cu m which was slightly less than the National Institute for Occupational Safety and Health recommended limits. Solvent vapor concentrations were minimal during the cleaning of the printing press, due to the fact that there was sufficient natural ventilation. Silica dust levels were significant, and lead dust on table tops may present an ingestion hazard. Measures to control silica and lead exposures and to reduce fire hazards associated with the use of flammable solvents are recommended.

29008 (PB–90-162447/XAB) **In-depth survey report of Roadway Express, Inc., Toledo, Ohio.** Zaebst, D.D.; Ringenburg, V.; Sanderson, W. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). 9 Sep 1989. 48p. (IWS–146.22). Available from NTIS, PC A03/MF A01.

An in-depth survey was conducted at Roadway Express, Inc., Toledo, Ohio to determine relative exposures to diesel aerosols among the four major presumably exposed job groups of road drivers, local drivers, dock workers, and mechanics. Element carbon sampling results at the Roadway terminal in Toledo, Ohio, during cold weather indicated low level exposures only slightly above geometric mean ambient residential and highway background concentrations in road drivers and local drivers. Exposures were significantly above background highway concentrations in dock workers and in mechanics, with exposures of 29 and 58 micrograms/cubic meter (microg/cu m), respectively. The highest levels of exposure were to mechanics working in the shop. Exposure to nitrogen oxides and respirable particulates were far below recommended limits. The major source of exposures in dock workers appeared to be the operation of diesel powered fork lift trucks on the dock. The principal source in mechanics was the entry and egress of diesel tractors to and from the shop area, but the more enclosed environment in which they were working exacerbated concentrations of diesel aerosols.

29009 (PB–90-162462/XAB) **Determination of asbestos levels in a public building located in Towson, Maryland.** Wallingford, K.M.; Bierbaum, P.J.; Dement, J.M. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Field Studies and Clinical Investigations. 25 May 1973. 18p. Available from NTIS, PC A03/MF A01.

In response to a request from the Baltimore County Health Department, a study was made of possible exposures to asbestos in a public building in Towson, Maryland. Determinations were made of asbestos in bulk ceiling samples and airborne samples. The building had two levels. The ground level houses the local fire department and the basement level houses the Bureau of Civil Defense. Asbestos was applied to the ceiling of the basement level to help alleviate a heat problem caused by the heating facility located on the ground floor, directly above the civil defense offices. The material, Spraycraft Asbestos Fiber, was applied in two layers. The x-ray diffraction study of the bulk ceiling sample indicated a chrysotile asbestos content of 27%, by weight. Concentrations in airborne samples ranged from 0.0 to 0.0031 fibers/milliliter, which were quite low compared to the 1976 standard 8 hour exposure of

2 fibers/milliliter. Due to the potential for flaking of the ceiling material with subsequently increased employee exposure, the authors recommend that appropriate action be taken to prevent this from occurring.

29010 (PB–90-164526/XAB) **Evaluation of the RADM (Regional Acid Deposition Model) gas-phase chemical mechanism. Final report, September 1987-January 1989.** Carter, W.P.L.; Lurmann, F.W. California Univ., Riverside, CA (USA). Statewide Air Pollution Research Center. Feb 1990. 408p. Available from NTIS, PC A18/MF A03.

Results are presented of a program to independently evaluate the gas phase mechanism developed for use in the second version of the Regional Acid Deposition Model (RADM-II). The RADM mechanism was tested by comparing predictions against results of over 550 environmental chamber experiments carried out at the University of California at Riverside and at the University of North Carolina. Statistical summaries of the overall results and results for individual experiments are presented and discussed. A series of 90 test problems for use in sensitivity calculations to assess effects of alternative assumptions for gas-phase mechanisms used in regional models was also developed and used to test several condensation approaches for the RADM mechanism. As a result of the evaluation against chamber data and the sensitivity test calculations, recommendations were made for modifications to the RADM mechanism. Two modified RADM mechanisms, one involving primarily changes in parameter values and one where more extensive changes and use of fewer model species are involved, were developed. These modified mechanisms and their performance in simulating the chamber data and the sensitivity test problems are discussed.

29011 (PB–90-164542/XAB) **Effects of hydroxymethanesulfonate on airway function in subjects with asthma. Final report.** Sheppard, D.; Balmes, J.R.; Aris, R.M.; Christian, D. California Univ., San Francisco, CA (USA). Lung Biology Center. 30 Jun 1989. 43p. Available from NTIS, PC A03/MF A01.

The organic ion hydroxymethanesulfonate (HMSA) has been measured in micro-molecular concentrations in acidic fogs in southern California. HMSA is a stable adduct in fogs with a pH range of 3-5, but it is likely to dissociate at pH 6.6, the pH of the human airways fluid lining. It was hypothesized that HMSA may have a specific bronchoconstrictor effect because HMSA may dissociate in the airway lumen generating SO_2 and CH_2O, both of which have bronchoconstrictor potential. In order to determine whether HMSA has such an effect, a total of 19 subjects with mild to moderate asthma were studied in an exposure chamber in which freely breathing and exercising subjects inhaled simulated fogs containing HMSA at a concentration (1000 micro M) higher than the ambient levels for 1 hour. The results indicated no significant bronchoconstrictor effect for acute exposures of HMSA.

29012 (PB–90-164831/XAB) **Annual report on performance audit results for POHC (Principal Organic Hazardous Constituents) testing during RCRA (Resource Conservation and Recovery Act) trial burns. Status report No. 2.** Jayanty, R.K.M.; Tompkins, S.B.; Bryant, V.R.; Howe, G.B. Research Triangle Inst., Research Triangle Park, NC (USA). Dec 1989. 68p. Available from NTIS, PC A04/MF A01.

See also PB–89-161970.

Audit materials containing Principal Organic Hazardous Constituents (POHSc) have been developed by AREAL for use by federal, state, and local agencies or their contractors to assess the accuracy of measurement methods during Resource Conservation and Recovery Act (RCRA) trial burn tests. Audit materials are currently available for 27 gaseous organics in 5, 6, 7, and 9 component mixtures at parts-per-billion levels (7 to 10,000 ppb) in compressed gas cylinders in a balance gas of nitrogen. The criteria used for the selection of gaseous organic compounds is described. Stability studies indicate that all of the organics tested (with the exception of ethylene oxide and propylene oxide below 10 ppb levels) are stable enough to be used as reliable audit materials. Subsequent to completion of the stability studies, 202 performance audits have been initiated with the audit materials to assess the accuracy of the Volatile Organic Sampling Training and bag measurement methods during or prior to RCRA trial burn tests. Results of those audits and a summary table of the audit conducted for each POHC and the measurement system audited is described in the report. Audit results obtained with the audit bases during or prior to RCRA trial burn tests are generally within + or - 50% of the audit concentrations.

29013 (PB–90-168030/XAB) **Ambient monitoring guidelines for Prevention of Significant Deterioration (PSD).** Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards. May 1987. 97p. (EPA–450/4-87/007). Available from NTIS, PC A05/MF A01.

Ambient air monitoring guidelines are described for sources that may be required to monitor the air quality under the Prevention of Significant Deterioration (PSD) regulations. Some step-by-step discussion is presented for a source to determine if monitoring will be necessary. Situations where existing air quality and meteorological data, modeling, and use of assumed background concentrations for certain areas may be used in lieu of monitoring, are shown. If a source must undertake a monitoring program, general guidance is given for pollutants to be monitored, number and location of monitoring sites, equipment, frequency and duration of sampling, and data reporting. More detailed guidance is discussed for air quality monitoring probe siting criteria for various pollutants, meteorological monitoring, and quality assurance procedures.

29014 (PB–90-168501/XAB) **Control of asbestos exposure during brake drum service.** Sheehy, J.W.; Cooper, T.C.; O'Brien, D.M.; McGlothlin, J.D.; Froehlich, P.A. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Physical Sciences and Engineering. Aug 1989. 81p. (DHHS/PUB/NIOSH–89-121). Available from NTIS, PC A05/MF A01.

Also available from Supt. of Docs.

Earlier studies of airborne asbestos exposure to mechanics during brake maintenance operations showed overexposure to asbestos fibers during brake servicing, especially brake assembly cleaning. Because an estimated 150,000 brake mechanics and garage workers in the U.S. are potentially exposed to asbestos, a known carcinogen, and the lack of information available on the effectiveness of available controls, an evaluation of these methods was initiated. Detailed field surveys were conducted at five facilities employing five methods for controlling exposure to asbestos during brake repair. These included the use of two commercial enclosure devices with ventilation provided by HEPA filter-equipped vacuum, a HEPA filter-equipped vacuum alone, a brush with recirculating cleaning solution, and cleaning solvents in aerosol cans. These controls were evaluated while servicing brakes to automobiles, pickup trucks, vans, and vehicles with a 4-wheel rear axle. Detailed evaluations of these control measures involved a program consisting of traditional air sampling methods, incorporating phase contrast microscopy (PCM) and transmission electron microscopy (TEM), and a real-time analysis of brake dust exposure. Personal and area air samples were collected during brake repair to each vehicle.

29015 (PB–90-169954/XAB) **OAQPS (Office of Air Quality Planning and Standards) control cost manual (fourth edition).** Vatavuk, W.M. Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards. Jan 1990. 282p. (EPA–450/3-90/006). Available from NTIS, PC A13/MF A02.

See also PB–87-166583.

The Manual compiles up-to-date capital costs, operating and maintenance expenses, and other costs for add-on air pollution control systems and provides a comprehensive, concise, consistent, and easy-to-use procedure for estimating and (where appropriate) escalating these costs. (Add-on systems are those installed downstream of an air pollution source to control its emissions.) The Manual estimating procedure rests on the notion of the factored or study estimate, nominally accurate to within + or - 30%. This type of estimate is well suited to estimating control system costs intended for use in regulatory development. Study estimates are sufficiently accurate, yet do not require the detailed, site-specific data inputs needed to make definitive or other more accurate types of estimates.

29016 (PB–90-860875/XAB) **Ozone in the stratosphere. May 1982-January 1990 (A Bibliography from the NTIS data base).**

Report for May 1982-January 1990. National Technical Information Service, Springfield, VA (USA). Feb 1990. 127p. Available from NTISPC N01/MF N01.

Supersedes PB-88-868237.

This bibliography contains citations concerning empirical and theoretical studies and analyses of stratospheric ozone. The studies cover data collection and processing of upper atmospheric ozone concentrations. The concentrations vary with ozone transport, formation, and depletion. Data collection is performed using ground-based, airborne, and satellite-borne instrumentation and sensors. The theoretical studies include atmospheric composition, reaction kinetics, particle physics, chemical reactions, photochemistry, and atmospheric models of ozone. The investigations are based upon both the theory of photochemistry and constituents, and on analysis and comparisons of long-term measurement data. Several articles cover the Antarctic October depletion phenomenon. (This updated bibliography contains 227 citations, 55 of which are new entries to the previous edition.)

29017 (PNL-7208) **1987 wet deposition temporal and spatial patterns in North America.** Simpson, J.C.; Olsen, A.R. Pacific Northwest Lab., Richland, WA (USA). Mar 1990. 222p. Sponsored by Environmental Protection Agency. DOE Contract AC06-76RL01830. Order Number DE90010239. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

The focus of this report is on North American wet deposition temporal patterns from 1979 to 1987 and spatial patterns for 1987. The report investigates the patterns of annual precipitation-weighted average concentration and annual deposition for nine ion species: hydrogen, sulfate, nitrate, ammonium, calcium, chloride, sodium, potassium, and magnesium. Data are from the Acid Deposition System (ADS) for the statistical reporting of North American deposition data which includes the National Atmospheric Deposition Program/National Trends Network (NADP/NTN), the MAP3S precipitation chemistry network, the Utility Acid Precipitation Study Program (UAPSP), the Canadian Precipitation Monitoring Network (CAPMoN), and the daily and 4-weekly Acidic Precipitation in Ontario Study (APIOS-D and APIOS-C). Mosaic maps, based on surface estimation using kriging, display concentration and deposition spatial patterns of pH, hydrogen, sulfate, nitrate, ammonium, and calcium ion species for 1987 annual, winter, and summer periods. The temporal pattern analyses use a subset of 39 sites over a 9-year (1979–1987) period and an expanded subset of 140 sites with greater spatial coverage over a 6-year (1982–1987) period. 68 refs., 15 figs., 15 tabs.

29018 (PNL-7311) **Guidance manual on the estimation of airborne asbestos concentrations as a function of distance from a contaminated surface area for area suspension evaluations.** Stenner, R.D.; Droppo, J.G.; Peloquin, R.A.; Bienert, R.W.; VanHouten, N.C. Pacific Northwest Lab., Richland, WA (USA). Apr 1990. 102p. Sponsored by Environmental Protection Agency. DOE Contract AC06-76RL01830. Order Number DE90009627. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This Guidance Manual provides a quantitative approach for estimating the airborne concentrations of asbestos from disturbed soils and surfaces. Asbestos-containing surfaces may include roads surfaced with asbestos-bearing serpentine rock, tailings piles, and landfills. This manual identifies the procedures necessary for estimating airborne concentrations of asbestos in disturbed soils. The manual is to be used in conjunction with the Airborne Asbestos Concentration Estimator System-Area Suspension (AACES-AS) computer code. 44 refs., 16 figs., 7 tabs.

29019 (PNL-7312) **Guidance manual on the estimation of airborne asbestos concentrations as a function of distance from a contaminated roadway for roadway screening.** Stenner, R.D.; Droppo, J.G.; Peloquin, R.A.; Bienert, R.W.; VanHouten, N.C. Pacific Northwest Lab., Richland, WA (USA). Apr 1990. 57p. Sponsored by Environmental Protection Agency. DOE Contract AC06-76RL01830. Order Number DE90009626. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This Guidance Manual provides a quantitative approach for estimating, for the purpose of screening/ranking, the airborne concentrations of asbestos from roads surfaced with asbestos-bearing serpentine rock. This manual identifies the procedures necessary for estimating screening-level airborne concentrations of asbestos in disturbed soils associated with roadways whose surfacing material contains asbestos fibers. The manual is to be used in conjunction with the Airborne Asbestos Concentration Estimator System-Roadway Screening (AACES-RS) computer code. 12 refs., 11 figs., 4 tabs.

29020 (STEV-1989-R6) **Carbon dioxide from fossils combustion: Possibilities to reduce or deposite the carbon dioxide.** Dahl, A. (EnerChem AB, Lund (SE)). Statens Energiverk, Stockholm (Sweden). 12 Mar 1989. 67p. (In Swedish). Project STEV-413-801. Order Number DE90770765. Available from NTIS (US Sales Only), PC A04/MF A01.

A literature study on carbon dioxide and the greenhouse effect. The main part of the report is a review of processes for separation of carbon dioxide from the flue gases and methods to dispose of it. The cost of these processes is reported. Information is also given on methods to reduce CO_2 production in energy conversion. (With 37 refs.).

29021 (STEV-FBT-89-47) **Sampling dioxin.** Rappe, C. (Umeaa Univ., Umeaa (SE)); Marklund, S. Statens Energiverk, Stockholm (Sweden). Aug 1989. 41p. (In Swedish, English). Project STEV-276-302. Order Number DE90770791. Available from NTIS (US Sales Only), PC A03/MF A01.

A new simplified sampling method for dioxins etc. has been developed at the university of Umeaa. Comparative studies of five different sampling trains show the same results for all outfits provided a sufficient number of sampling spikes are added. (12 figs., 13 refs.).

29022 (SVF-351) **Methods of simultaneous reduction of SO_2 and NO_x.** Jantze, U. (TVE AB, Stockholm (SE)); Persson, Karin. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Sep 1989. 108p. (In Swedish). Order Number DE90770843. Available from NTIS (US Sales Only), PC A06/MF A01.

This report deals with the experiences from commercial processes for simultaneous sulphur and NO_x removal, mainly based on activated coke and catalytic reduction/oxidation. The Walther and SHL processes are briefly illuminated. The first demonstration plants are now in operation. In most of the plants initial problems have occurred. After solving these troubles the plants have worked satisfactorily and guaranteed emission values have in most cases been fulfilled. Possible removal degrees for SO_2 and NO_x in catalytic reduction/oxidation processes are over 95 % and about 90 % respectively. The processes are of particular interest for plants using high sulphur fuels. This depends partly on that the operation costs decrease and partly on a better heat economy. The investment costs can be higher compared with SCR and conventional flue gas desulphurization. It is considered that lower operation costs compensate for the higher investment costs. However, the costs varies depending on application and size of the plant. Continuous development and improvements of the processes proceed. Performance and economy can be improved by more efficient catalysts and improved reactor design. Further development is expected to reduce the costs in the future. (42 figs., 4 tabs., 42 refs.).

29023 (SVF-353) **Reduction of sulfur emission through lime/limestone furnace injection.** Eklund, R.B. (Goetaverken Energy AB, Goeteborg (SE)). Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Oct 1989. 58p. (In Swedish). Order Number DE90770844. Available from NTIS (US Sales Only), PC A04/MF A01.

The main purpose of this project was to evaluate the efficiency of commercial available lime sources, limestone, dolomite or hydrated lime for the reduction of sulfur dioxide emission by furnace injection. All the experimental results indicate that a very fast and efficient mixing of absorbent and furnace gases is of vital importance. Experiments performed at different furnace levels indicate that furnace gas temperature has a great influence on absorption efficiency. Retention time in the furnace as well as the sulfur dioxide level of the furnace gases has little or only minor influence on the efficiency of the absorbent. The gas temperature in the furnace at the sorbent injection level has a marked influence on the absorption of sulfur dioxide. Based on calcium content of the absorbent, hydrated lime and finely ground dolomite indicate the

same efficiency at a temperature around 1000 deg C of 18 to 20 % sulfatation of the injected amount of calcium. Limestone of low geological age can reach the same efficiency, but only if ground to a very small particle size, normally not commercially available. At higher temperature level the efficiency decreases. But dolomite of small particle size indicates an efficiency of about 12.5 %, even at temperatures above 1300 deg C. Injection of lime/limestone or dolomite does not influence the NO_x content of the stack gases.

29024 (SVF–354) **Report on 1989 joint symposium on stationary combustion NO_x control.** Hjalmarsson, A.K. (Aaf Energikonsult, Stockholm (Sweden)). Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Oct 1989. 60p. (In Swedish). (CONF-890318–Summ.: Joint symposium on stationary combustion nitrogen oxide control, San Francisco, CA (USA), 6-9 Mar 1989). Order Number DE90770845. Available from NTIS (US Sales Only), PC A04/MF A01.

The conference, arranged by the Electrical Power Research Institute (EPRI) and US Environmental Agency (EPA) covered over 60 papers. To reduce NO_x emissions, the first measure is usually combustion control. Techniques were presented for coal-fired boilers with tangential firing systems that are expected to give emissions in the range of 100-125 mg NO_2/MJ and with reburning (MACT) 46-65 mg NO_2/MJ. For wall-fired boilers, techniques were presented that give emissions in the range of 150-350 mg NO_2/MJ. The NO_x emissions from a coal gasification plant has been measured to be in the range of 25-50 mg/MJ. Using commercial techniques for NO_x control on gas turbines a level of 50-125 mg NO_2/MJ can be reached with gas firing, and 80-250 mg NO_2/MJ for oil-firing. SCR is the most common flue gas cleaning technique. Results of 50 % NO_x reduction are reported for SNCR systems. There are a large number of SCR plants in operation in Europe. Reports were given from SCR plants that have been operating over two years that the guarantees have been met. Problems were reported from Germany with too high concentrations of ammonia in the fly ash (to use the fly ash in the cement industry) if the ammonia slip is over 5 ppm. The cost of catalysts has been reduced over the last few years in Germany and is now only one third of the cost for the first installations.

29025 (SVF–358) **Investigation of the ability of different sorbent combinations to reduce hydrochloric acid and sulphur dioxide and influence on the production of dioxines during incineration of refuse derived fuels.** Rudling, L. (Studsvik Energy, Nykoeping (Sweden)). Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Nov 1989. 62p. (In Swedish). Order Number DE90770842. Available from NTIS (US Sales Only), PC A04/MF A01.

In order to decrease the emission of hydrochloric acid and sulphur dioxide during incineration of refuse derived fuels, it has been investigated if a simultaneous injection of dry calcium sorbents in the furnace and after the convective part of the boiler, will give a better reduction compared to injection of sorbent only in the furnace or after the boiler. The results show that a combined injection of calcium hydroxide gave a better reduction of hydrochloric acid and sulphur dioxide, 87 % and 70 % respectively, compared to 78 and 20 % respectively when the sorbent was injected after the boiler. The total excess of calcium was the same in both cases (mole Ca/mole S+Cl/2). Concerning the production of dioxines, measured as TCDD-equivalents, the results showed that with a simultaneous injection of calcium hydroxide in the furnace and after the boiler, the production of dioxines decreased with 50 % compared to the production of dioxines without addition of any sorbent. However, the emission of dioxines in the clean gas after the electrostatic precipitator was at the same level - 2 ng TCDD-equivalents/nm^3 dry gas at 10 % CO_2 - irrespective if any sorbent was added or not. The emission of nitrogen oxides, 170 ppm NO_x and 10-20 ppm N_2O at 6 % O_2, was not influenced by any addition of sorbents. (author).

29026 (SV-UL–1989-51) **Flue gas analysis with DOAS-technique: Experiences from a test period with the Opsis measuring system.** Sjoeberg, M. Swedish State Power Board, Vaellingby (Sweden). 25 Oct 1989. 22p. (In Swedish). Order Number DE90770798. Available from NTIS (US Sales Only), PC A03/MF A01.

Emissions from fossil fueled power plants were studied using Differential Optical Absorption Spectroscopy. Nitrogen oxides and sulfur dioxide were measured and compared to results from other measuring methods and calculated values.

29027 (UCRL-CR–103232) **Computer simulation of ionospheric radio frequency heating.** Close, R. (California Univ., Los Angeles, CA (USA). Dept. of Physics); Bauer, B.S.; Wong, A.Y.; Langdon, A.B.; Kruer, W.L.; Mjoelhus, E. Lawrence Livermore National Lab., CA (USA); California Univ., Los Angeles, CA (USA). Dept. of Physics; Tromsoe Univ. (Norway). 1 Dec 1989. 34p. Sponsored by U.S. Department of Defense; U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. ONR-N00014-78-C-0754;ONR-TPSU-UCLA-0677-387. Order Number DE90009478. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Linear and nonlinear absorption of electromagnetic waves in a warm, magnetized, nonuniform plasma is studied using an electromagnetic particle simulation code (ZOHAR) with either 1 or 2 spatial and 3 velocity dimensions. With fixed ions, finite temperature, and finite wave amplitude, transmission of the ordinary mode to the slow extraordinary wave (Z mode) is found to agree with cold plasma theory for linear conversion, and interference of mode converted waves is observed. With mobile ions and a parabolic density profile which peaks at the critical layer ($\omega_p = \omega$), the wave electric field is enhanced (factor of ten or more) near the critical layer where the wave becomes electrostatic, and small-scale density fluctuations (cavitons) are observed ($\delta\ell \approx 10\lambda_D$; $\delta n/n \approx 0.1$), typical of strong Langmuir turbulence. Wave damping and particle acceleration are also observed. Application to ionospheric heating is discussed. 15 refs., 23 figs., 1 tab.

29028 (UCRL-JC–103166) **GCM [general circulation model] predictions for surface air temperature and precipitation over the southeastern United States.** Grotch, S.L. Lawrence Livermore National Lab., CA (USA). Mar 1990. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-900255–2: Southeast regional climate symposium: global change - a southern perspective, Charleston, SC (USA), 19-22 Feb 1990). Order Number DE90009434. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

For regional assessments of the effects of possible global climate change due to increasing greenhouse gases, two of the most significant variables predicted by general circulation models (GCMs) are surface air temperature and precipitation. In an earlier Department of Energy report, the results from four GCMs and several historical climate data sets for each of these variables (both seasonally and annually averaged) were intercompared over different regional scales using a variety of techniques. In the work reported here, several more recent, higher resolution simulations are included and attention is focused primarily on the southeastern United States. Two graphical/statistical techniques are applied: cuts intercomparing model/historical data predictions at both fixed latitudes and longitudes and side-by-side boxplots showing the quartiles of the distributions for a particular variable for a selected subset of gridpoints in a specified region. 4 refs., 11 figs.

29029 (VTT-SYMP–103, pp. 253-264) **Volatilisation and removal of trace metals at high temperatures.** Mojtahedi, W. (Technical Research Centre of Finland, Espoo (Finland). Laboratory of Fuel Processing and Lubrication Technology); Mroueh, U.-M. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). 1989. (CONF-8806445–Vol.2: Seminar on non-waste technology, Espoo (Finland), 20-23 Jun 1988). In *Non-waste technology: Volume 2.* Order Number DE90748455. Available from NTIS (US Sales Only), PC A16/MF A01.

Granular-bed filtration is investigated as an alternative to the more conventional removal systems (such as ESP and bag-filters). It is generally believed that none of these conventional devices is capable of operating at high temperatures. Moreover, a sizeable proportion of the volatilised trace metals in combustion and gasification processes will exit from the reactor in the vapour phase and these purification devices are not designned to remove the gaseous species. An inert gas such as nitrogen is heated and passed through two externally heated tubes, the first containing a metal-compound (to be investigated), volatilising some of the compound at ppm level. The gas then passes through a bed of solid

particles placed on a porous plate positioned in the second tube. The gas is sampled just above and below the second tube simultaneously for the trace metal content and analysed. The removal mechanism and efficiency is investigated under varying conditions of temperature and residence time for different solid adsorbents.

29030 (VTT-TUTK–663) **Trace elements removal from hot flue gases.** Wahab, M. (Valtion teknillinen tutkimuskeskus, Espoo (Finland). Polttoainejalostustekniikan laboratorio); Mroueh, U.M. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Nov 1989. 78p. Order Number DE90770755. Available from NTIS (US Sales Only), PC A05/MF A01.

Granular-bed filtration was investigated theoretically and experimentally with the view to its applicability to gaseous trace element removal at high temperatures. Granular-bed filters have received a great deal of attention recently as an alternative to the more conventional gas cleanup devices such as cyclones, electrostatic precipitators (ESP) and bag-filters. None of these conventional devices is capable of operating efficiently at high temperatures, (800-900 deg C), typical combined-cycle power generation plants. Moreover, a sizeable proportion of the volatilised trace metals will exit from the reactor in the vapour phase and these purification devices are not generally designed to remove the gaseous species. In an atmospheric test rig, trace elements of concern were removed in a fixed granular-bed filter at 800-900 deg C temperature range using sorbent particles (such as limestone) as the unbonded filter medium. Two configurations of the experimental apparatus were employed to enable an accurate determination of the removal efficiency of various sorbent particles. The results show that volatilised trace elements can be effectively removed from hot flue gases by passing them through a fixed bed of suitably selected solid sorbents. Removal efficiencies of higher than 99% were achieved with solid sorbent particles in the 0.3-3.0 mm size range, operating at 800-900 deg C.

29031 Alternative venting methods for residential oil heating systems. Volume 5. Batey, J.E. (Steven Winter Associates, Inc., New York, NY (US)); McDonald, R.J.; Butcher, T.A. 15p. Air Pollution Control Assoc., Pittsburgh, PA (USA) (1988). (CONF-880679–: 81. annual meeting of Air Pollution Control Association, Dallas, TX (USA), 19-24 Jun 1988).

88-90.5.

This paper presents an overview of conventional chimney venting techniques including a review of operational problems. These include induced outdoor air infiltration into the building and undesired transient effects that can increase soot and incomplete combustion product emissions, and increase annual fuel use. Alternative venting methods are introduced and some important operational advantages are discussed. Practical concerns regarding new venting methods are briefly introduced. Research design and development activities needed to successfully apply alternative venting options are discussed.

29032 Advanced technologies for reduced CO2 emissions. Volume 5. Steinberg, M. (Brookhaven National Lab., Upton, NY (USA)); Cheng, H.C. 16p. Air Pollution Control Assoc., Pittsburgh, PA (USA) (1988). (CONF-880679–: 81. annual meeting of Air Pollution Control Association, Dallas, TX (USA), 19-24 Jun 1988).

88-87.3.

It appears that there has been an increase in concentration of carbon monoxide in the atmosphere over the past 125 years. This has been generally attributed to the exponential growth in the use of fossil fuel resulting in the release of fossil carbon as CO2 and the deforestation or the leveling of forests around the earth which reduced the photosynthetic utilization of atmospheric CO2. This paper presents studies conducted for the Carbon Dioxide Research Division (CDRD) of the U.S. Department of Energy relating to possible mitigation technologies which would tend to reduce CO2 emissions in the future.

29033 The trade off between the complexity, input data and scale of application of the RAINS-Lake model: A statistical analysis. Volume 6. Hettelingh, J.-P. (International Institute for Applied Systems Analysis, Laxenburg, (AT)); Gardner, R.H. 16p. Air Pollution Control Assoc., Pittsburgh, PA (USA) (1988). (CONF-880679–: 81. annual meeting of Air Pollution Control Association, Dallas, TX (USA), 19-24 Jun 1988).

88-104.1.

To use a complex, process oriented site model for predicting broad-scale environmental effects assumes the availability of a large, quality data base for calibrating the model and the validity of the process of extrapolating site-specific results to a larger region. The greater the level of extrapolation the more error prone the model results may become. A simplified version of a complex process oriented RAINS Lake Model (RLM) was developed by regression methods to quantify these extrapolation errors. RLM variables that explain more than 1% of the variation in the model output (pH of 1980) were selected and calibrated to the measured pH distribution in 1980 in the southern region of Finland from 1920 to 1980. An iterative procedure was then used to select the minimum number of variables which best represented the behavior of the RLM. The results show that extreme regional characteristics may necessitate adaptation of a simplified model that has been calibrated in a less extreme regional context.

29034 Examination of the relationship between Navajo generating station emissions and aerosol concentrations at Page, Arizona. Volume 3. Iyer, H.K. (Colorado State Univ., Fort Collins, CO (USA)); Malm, W.C. 19p. Air Pollution Control Assoc., Pittsburgh, PA (USA) (1988). (CONF-880679–: 81. annual meeting of Air Pollution Control Association, Dallas, TX (USA), 19-24 Jun 1988).

88-52.4.

Identifying the chemical/physical characteristics and source of pollutants contributing to low lying wintertime layered hazes in the canyons along the Colorado River where it cuts through the Colorado River Plateau area is one objective of the subregional cooperative electric utility, national park service (NPS), Environmental Protection Agency (EPA) and Department of Defense (DOD) Study, (SCENES) consortium of industrial and government agencies. As part of SCENES, a short term special study, the winter haze intensive tracer experiment (WHITEX) was specially formulated to asses the feasibility of various receptor modeling techniques to attribute emissions from the Navajo Generating Station to aerosol concentrations in three National Park Service sites, Canyonlands and Grand Canyon National Parks and Glen Canyon National Recreation Area, to relate aerosol concentrations to atmospheric extinction and finally to relate extinction to visibility impairment.This paper focuses on a subset of WHITEX, the source of visibility reducing aerosols at Page (Lake Powell), Arizona.

29035 Evaluation of radon reduction techniques in fourteen basement houses: Preliminary results. Volume 6. Turk, B.H. (Lawrence Berkeley Lab., Berkeley, CA (US)); Sextro, R.G.; Harrison, J.; Hubbard, L.M.; Gadsby, K.J.; Matthews, T.G.; Dudney, C.S. 23p. Air Pollution Control Assoc., Pittsburgh, PA (USA) (1988). (CONF-880679–: 81. annual meeting of Air Pollution Control Association, Dallas, TX (USA), 19-24 Jun 1988).

Technical Paper 88-107.2.

This paper reports the preliminary results of a study of radon control techniques in 14 homes in New Jersey. The study is part of a project initiated to: investigate the fundamentals of soil gas flow and radon entry into buildings and the factors that influence the entry rate; develop a diagnostic procedure for specifying appropriate and effective remedial measures; and better understand the operation of certain mitigation techniques and the parameters that affect them. Reported is a description of the radon control work that was conducted in the houses and a summary of the results of that work.

29036 Population exposure from natural sources and consumer products. Alpen, E.L. (Univ. of California, Berkeley (USA)). pp. 355 of Population exposure from the nuclear fuel cycle. Proceeding. Alpen, E.L.; Chester, R.O.; Fisher, D.R. Gordon and Breach Science Publishers S.A., New York, NY (US) (1988). (CONF-8709104–: ANS/ORNL topical conference on population exposure from the nuclear fuel cycle, Oak Ridge, TN (USA), 14-18 Sep 1987).

To set the background for a meaningful discussion of population exposure from the nuclear fuel cycle, it is necessary to examine

the competing contributors to radiation exposure for the human population. There is extensive documentation in various sources of the elements which make up the exposure of human beings to naturally occurring radiation. However, there are 3 draft documents of the National Council for Radiation Protection and Measurements which are soon to be published, and which cover, in detail, the three important aspects of this question. The three reports are those of Scientific Committee 43, Exposure to the Population in the US and Canada from natural Background; Scientific Committee 28; Radiation Exposure from Consumer Products and Miscellaneous Sources; and Scientific Committee 44, Exposure of the US Population to Diagnostic Medical Radiation. It is the purpose of this contribution to review and highlight the contacts of these documents. The dose from the first two of these sources is highly dependent upon location and other factors, but the general range of doses from natural radiation sources in the US is about 70-110 mrem/y. (0.7-1.10 mSv/y). Within recent years there has been a sharp increase in public awareness of the importance of the contribution of naturally occurring radon to exposure. Background radiation is well understood by the audience of this conference, therefore emphasis will be placed on the newer contributions relative to Quality Factor. There will be some discussion of the role of consumer products and technological enhancement of the natural contribution, as well as on the medical diagnostic exposure, which typically in advanced countries will range from 100-150 mrem/y (1.0-1.5 mSy/y). Exposure from technological enhancement and from consumer products contributes less than 10% to the total, but both are the result of human activity, and should be well understood and controlled.

29037 Current status of the NAVSEA backscatter absorption gas imaging (BAGI) development project. Kulp, T.J. (Environmental Sciences Div., Lawrence Livermore National Lab., Livermore, CA (USA)); Kennedy, R.; Garvis, D.; McRae, T. G.; Stahovec, J. pp. 307 of Laser applications in meteorology and earth and atmospheric remote sensing. Sokoloski, M.M. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1989). (CONF-8901157–: Laser applications in meteorology and earth and atmospheric remote sensing, Los Angeles, CA (USA), 16-18 Jan 1989).

Backscatter absorption gas imaging (BAGI) is a new technique that makes gas clouds and their surroundings visible in a real-time video image. It is superior to conventional sensors in characterizing the spatial properties of gas clouds because it provides data that are inherently two-dimensional. Less measuremental precision is required by the BAGI technique because it conveys information as contrasts between different areas in an image rather than as absolute concentration values. Furthermore, the pictorial display of this information allows it to be rapidly assimilated by emergency-response teams. The size and orientation of the plume are evident through comparison with familiar objects that also appear in the image. Subtler evaluations can be made as well, such as the distinction between innocuous and hazardous sources of the target gas. The BAGI development project is discussed in this paper. It has resulted in the creation of an instrument that is capable of imaging gases at ranges up to 30 m.

29038 Source attribution for hydrocarbons and ozone. Kleinman, L. (Brookhaven National Lab., Upton, NY (USA)); Benkovitz, C. pp. 736 of The scientific and technical issues facing post-1987 ozone control strategies. Wolff, G.T.; Hanisch, J.L.; Schere, K. Adam Hilger Ltd., Accord, MA (USA) (1988). (CONF-8711167–: APCA international specialty conference on the scientific and technical issues facing post-1987 ozone control strategies, Hartford, CT (USA), 16-19 Nov 1987).

Regional scale hydrocarbon and ozone concentrations have been calculated using a trajectory model with a linear description of hydrocarbon oxidation. The results and the model are discussed in this paper. Emitted hydrocarbons are assumed to react under the influence of an externally specified chemical environment. Emitted compounds are oxidized forming peroxy radicals which can oxidize NO, combine to form peroxides, or form adducts such as PAN. Secondary compounds can react further until complete oxidation occurs. Formation of 0_3 is associated with NO to NO_2 conversions. The linearity of the governing equations allows calculated hydrocarbon and 0_3 concentrations to be attributed to specific source regions, precursor compounds, or industrial categories. Anthropogenic and biogenic emission inventories for the contiguous U.S. are used to calculate 0_3 and hydrocarbon concentrations for a summer month.

29039 Interpretation of cloud-climate feedback as produced by 14 atmospheric general circulation models. Cess, R.D. (State Univ. of New York, Stony Brook (USA)); Potter, G.L.; Ghan, S.J.; Taylor, K.E.; Blanchet, J.P.; Boer, G.J.; Kiehl, J.T.; Slingo, A.; Washington, W.M.; Le Treut, H. *Science (Washington, D.C.) (USA)*, 245(4917): 513-516 (4 Aug 1989). DOE Contract W-7405-ENG-48.

Understanding the cause of differences among general circulation model projections of carbon dioxide-induced climatic change is a necessary step toward improving the models. An intercomparison of 14 atmospheric general circulation models, for which sea surface temperature perturbations were used as a surrogate climate change, showed that there was a roughly threefold variation in global climate sensitivity. Most of this variation is attributable to differences in the models depictions of cloud-climate feedback, a result that emphasizes the need for improvements in the treatment of clouds in these models if they are ultimately to be used as climatic predictors. 14 refs., 1 fig., 2 tabs.

29040 Organic nitrates in remote marine environments: Evidence for long range transport. Atherton, C.S. (Lawrence Livermore National Laboratory, Livermore, CA (US)). *Geophysical Research Letters (American Geophysical Union) (USA)*, 16(11): 1289-1292 (Nov 1989).

This paper examines both in-situ production and long-range transport of urban air as sources of marine alkyl nitrates. It is shown that alkyl nitrates are produced fairly rapidly in urban settings and persist for long times. The transport from urban areas can lead to alkyl nitrate concentrates of 4–83 pptv after 120–240 hours. These levels are far higher than those possible from marine in-situ production. Additionally, alkyl nitrates may be more abundant then PAN in remote marine environments. © American Geophysical Union 1989

29041 (CEAC-R–4-89) **Determination of water content in natural zeolites by reflection method.** Sarria, Lopez P. (Instituto Superior de Ciencia y Tecnologia Nuclear, La Habana (Cuba)); Desdin Garcia, V.; Freixas Lemus, V.; Dominguez Ley, O.; Csikai, G. Comision de Energia Atomica, La Habana (Cuba). 1989. 6p. Order Number DE90624445. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Water content in natural zeolites collected from different site places in Cuba has been determined by neutron reflection method. Results show that it is possible to separate the minerals abundant in zeolite from the surrounding barren rocks. Water content of about 10% can be determined with 2-3% relative accuracy for different matrices, using 10 m measuring time.

29042 (CEGB-RD/B–6167/R89) **Results of a monitoring programme in the environs of Berkeley aimed at collecting Chernobyl data for foodchain model validation.** Nair, S.; Darley, P.J.; Shaer, J. Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs. Mar 1989. 28p. Order Number DE90624681. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The results of a fallout measurement programme which was carried out in the environs of Berkeley Nuclear Laboratory in the United Kingdom following the Chernobyl reactor accident in April 1986 are presented in this report. The programme was aimed at establishing a time-dependent data base of concentrations of Chernobyl fallout radionuclides in selected agricultural products. Results

were obtained for milk, grass, silage, soil and wheat over an eighteen month period from May 1986. It is intended to use the data to validate the CEGB's dynamic foodchain model, which is incorporated in the FOODWEB module of the NECTAR environmental code. (author).

29043 (CEGB-RD/B–6201/R89) **The environmental behaviour of Chernobyl deposition in a high fallout region of Sweden: analysis of the results of a soil measurement programme.** Shaer, J.; Nair, S. Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs. Apr 1989. 28p. Order Number DE90624682. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Sweden received a particularly high level of fallout from the reactor accident at Chernobyl in April 1986. An environmental monitoring programme was initiated jointly by the CEGB and Studsvik to study the behaviour of the deposited radionuclides in the rural and urban environment of Gaevle where the highest depositions were recorded. This report is concerned with the analysis of the rural data collected over the period from August 1987 to August 1988. The aim has been to develop an improved model to predict the migration of radionuclides through pasture soil. Two alternative models were developed; the first a compartment model and the second a diffusion-advection model modified to account for fixation. The predictions of the two models were tested against the results of the monitoring programme. Least squares analyses were used to establish the better of the two models and to obtain estimates of the model parameters. In all but one case, the diffusion model was found to provide the better description of the behaviour of radionuclides; the effect of advection was found to be negligible. It is intended that this model will be incorporated into an improved model to predict the uptake of activity into animal products. (author).

29044 (EMO–1007) **USATHAMA [US Army Toxic and Hazardous Materials Agency] installation restoration program research and development strategies.** White, M.K.; Fow, C.L. Pacific Northwest Lab., Richland, WA (USA). Environmental Management Operations. Mar 1990. 112p. Sponsored by U.S. Department of Defense. DOE Contract AC06-76RL01830. (CETHA-TE-CR–90002). Order Number DE90009389. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This report is the result of a study conducted for the US Army Toxic and Hazardous Materials Agency to identify and prioritize potential research and development (R&D) activities that could reduce the cost of environmental restoration activities at Army installations where munitions production or tactical vehicle maintenance has been performed. In particular, the study examined potential R&D investments for restoration of soil and groundwater contaminated with explosives, heavy metals, and volatile organic compounds. Numerous new and innovative technologies that represent broad technology categories were considered in evaluating potential R&D investments for these restorations, and priorities for R&D investment were assigned to these technology categories. 23 refs., 16 figs., 30 tabs.

29045 (GRS–75) **Compilation of transfer factors and ecological parameters for calculation of radionuclide transport through food chains.** Biesold, H.; Handge, P. Gesellschaft fuer Reaktorsicherheit mbH (GRS), Garching (Germany, F.R.). Dec 1989. 59p. (In German). Order Number DE90773669. Available from NTIS (US Sales Only), PC A04/MF A01.

In connection with establishing the administrative guidelines 'Allgemeine Verwaltungsvorschrift zu Paragraph 45 Strahlenschutzverordnung (StrlSchV)' to be used, within the framework of the licensing procedure in the German Federal Republic for assessing exposure due to releases of radioactive materials from nuclear facilities and installations, transfer factors for soil/plant, feed/milk, and feed/meat will be summarized here as well as ecological parameters of the radioecological model appearing in the guidelines. Individual results of national and international scientific studies as well as presentations in summary were taken into account. Thereby, in particular, results of recent investigations through 1988 inclusively, and partially till 1989 were evaluated. For ecological parameters such as yield, growth time, storage time, and the crops' water and carbon content, national statistics and handbooks of agricultural practise were used. (orig.).

29046 (Juel-Spez–545) **Methods and models on soil conservation for the estimation of burdenings and for risk assessment of pollution. Status and demand on research.** Kneib, W.D.; Runge, I. Kernforschungsanlage Juelich GmbH (Germany, F.R.). Projektleitung Biologie, Oekologie, Energie (PBE); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Dec 1989. 570p. (In German). Contract BMFT 0339186A. Order Number DE90780411. Available from NTIS (US Sales Only), PC A24/MF A01.

There are only few userfriendly applicable models to be found and even less which are able to meet the demands of a burdening and risk assessment. From the point of view of soil science many of the methods and models find a satisfactory way to treat the vertical asepct, the lateral aspect is frequently neglected though. The collected literature shows a decreasing number of models taking into account groundwater > soil solution > plant > adjacent soils. A possible way to meet all the demands of a risk assessment could be constituted by a combination of the stochastic formulation of soil data to reveal uniform areas (or standardized differences), followed by a model quantifying relative sensitivities of each area as defined within the stochastic part. All possible ways through the soil should be taken into account and the antagonistic aspects of efflux and contamination should reproducibly be represented. (orig./EF).

29047 (NAGRA-NTB–89-24) **Stripa project annual report 1988.** Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland). May 1989. 127p. Available from Nagra, CH-5401 Baden, Switzerland.

The Stripa Project is an international project being performed under the sponsorship of the OECD Nuclear Energy Agency (NEA). The project concerns research related to the disposal of highly radioactive waste in crystalline rock. The Research and Development Division of the Swedish Nuclear Fuel and Waste Management Company (SKB) has been entrusted with the management of the project, under the direction of representatives from each participating country. The aim of this report is to inform the OECD Nuclear Energy Agency and the participants in the project about the general progress of work during 1988. (author) 36 figs., 5 tabs., 164 refs.

29048 (ORNL/FTR–3596) **[Preliminary work on the environmental impact statement for the US Antarctic Program]: Foreign trip report, March 17–April 11, 1990.** Railsback, S.F. Oak Ridge National Lab., TN (USA). 27 Apr 1990. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90009986. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Oak Ridge National Laboratory is preparing an environmental impact statement for the US Antarctic Program (USAP), which is operated for the National Science Foundation. This trip was a site visit to two USAP facilities: the R/V Polar Duke and Palmer Station. The Polar Duke is a 219-foot ice-strengthened vessel used as a research platform and for transportation. Palmer Station is a research base on Anvers Island near the Antarctic Peninsula. Environmental impacts include air emissions from diesel engines, discharges of untreated wastewater, the potential for spills of fuel and hazardous chemicals, and the attraction of tourists to the Palmer vicinity. Recommendations for minimizing impacts will be made in the environmental impact statement.

29049 (ORNL/TM–11470) **Colonization, road development and deforestation in the Brazilian Amazon Basin of Rondonia.** Frohn, R.C. (Oak Ridge National Lab., TN (USA)); Dale, V.H.; Jimenez, B.D. Oak Ridge National Lab., TN (USA). Mar 1990. 87p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90007968. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Environmental Sciences Division Publication No. 3394.

Within the past two decades, the forests of Brazil have undergone widespread and large scale clearing. The clearing of tropical rainforests may have serious global and local consequences. Global effects include a decrease in biodiversity with the elimination of plant and animal species; increases in atmospheric carbon dioxide, which may affect climate; and disruption of hydrological

regimes. Local effects include soil erosion, siltation, decreases in soil fertility, loss of plant cover and extractive resources, and disruption of indigenous populations. Nowhere in the Brazilian Amazon has deforestation increased at a faster rate than in the state of Rondonia. Deforestation in Rondonia has grown at increasing rates during the past decade mainly because of official colonization schemes, road construction, and the subsequent settlement of farmers. This paper contains a historical summary of colonization and road construction in the Amazon Basin of Brazil relative to deforestation in Rondonia. 60 refs., 11 figs., 14 tabs.

29050 (PB–90-156225/XAB) **Technologies of delivery or recovery for the remediation of hazardous-waste sites.** Murdoch, L.; Patterson, B.; Losonsky, G.; Harrar, W. Cincinnati Univ., OH (USA). Dept. of Civil and Environmental Engineering. Jan 1990. 105p. Available from NTIS, PC A06/MF A01.

Techniques to recover contaminants or deliver treating material at contaminated sites are described in the report. Few of the 17 described delivery or recovery techniques are in use today. New technologies, used in other industries such as petroleum extraction or mining, show promise for remediation of contaminated sites, but require investigation to affirmation of their suitability for in-situ remediation. The following 17 technologies are described: Colloidal gas aphrons; Hydraulic fracturing; Radial drilling; Ultrasonic methods; Kerfing; Electro-kinetics; Jet slurrying; CO2 injection; Polymer injection; Vapor extraction; Steam stripping; Hot brine injection; In-situ combustion; Radio frequency heating; Cyclic pumping; Soil flushing; Ground freezing. Each description of a technology includes an explanation of the basic processes involved, the optimal site conditions for use, the current status of research, the personnel currently involved in research, and a list of references.

29051 (PB–90-162777/XAB) **Superfund Record of Decision (EPA Region 5): Rose Township Cemetery Dump Site, Oakland County, Michigan. (Second remedial action), September 1989. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Sep 1989. 28p. (EPA/ROD/R–05-89/110). Available from NTIS, PC A03/MF A01.

See also PB–89-133949.

The 4-acre Cemetery Dump site is a former sand and gravel pit in Rose Township, Oakland County, Michigan. During the late 1960s or early 1970s, approximately 300 to 600 drums, containing paint sludges, solvents, PCBs, and oils, were illegally dumped and buried onsite. A 1985 Record of Decision (ROD) addressed the soil cleanup which included excavation and offsite disposal of visually-contaminated soil and drum fragments. Soil which was not visually contaminated was sampled and backfilled with clean soil into the excavated areas. Subsequent soil and ground water sampling indicated that zinc contaminants in the ground water exceed the Federal secondary MCL, a nonenforceable standard based on taste and odor, not protection of health. Zinc contamination, however, is most likely a result of monitoring well construction materials. No other contaminants exceed Federal or State environmental standards.

29052 (PNL–7270) **Interim reclamation report: Basalt Waste Isolation Project exploration shaft site.** Brandt, C.A.; Rickard, W.H. Jr.; Hefty, M.G. Pacific Northwest Lab., Richland, WA (USA). Feb 1990. 46p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC06-76RL01830. Order Number DE90009393. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

In 1968, a program was started to assess the feasibility of storing Hanford Site defense waste in deep caverns constructed in basalt. This program was expanded in 1976 to include investigations of the Hanford Site as a potential location for a mined commercial nuclear waste repository. Extensive studies of the geotechnical aspects of the site were undertaken, including preparations for drilling a large diameter Exploratory Shaft. This report describes the development of the reclamation program for the Exploratory Shaft Facility, its implementation, and preliminary estimates of its success. The goal of the reclamation program is to return sites disturbed by the repository program as nearly as practicable to their original conditions using native plant species. 43 refs., 19 figs., 9 tabs.

29053 (PNL–7291) **Uncertainty in North America wet deposition isopleth maps: Effect of site selection and valid sample criteria.** Simpson, J.C.; Olsen, A.R. Pacific Northwest Lab., Richland, WA (USA). Apr 1990. 78p. Sponsored by Environmental Protection Agency. DOE Contract AC06-76RL01830. Order Number DE90008205. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This report considers several issues related to the preparation of isopleth maps for the display of spatial patterns of wet deposition. The valid sample criteria and data completeness rating used in the data summarization process are described. The data interpolation technique, kriging, is presented and it's derivation in terms of generalized least squares regression is given. Four different annual summaries for pH, sulfate concentration, and sulfate deposition in 1986 are prepared using either the Unified Deposition Database Committee (UDDC) definition of valid sample criteria or a relaxed valid sample criteria and the UDDC data completeness rating or a relaxed data completeness rating. The kriged estimates for the different annual summaries and the differences between these estimates are contoured. The effects of relaxing the valid sample criteria and data completeness rating are discussed. Conclusions are drawn about network operation, network design and the uncertainty of contour maps. It is recommended that in the case where the objective is contour maps to show regional patterns, the emphasis in most regions needs to be on the number of valid samples per site and the regional representativeness of the sites. 4 refs., 14 figs., 7 tabs.

29054 **In situ treatment for contaminated soils.** Fitzpatrick, V.F. (Battelle Pacific Northwest Lab., Richland, WA (USA)). pp. 60 of Proceedings of the 1987 Pacific Northwest metals and minerals conference (abstracts): Modern mineral and metal technology. Albany Research Center, Albany, OR (USA) (1987). (CONF-8704166–: Pacific Northwest metals and minerals conference, Portland, OR (USA), 26-28 Apr 1987).

The author reports the development of a thermo-electric process for in situ treatment of contaminated soils. This process, known as in situ Vitrification (ISV), uses electrodes placed around the contaminated soil volume. This volume is then melted using the principle of joule heating. After colling, the resulting product is a vitrified mass resembling natural obsidian. Off-gases, resulting from the melting process, are contained in a hood placed over the processing area. These gases are routed to an off-gas treatment system. The process equipment is mounted in semi-trailers to facilitate transport. To minimize secondary waste, the scrub solution is recirculated. The process is independent of site services, except for electrical energy.

29055 **A comparison of environmental radionuclide concentrations calculated by a mathematical model with measured concentrations.** Jaquish, R.E. (Pacific Northwest Lab., Richland, WA (USA)); Napier, B.A. pp. 355 of Population exposure from the nuclear fuel cycle. Proceeding. Alpen, E.L.; Chester, R.O.; Fisher, D.R. Gordon and Breach Science Publishers S.A., New York, NY (US) (1988). DOE Contract AC06-76RL01830. (CONF-8709104–: ANS/ORNL topical conference on population exposure from the nuclear fuel cycle, Oak Ridge, TN (USA), 14-18 Sep 1987).

The Pacific Northwest Laboratory (PNL) conducts an extensive environmental monitoring program at the Hanford Site to determine radioactivity in the environment attributable to Hanford operations and to determine the resulting dose to the population. Monitoring involves the collection and analysis of environmental media including air particulates, water, soil, food crops, wildlife and vegetation. Because the environmental concentrations are so low and in most cases indistinguishable from previously deposited fallout radionuclides, the population doses are calculated using computer dose codes. The model used to calculate accumulated radiation doses from chronic ingestion of food products is incorporated in the PABLM computer code. This code estimates the transfer of radionuclides from air and irrigation water to plants and calculates the resulting concentration of radionuclides in food products. In this study, the concentrations of ^{90}Sr as calculated by PABLM were compared with measured concentrations obtained through the environmental monitoring program to determine how well the computer code predicts the environmental concentrations.

29056 Council for Health and Environmental Safety of Soils (CHESS): A coalition to standardize approaches to soil contamination problems. Kostecki, P.T.; Calabrese, E.J. pp. 515 of Petroleum contaminated soils. Volume 2. Calabrese, E.J.; Kostecki, P.T. Lewis Publishers, Chelsea, MI (USA) (1989). (CONF-8809413–: 3. national conference on the environmental and public health effects of soils contaminated with petroleum products, Amherst, MA (USA), 19-21 Sep 1988).

The organizational structure of the Council for Health and Environmental Safety (CHESS) is described in this paper. It is designed to permit peer review of relevant documents at two sequential levels. The first level of review for technical committee reports will be by the Council. A second level of review, which will incorporate not only scientific evaluation but also relevance to federal and state agencies, will be conducted by the Governing Board. In addition, both the Governing Board and Council have at their disposal the option to obtain external review from independent experts.

29057 2,3,7,8-tetrachlorodibenzo-p-dioxin: Aspects of its important properties and its potential biodegradation in soils. Arthur, M.F. (Battelle Columbus Div., OH (USA)); Frea, J.I. *Journal of Environmental Quality (USA),* 18(1): 1-11 (Jan-Mar 1989).

2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) is a persistent xenobiotic compound that has become widely dispersed in the environment. In laboratory animals, TCDD is acutely and chronically toxic, and is a carcinogen, mutagen, and teratogen. In humans, epidemiological studies of residents from Times Beach, MO, and Seveso, Italy, have failed to document significant TCDD-induced health effects. The environmental persistence of TCDD is due in part to its resistance to microbial attack. The factors responsible for microbial recalcitrance of pesticides are reviewed and related to the recalcitrance of TCDD. It is suggested that a major factor limiting TCDD degradation in the environment is its unavailability to the indigenous microflora. The possibility to decontaminate soils by mobilizing TCDD for attack by soil microorganisms is discussed.

29058 A geochemical assessment of terrestrial gamma-ray absorbed dose rates. Wollenberg, H.A. (Lawrence Berkeley Laboratory, CA (USA)); Smith, A.R. *Health Physics (USA),* 58(2): 183-189 (Feb 1990).

A survey of the geochemical literature and unpublished data has resulted in the classification of the concentrations of the naturally occurring radioelements U, Th, and K by their associated rock types. A data base of over 2500 entries has been compiled, permitting calculation of terrestrial gamma-ray absorbed dose rates. The general lithology of terrains may be distinguished by their radioelement ratios, relative abundances, and total gamma radioactivities. The gamma-ray absorbed dose rates in air above igneous rocks generally vary with their silica contents, and with the exception of shale, sedimentary rocks have lower K:U and K:Th ratios than most igneous rocks. The appreciable difference between the overall mean terrestrial gamma-ray dose rate for rock of the continental surface (approximately 7 X 10(-8) Gy h-1) and the mean dose rate from field measurements over soil (approximately 5 X 10(-8) Gy h-1) is explained by the substantial differences between radioelement concentrations of soil and rock, differences that may vary markedly with rock type.17 references.

29059 Microwave processing of radioactive materials - I. White, T.L. (Oak Ridge National Lab., TN (USA)); Berry, J.B. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA),* 29(1): 127-134 (1989). DOE Contract AC05-84OR21400. (CONF-8904177–: Symposium on innovative waste management technologies, Dallas, TX (USA), 9-14 Apr 1989).

This report reviews the applications of microwave energy for processing radioactive materials with particular emphasis on processing radioactive wastes. The focus will be on the two FCC-approved microwave frequencies for industrial, scientific, and medical use, 915 and 2450 MHz. Five advantages of microwave heating over conventional heating is presented. Special design issues unique to microwave plants are discussed. Four applications of microwave power to processing of radioactive materials is presented.

29060 Patterns of leaf and flower removal: Their effect on fruit growth in Chamaenerion angustifolium (fireweed). Shea, M.M. (Indiana Univ., Bloomington (USA)); Watson, M.A. *American Journal of Botany (USA),* 76(6): 884-890 (Jun 1989). DOE Contract AC09-76SR00819.

The response of Chamaenerion angustifolium (fireweed) plants of different patterns of artificial leaf and flower herbivory was examined to determine if the effects of localized herbivory were confined within vertical sectors of the plant. The effect of leaf and flower removal on fruit development was compared for removals within sectors and distributed among sectors. Fruit development did not differ in plants subjected to different patterns of leaf and flower removal. These results suggest that in disturbed plants carbohydrate movement is not confined within vertical sectors.

29061 Macroecology: The division of food and space among species on continents. Brown, J.H. (Univ. of New Mexico, Albuquerque (USA)); Maurer, B.A. *Science (Washington, D.C.) (USA),* 243(4895): 1145-1150 (3 Mar 1989).

Analyses of statistical distributions of body mass, population density, and size and shape of geographic range offer insights into the empirical patterns and causal mechanisms that characterize the allocation of food and space among the diverse species in continental biotas. These analyses also provide evidence of the processes that couple ecological phenomena that occur on disparate spatial and temporal scales - from the activities of individual organisms within local populations to the dynamics of continent-wide speciation, colonization, and extinction events. 26 refs., 6 figs.

29062 Temperature, water availability, and nutrient levels at various soil depths-consequences for shallow-rooted desert succulents, including nurse plant effects. Nobel, P.S. (Univ. of California, Los Angeles (USA)). *American Journal of Botany (USA),* 76(10): 1486-1492 (Oct 1989).

Soil conditions were evaluated over the rooting depths for Agave deserti and Ferocactus acanthodes from the northwestern Sonoran Desert. These succulents have mean root depths of only 10 cm when adults and even shallower distribution when seedlings, which often occur is association with the nurse plant Hilaria rigida, which also has shallow roots. Maximum soil temperatures in the 2 cm beneath bare ground were predicted to exceed 65 C, which is lethal to the roots of A. deserti and F. acanthodes, whereas H. rigida reduced the maximum surface temperatures by over 10 C, providing a microhabitat suitable for seedling establishment. Water Availability was defined as the soil-to-plant drop in water potential, for periods when the plants could take up water, integrated over time. Below 4 cm under bare ground, simulated Water Availability increased slightly with depth (to 35 cm) for a wet year, was fairly constant for an average year, and decreased for a dry year, indicating that the shallow rooting habit is more advantageous in drier years. Water uptake by H. rigida substantially reduced Water Availability for seedlings associated with this nurse plant. On the other hand, a 66-90% higher soil nitrogen level occurred under H. rigida, possibly representing its harvesting of this macronutrient from a wide ground area. Phosphorus was slightly less abundant in the soil under H. rigida compared with under bare ground, the potassium level was substantially higher, and the sodium level was substantially lower. All four elements varied greatly with depth, N and K decreasing and P and Na increasing. Based on the known growth responses of A. deserti and F. acanthodes to these four elements, growth was predicted to be higher for plants in soil from the shallower layers, most of the differences being due to nitrogen.

29063 (AD-A–216501/7/XAB) **Measuring the effectiveness of nonpoint-source control techniques for aquatic protection. Final summary report.** Gadbois, L.E. Naval Ocean Systems Center, San Diego, CA (USA). Nov 1989. 15p. (NOSC/TD–1682). Available from NTIS, PC A03/MF A01.

Documenting the effectiveness of nonpoint source (NPS) pollution control technologies requires a technique- and a site-specific monitoring program. This report details an evaluation method developed to determine which NPS control technique should be used, and how to evaluate the control's effectiveness. Attention to nonpoint source pollution (NPSP) originating from stormwater runoff is growing as point sources are eliminated or controlled. NPSP has largely escaped regulation because of frequent difficulty in identifying a culpable source and quantifying its environmental impact, as well as from little knowledge of effective control techniques. The lack of corporate knowledge of NPSP control techniques results from limited historical regulation and from poorly developed methods to measure the techniques' effectiveness. The refinement of a single or small set of control techniques will not be appropriate for all NPSP due to the diversity of pollutants in runoff. Several measures of effectiveness may be needed for each technique due to site-specific variations.

29064 (AD-A-216502/5/XAB) **Evaluation of four well-casing materials for monitoring selected trace-level organics in ground water.** Cold Regions Research and Engineering Lab., Hanover, NH (USA). Oct 1988. 37p. Available from NTIS, PC A03/MF A01.

In this study we examined four well casing materials, polyvinyl chloride (PVC), teflon, stainless steel 304 (SS 304) and stainless steel 316 (SS 316), to determine their suitability for monitoring selected trace level organic constituents in ground water. Analyte solutions containing pieces of the different well casings were compared to controls that did not contain well casing material. The aqueous test solution contained approximately 2 mg/l of each of the following organic substances: hexahydro-1,3,5-triazine (RDX), trinitrobenzene (TNB), cis- and trans-1,2-dichlorobenzene(CDCE and TDCE), m-Nitrotoluene(MNT), trichloroethylene(TCE), chlorobenzene(CLB), and o-, p-, and m-dichlorobenzene(ODCB, PDCB, and MDCB). Mercuric chloride was added to prevent biodegradation of the analytes. The two sets of isomers for DCE and DCB were selected to examine the effect of structure on sorption. Samples were taken after 0 hour, 1 hour, 8 hours, 24 hours, 72 hours, 7 days (168 hours), and approximately 6 weeks (1000 hours). There was no loss of any analyte in the samples that contained either type of stainless steel casing, although both types of casing rusted. The greatest losses were seen in samples that contained teflon casings, especially for the chlorinated organics. Losses of PDCB and MDCB were the greatest, 16% and 18%, respectively, after only 8 hours. While losses were also observed for the samples containing PVC casing, the rate ofloss was much slower, and usually 24 hours or more elapsed before losses were significant (more than 5%). After the 1000-hour samples were taken, the casings were rinsed and placed in clean vials containing fresh water and left for three days to allow for desorption.

29065 (CONF-9004173-1) **DUVAS [derivative ultraviolet absorption spectrometry] fiberscope for in situ groundwater monitoring.** Haas, J.W. III; Gammage, R.B. Oak Ridge National Lab., TN (USA). [1990]. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From DOE real-time subsurface monitoring of groundwater workshop; Dallas, TX (USA); 17-18 Apr 1990. Order Number DE90009822. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper discusses the Department of Energy (DOE) Real-Time Subsurface Monitoring Workshop held in Dallas, Texas. The project objective is to develop a rapid and reliable method for measuring the spatial and temporal distribution of organic solvents and fuel contaminants in groundwater on the Oak Ridge Reservation. One strategy for meeting this need is development of in situ sensors which respond to specific contaminants or classes of contaminants. Because of its proven ability to detect compounds such as benzene and its derivatives, which are common solvents and components of fuels, derivative ultraviolet absorption spectrometry (DUVAS) is being developed for in situ detection of aromatic pollutants. A prototype DUVAS fiberscope has been constructed and tested for groundwater analysis. An important component of the fiberscope is a rugged, down-well prove with a unique "detector-in-head" design that increases the maximum depth of subsurface detection. Results comparable to those obtained with a conventional laboratory spectrometer have been achieved with optical fiber lengths up to 50 meters. 9 figs., 2 tabs.

29066 (DOE/BP/63406-3) **Climate change in the Pacific Northwest and its impact on energy planning: Preliminary report on findings: Final report.** Wade, J.E.; Wittrup, R.; Redmond, K.; Buckley, J. Oregon State Univ., Corvallis, OR (USA). Wind Resources Assessment Lab. Sep 1987. 79p. Sponsored by U.S. DOE Management & Administration. DOE Contract BI79-86BP63406. (BPA-87-26). Order Number DE90009462. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This report is a summary of the FY 87 research on energy related climatic variation. The report will discuss the findings, their implications and suggest profitable areas of research. Examination of climate variation is particularly timely consideration given the recent drought in the Pacific Northwest. This report describes a number of interesting trends, cyclic variations and inter-relationships that could be useful in energy planning. Topics include wind drought, recent snowpack variations, precipitation trends, temperature trends and future climate research. 37 refs., 51 figs., 3 tabs.

29067 (GKSS-89/E/32) **A study on the transport of pollutants through the Hamburg harbour.** Fanger, H.U. (GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany, F.R.). Inst. fuer Physik); Kolb, M.; Michaelis, W.; Mueller, A.; Schoenburg, M. GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany, F.R.). 1989. 8p. Available from GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany, F.R.).

In September 1986, a comprehensive measuring campaign in the Elbe bifurcation area of Hamburg was conducted by GKSS. Hydrographic measuring techniques including the moving boat method, sophisticated trace analytical procedures, and fluorescent dye (Rhodamine-B) tracer techniques were applied. Over more than six coherent tidal cycles, a consistent set of data on discharges of water, suspended matter, particulate and dissolved trace elements (heavy metals) has been obtained for cross-sections at the harbour entrance Oortkaten and the harbour exit Nienstedten. Transport and residence times of river water and its dissolved constituents (e.g. Ni, As, Sb) resulted from analysis of space/time dependent Rhodamine concentrations. From stratigraphic trace-analyses of Harburg harbour sediments, performed in an separate study on behalf of the Ministry of Environment, Hamburg, it has been concluded that the increase in heavy metal concentration started before the turn of the century. (orig.).

29068 (GKSS-89/E/38) **Investigations of the resuspension behaviour of estuarine suspended matter.** Noether, B. (GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany, F.R.). Inst. fuer Physik). GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany, F.R.); Fachhochschule Hamburg (Germany, F.R.). 1989. 97p. (In German). Order Number DE90780174. Available from NTIS (US Sales Only), PC A05/MF A01.

Laboratory experiments were carried out to examine the critical shear stress and the resuspension behaviour of freshly deposited estuarine suspended matter. The experimental parameters were the bed thickness, the time of deposition and the acceleration of flow velocity. Flocs of suspended matter were produced in a 5 m high settling tube by mild turbulence. During simulated slack water periods of 1 and 2 hours, the flocs were allowed to deposit and to form a bed. That bed was resuspended by a propeller in fixed shear stress intervals, simulating the increase of flow velocity after slack water. The same value of the critical shear stress was found for all experiments, independent of the experimental parameters. The only significant parameter for resuspension behaviour was the bed thickness. (orig.) With 27 figs., 21 tabs.

29069 (GKSS-89/E/48) **Modeling of the brackish water dynamics of the lower Elbe estuary.** Duwe, K. (GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany, F.R.). Inst. fuer Physik). GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany, F.R.); Hamburg Univ. (Germany, F.R.). Fachbereich Geowissenschaften.

1989. 194p. (In German). Order Number DE90780377. Available from NTIS (US Sales Only), PC A09/MF A01.

By means of three-dimensional baroclinic numerical models and detailed observational data specific dynamical processes of the brackish water zone of tidal estuaries are being investigated. The author looks especially at the Lower Elbe estuary where many measurements data and observations were at hand. The developed model formulations were used in high resolving, three-dimensional, baroclinic current models to investigate the current and mass field in the whole brackish water zone as well as in a special section of the wadden sea area around the tidal creek Neuenfelder Rinne. It is concluded that in questions of transport processes and their associated current fields the influence of the variable salinity is of considerable importance. (orig.) With 87 figs., 11 tabs.

29070 (ORNL–6602) **Environmental Sciences Division annual progress report for period ending September 30, 1989.** Oak Ridge National Lab., TN (USA). Apr 1990. 267p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90007969. Available from NTIS, PC A12/MF A01 - OSTI; GPO Dep.

Environmental Sciences Division Publication No. 3400.

This progress report summarizes the research and development activities conducted in the Environmental Sciences Division of Oak Ridge National Laboratory during the period October 1, 1988, through September 30, 1989. The report is structured to provide descriptions of current activities and accomplishments in each of the division's major organizational units. Following the sections describing the organizational units is a section devoted to lists of information necessary to convey the scope of the work in the division.

29071 (ORNL/TM–11368) **Groundwater parameters and flow systems near Oak Ridge National Laboratory.** Moore, G.K. (Tennessee Univ., Knoxville, TN (USA)). Oak Ridge National Lab., TN (USA). Sep 1989. 83p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90010210. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Environmental Sciences Division Publication No. 3403.

This report is intended to supplement a recent study that revised the concepts of groundwater occurrence and flow in the Oak Ridge National Laboratory (ORNL) area. Some new data have been acquired, but the present report, for the most part, consists of a further interpretation of previously available data. Several additional factors and processes that may affect the groundwater budget of the ORNL area are described. Also, some parameter values in the previous report were based on relatively few data; the present report used convergence of evidence to test these values. Finally, the additional interpretations in the present report revise some of the parameter values in the previous report. The purposes of the present report are to derive more accurate parameter values for future digital modeling and to better characterize the various groundwater flow systems. The resulting conceptual model should be applicable to other areas on the Oak Ridge Reservation and to many other areas underlain by consolidated rocks. 32 refs., 14 figs., 1 tab.

29072 (PB–90-150962/XAB) **Superfund Record of Decision (EPA Region 2): Ewan Property, NJ. (Second Remedial Action), September 1989. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Sep 1989. 121p. (EPA/ROD/R–02-89/095). Available from NTIS, PC A06/MF A01.

See also PB–89-196760.

The 43-acre Ewan Property site is in the New Jersey Pinelands in Shamong Township, Burlington County, New Jersey. Between 1974 and 1975 the site owner reportedly buried uncontained and drummed hazardous wastes in an onsite disposal area. In 1982 the county was informed of the possible hazardous waste dumping and initiated ground water monitoring and soil sampling programs the following year. Both the ground water and soil within the disposal area were found to be contaminated with VOCs and metals. The remedial action represents the second of two operable units for the site. The 1988 Record of Decision addressed the treatment of 4,500 cubic yards of source waste including buried drums and other heavily contaminated materials. The second operable unit addresses the remediation of the residual soil which will remain after implementation of the first operable unit and the treatment of the contaminated ground water. The primary contaminants of concern affecting the soil and ground water are VOCs including benzene, PCE, TCE, toluene, and xylenes; and metals including chromium and lead.

29073 (PB–90-153511/XAB) **Proximity of Pennsylvania sanitary landfills to wetlands and deepwater habitats: Statewide results.** Herndon, R.C.; Moerlins, J.E.; Lambou, V.W.; Gebhard, R.L. Florida State Dept. of Education, Tallahassee, FL (USA). Universities Div. Dec 1989. 33p. Available from NTIS, PC A03/MF A01.

Sanitary landfills can cause considerable harm to sensitive ecosystems if they are not properly located, designed, and managed. The purpose of the report is to document the proximity of sanitary landfills included in the study in Pennsylvania to wetlands and deepwater habitats (i.e., rivers, lakes, streams, bays, etc.). The sanitary landfills were identified on U.S. Fish and Wildlife Service's National Wetlands Inventory maps. The nearness or proximity of the sanitary landfills to wetlands and deepwater habitats was determined by drawing three concentric regions around the point representing the location of each landfill. The radii of the concentric regions were: 1/4 mile, 1/2 mile, and 1 mile. A companion report summarizes the statewide results. The data on individual landfills include: (1) general facility/site data, and (2) wetlands/deepwater habitat data.

29074 (PB–90-153701/XAB) **Superfund Record of Decision (EPA Region 2): Chemical Insecticide, Middlesex County, NJ. (First Remedial Action), September 1989.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Sep 1989. 81p. (EPA/ROD/R–02-89/098). Available from NTIS, PC A05/MF A01.

Portions of this document are not fully legible.

The Chemical Insecticide site is part of a 94-acre industrial development in Edison, Middlesex County, New Jersey. From 1958 to 1970 Chemical Insecticide Corporation (CIC) produced and stored pesticide formulations at the property resulting in soil, surface water, and ground water contamination. Between 1966 and 1969 CIC was ordered by the city to close onsite lagoons, dispose of leaking drums, and stop wastewater discharge. Subsequent RI/FS investigations revealed the extreme complexity of the site due to the number and variety of contaminants (herbicides, pesticides, and metals) and the physical characteristics of the site. The primary contaminants of concern in the soil which may affect the surface water are organics including pesticides, and metals including arsenic. The selected remedial action for this site includes clearing and grading the site; covering the entire site with an impermeable surficial cap; constructing a surface water runoff diversion system; controlling the release of collected, uncontaminated surface water runoff from the site; and surface water monitoring.

29075 (PB–90-153727/XAB) **Superfund Record of Decision (EPA Region 2): Port Washington Landfill, Nassau County, NY. (First Remedial Action), September 1989. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 30 Sep 1989. 137p. (EPA/ROD/R–02-89/082). Available from NTIS, PC A07/MF A01.

Portions of this document are not fully legible.

The Port Washington Landfill site is on the eastern portion of Manhasset Neck, Nassau County, Long Island, New York. The 139-acre municipally owned site consists of two landfilled areas separated by a vacant area. The Record of Decision addresses the 53-acre inactive landfill on the western portion of the site, which is the suspected source of methane gas thought to cause furnace explosions in residences neighboring the landfill during 1979 through 1981. From 1974 to 1983 the landfill operator accepted incinerator residue, residential and commercial refuse, and construction rubble for disposal. Because extensive air monitoring, performed in 1981, revealed high methane levels in several areas residences, a venting system was installed to prevent subsurface gases from migrating west of the landfill and to destroy hazardous chemicals commonly detected in sanitary landfill gas. The selected remedial action for the site includes capping the landfill; rehabilitating the

existing gas collection system and installing additional vacuum extraction vents; ground water pumping and treatment.

29076 (PB–90-153768/XAB) **Superfund Record of Decision (EPA Region 1): Kellogg-Deering Well Field, Norwalk, CT. (Second Remedial Action), September 1989.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Sep 1989. 128p. (EPA/ROD/R–01-89/039). Available from NTIS, PC A07/MF A01.

See also PB–87-189866.

The Kellogg-Deering Well Field site is a 10-acre contaminated municipal well field in Norwalk, Fairfield County, Connecticut, which includes adjacent source areas that contribute to the well field contamination. The city detected elevated TCE levels in the wells during routine monitoring in 1975 and subsequently shut down unacceptably contaminated wells until a redwood slat treatment system was installed in 1981. EPA conducted a remedial investigation between 1984 and 1986 leading to a 1986 Record of Decision (ROD) which required the city to operate an air stripping unit. EPA conducted a subsequent remedial investigation in 1987 which further defined the contaminated ground water area. The primary contaminants of concern affecting the soil and ground water are VOCs including benzene, PCE, TCE, toluene, and xylenes.

29077 (PB–90-155623/XAB) **Proximity of Connecticut sanitary landfills to wetlands and deepwater habitats: Statewide results.** Lambou, V.W.; Herndon, R.C.; Moerlins, J.E.; Gebhard, R.L. Florida State Univ., Tallahassee, FL (USA). Center for Biomedical and Toxicological Research and Hazardous Waste Management. Nov 1989. 33p. Available from NTIS, PC A03/MF A01.

See also PB–90-155631.

Sanitary landfills can cause considerable harm to sensitive ecosystems if they are not properly located, designed, and managed. The purpose of the reports are to summarize the proximity of sanitary landfills in Connecticut to wetlands and deepwater habitats (i.e., rivers, lakes, streams, bays, etc.) and present data on the individual landfills. The sanitary landfills were identified on U.S. Fish and Wildlife Service's National Wetlands Inventory maps. Most sanitary landfills in Connecticut are located in or are close to either wetlands or deepwater habitats. These facilities have the potential to adversely affect sensitive ecosystems, such as wetlands and deepwater habitats, either through habitat alterations or through the migration of contaminants from sanitary landfills.

29078 (PB–90-155631/XAB) **Proximity of Connecticut sanitary landfills to wetlands and deepwater habitats: Data on individual landfills.** Lambou, V.W.; Herndon, R.C.; Moerlins, J.E.; Bebhard, R.L. Florida State Univ., Tallahassee, FL (USA). Center for Biomedical and Toxicological Research and Hazardous Waste Management. Nov 1989. 29p. Available from NTIS, PC A03/MF A01.

See also PB–90-155623.

Sanitary landfills can cause considerable harm to sensitive ecosystems if they are not properly located, designed, and managed. The purpose of the report is to document the proximity of sanitary landfills included in the study in Connecticut to wetlands and deepwater habitats (i.e., rivers, lakes, streams, bays, etc.). The sanitary landfills were identified on U.S. Fish and Wildlife Service's National Wetlands Inventory maps. A companion report summarizes the statewide results. These facilities have the potential to adversely affect sensitive ecosystems, such as wetlands and deepwater habitats, either through habitat alterations or through the migration of contaminants from sanitary landfills.

29079 (PB–90-155649/XAB) **Proximity of New York sanitary landfills to wetlands and deepwater habitats: Statewide results.** Moerlins, J.E.; Herndon, R.C.; Lambou, V.W.; Gebhard, R.L. Florida State Univ., Tallahassee, FL (USA). Center for Biomedical and Toxicological Research and Hazardous Waste Management. Dec 1989. 33p. Available from NTIS, PC A03/MF A01.

See also PB–90-155656.

Sanitary landfills can cause considerable harm to sensitive ecosystems if they are not properly located, designed, and managed. The purpose of the reports are to summarize the proximity of sanitary landfills in New York to wetlands and deepwater habitats (i.e., rivers, lakes, streams, bays, etc.) and present data on the individual landfills. The sanitary landfills were identified on U.S. Fish and Wildlife Service's National Wetlands Inventory maps. The nearness or proximity of the sanitary landfills to wetlands and deepwater habitats was determined by drawing three concentric regions around the point representing the location of each landfill. These facilities have the potential to adversely affect sensitive ecosystems, such as wetlands and deepwater habitats, either through habitat alterations or through the migration of contaminants from sanitary landfills.

29080 (PB–90-155656/XAB) **Proximity of New York sanitary landfills to wetlands and deepwater habitats: Data on individual landfills.** Moerlins, J.E.; Herndon, R.C.; Lambou, V.W.; Gebhard, R.L. Florida State Univ., Tallahassee, FL (USA). Center for Biomedical and Toxicological Research and Hazardous Waste Management. Dec 1989. 59p. Available from NTIS, PC A04/MF A01.

See also PB–90-155649.

Sanitary landfills can cause considerable harm to sensitive ecosystems if they are not properly located, designed, and managed. The purpose of the report is to document the proximity of sanitary landfills included in the study in New York to wetlands and deepwater habitats (i.e., rivers, lakes, streams, bays, etc.). 29081 (PB–90-157504/XAB) **Assessment of episodic acidification in the Sierra Nevada, California. Final report, 1987-1989.** Schnoor, J.L.; Nikolaidis, N.P.; Nikolaidis, V.S. Department of Energy, Washington, DC (USA). Div. of Conservation Research and Technology. Aug 1989. 69p. Available from NTIS, PC A04/MF A01.

Researchers compiled data on 168 low-ANC lakes in the Sierra Nevada, California. They then formulated an Episodic Event Model (EEM) that was used to simulate lake ANC during snowmelt episodes. During snowmelt the surface water ANC is near zero due to dilution from snowmelt. During this period acidification can occur should acidic rain enter the watershed. Using the EEM to simulate a 20-day runoff event at snowmelt, the model results indicate that about 80% of the lakes considered would reach an ANC less than 40 micro eq/l. There are insufficient spatial or temporal data on the chemistry or amount of deposition to high-elevation areas in the Sierra. Also, the model assumes no interaction between the watershed and incoming deposition.

29082 (PB–90-159393/XAB) **Assessing the relationship between Section 404 and wetland losses: A feasibility study.** Roelle, J.E.; Asherin, D.A.; Gladwin, D.N. National Ecology Research Center, Fort Collins, CO (USA). Sep 1989. 25p. (BIOLOGICAL–89(21)). Available from NTIS, PC A03/MF A01.

Also available from Supt. of Docs.

The primary objective of the Clean Water Act of 1977 (33 U.S.C. 1251) is to restore and maintain the physical, chemical, and biological integrity of the Nation's waters. Section 404 of the Act regulates the discharge of dredged or fill materials into wetlands and represents the primary Federal authority for regulation of wetland alterations. Since its inception, the Section 404 program has been controversial in regard to the extent to which it was intended to provide wetlands regulation. The U.S. Army Corps of Engineers (Corps) issues Section 404 permits, which can be of two types. Individual Permits are issued following case-by-case reviews of proposed discharges. General Permits, which can be either nationwide or regional in scope are authorized by the Corps for categories of activities that are similar in nature and that have only minimal individual and cumulative adverse environmental impacts. At present, 26 categories of Nationwide Permits have been authorized by the Corps.

29083 (PB–90-159807/XAB) **Handbook of suggested practices for the design and installation of ground-water monitoring wells. Final report, June 1985-July 1989.** Aller, L.; Bennett, T.W.; Hackett, G.; Denne, J.E.; Petty, R.J. Environmental Protection Agency, Las Vegas, NV (USA). Environmental Monitoring Systems Lab. Feb 1990. 416p. (EPA–600/4-89/034). Available from NTIS, PC A18/MF A03.

The document is intended to assist personnel involved with the design, construction, and installation of ground-water monitoring wells. It does not focus on specific regulatory requirements, but instead presents state-of-the-art technology that may be applied in diverse hydrogeologic situations. The Handbook addresses field-oriented practices to solve monitoring well construction problems rather than conceptual or idealized practices. The information is presented in both matrix and text form. The matrices use a relative numerical rating scheme to guide the user toward appropriate drilling technologies for particular monitoring situations. The text provides the narrative overview of the criteria that influence groundwater monitoring well design and construction. Such influencing factors include purpose, location, site hydrogeology, contaminant characteristics, anthropogenic activities, and testing equipment.

29084 (PB–90-160722/XAB) **Chemical and toxicological analyses of Lake Calumet (Cook County, Illinois) sediments.** Ross, P.E.; Burnett, L.C.; Henebry, M.S. Illinois Inst. of Natural Resources, Champaign, IL (USA). Illinois Natural History Survey. Sep 1989. 79p. Available from NTIS, PC A05/MF A01.

Lake Calumet, located on Chicago's Far South Side, has been exposed to a wide range of industrial contaminants for approximately 110 years. Continued industrial activity and residues from past waste disposal practices, however, still threaten the Lake Calumet system. A study was initiated in 1986 by the Hazardous Waste Research and Information Center (HWRIC) of the Illinois Department of Energy and Natural Resources to Make a preliminary assessment of the physical, chemical, and biological processes that influence the environmental quality of Lake Calumet and the surrounding area and to predict the ecological effects of the contamination associated with lake sediments.

29085 (PB–90-160771/XAB) **Activity of PCBs (polychlorinated biphenyls) in sediments and water from Lake Calumet and Waukegan Harbor.** Murphy, T.J.; Galinis, D.L.; Arnold, C. DePaul Univ., Chicago, IL (USA). Dept. of Chemistry. Dec 1989. 55p. Available from NTIS, PC A04/MF A01.

Techniques were developed to measure the activity (fugacity; escaping tendency) of semi-volatile organic compounds, PCBs in this case, in water and sediment samples. The techniques were applied to samples from Lake Calumet and Waukegan Harbor. Knowing the activities of the PCBs in the samples permitted the following to be determined: (1) the thermodynamic sediment/water partition coefficient, Kd; (2) the direction of movement of compounds between the sediments and water; (3) the expected PCB concentrations in the water at equilibrium with the sediments; (4) the amount of PCBs evaporating per year from these bodies of water; and (5) an average partition coefficient for the PCBs present in each sediment sample, Kd.

29086 (PB–90-160961/XAB) **Effectiveness of the innovative and alternative waste-water-treatment technology program. Report to the Congress.** Environmental Protection Agency, Washington, DC (USA). Office of the Assistant Administrator for Water. Sep 1989. 170p. (EPA–430/09-89/009). Available from NTIS, PC A08/MF A01.

The Report to Congress, required by Section 517 of the Water Quality Act of 1987, Public Law No. 100-4, presents the results of an Environmental Protection Agency study of the effectiveness of the innovative and alternative (I/A) wastewater treatment technology program. The objectives of the study are to summarize information by State on the types of I/A wastewater treatment technologies and on the number of facilities constructed employing them, describe I/A technologies that have not performed to design standards, determine which States have not obligated the set-aside for I/A technologies and the reasons for failure to make such obligations, and recommend more effective incentives for using I/A wastewater treatment technologies.

29087 (PB–90-160995/XAB) **Multispectral identification and confirmation of organic compounds in waste-water extracts.** McGuire, J.M.; Collette, T.W.; Thurston, A.D.; Richardson, S.D.; Payne, W.D. Environmental Protection Agency, Athens, GA (USA). Environmental Research Lab. Feb 1990. 204p. (EPA–600/4-90/002). Available from NTIS, PC A10/MF A02.

Application of multispectral identification techniques to samples from industrial and POTW wastewaters revealed identities of 63 compounds that had not been identified by empirical matching of mass spectra with spectral libraries. Twenty-five of the compounds had not been found in wastewaters previously. Multispectral techniques used in the identifications were GC/MS (low resolution), high resolution mass spectrometry, positive methane chemical ionization mass spectrometry, and gas chromatography combined with Fourier transform infrared spectroscopy. Some of the same techniques were used to confirm (without obtaining a pure sample of the tentatively identified compound) identifications made by reexamination of GC/MS data tapes generated by contractor laboratories. Eighty percent of the identifications were confirmed. Some of the wrong identifications made by reexamination of the tapes were attributed to poor chromatography during the initial analysis.

29088 (PB–90-162231/XAB) **Evaluation of stream liming effects on water quality and spawning of migratory fishes in Maryland Coastal Plain streams. 1988 results. Final report.** Greening, H.S.; Janicki, A.J.; Klauda, R.J.; Baudler, D.M.; Levin, D.M. International Science and Technology, Inc., Sterling, VA (USA). Sep 1989. 244p. Available from NTIS, PC A11/MF A02.

See also PB–89-132294.

Calcite dosers were tested in 1988 on three Maryland Coastal Plain streams subject to acidic pulses during precipitation events. Increased flow during precipitation events resulted in depressed pH, ANC and Ca concentrations and elevated A1 levels in untreated sections of each study stream. Water quality in areas of each stream receiving calcite slurry was maintained near baseflow conditions. In situ survival tests were performed on yellow perch and blueback herring. Adult spawning surveys, ichthyoplankton collections, and juvenile surveys showed several migratory fish populations to be near historically low levels in four of the five streams sampled in 1988.

29089 (PB–90-162611/XAB) **Superfund Record of Decision (EPA Region 7): Chemplex, Clinton, IA. (First remedial action), September 1989.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 27 Sep 1989. 84p. (EPA/ROD/R–07-89/024). Available from NTIS, PC A05/MF A01.

The Chemplex site is in Clinton County within 5 miles of Clinton, Iowa, and includes a landfill, a waste water treatment plant, and an adjacent facility which manufactures high and low density polyethylene. From 1968 to 1978 the landfill area was used for disposal of various plant wastes including black oily sludge, scrap polyethylene, construction debris, and carbonate sludge. The debutanized aromatic concentrate (DAC) area, which consists of a pit and DAC product storage and loading areas, was contaminated by DAC spillage. In 1987, waste was reportedly removed from the pit and disposed of in a RCRA permitted landfill. Wastes and spills have contaminated the soil and ground water underneath the landfill and DAC areas. This first operable unit will address the plumes of ground water contamination. A subsequent operable unit remedy for the site will address the cleanup of soil and other ground water remediation that may be required. The primary contaminants of concern affecting the ground water are VOCs including benzene, toluene, xylenes, TCE, and PCE; and other organics including carcinogenic and noncarcinogenic PAHs.

29090 (PB–90-162645/XAB) **Superfund Record of Decision (EPA Region 7): Doepke Disposal (Holliday), KS. (First remedial action), September 1989. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 21 Sep 1989. 84p. (EPA/ROD/R–07-89/032). Available from NTIS, PC A05/MF A01.

The Doepke Disposal (Holliday) site is an inactive industrial-waste landfill located east of Holliday, Johnson County, Kansas. During the 1950s and early 1960s the site was used as a landfill for residential refuse. In 1963 Doepke Disposal Service, Inc.

leased the property and operated a commercial and industrial waste landfill until 1970, when the State shut down the operation. Materials such as fiberglass, fiberglass resins, paint sludges, spent solvents, metal sludges, soaps, and pesticides were reportedly disposed of at the landfill. In 1966 fire debris and up to 374 drums of solvents and organochlorine and organophosphate pesticides were disposed of at the site as a result of a fire at a Kansas City chemical plant. Initially wastes and residues brought to the site were burned, however, in the late 1960s burning operations ceased and solid wastes were buried onsite and liquids were disposed of in two surface impoundments. In 1977 rock material excavated during the construction of an interstate was dumped onsite and in some cases over the deposited waste. The current owner uses portions of the site for storage of clay, crushed shales, and crushed limestone. The primary contaminants of concern affecting the soil and ground water are VOCs including benzene, toluene, and xylene; other organics including PAHs, PCBs, and pesticides, and metals including chromium and lead.

29091 (PB–90-162678/XAB) **Superfund Record of Decision (EPA Region 3): Cryochem, Berks County, PA (First remedial action), September 1989.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Sep 1989. 89p. (EPA/ROD/R–03-89/078). Available from NTIS, PC A05/MF A01.

Portions of this document are not fully legible.

The 19-acre CryoChem facility is a metal fabricating facility in the village of Worman, Earl Township, Berks County, Pennsylvania. Between 1970 and 1982, Cryochem reportedly used chemical solvents to clean dye from metal welds at a rate of two to three 55-gallon drums per year. The facility also reported that a solvent spill had occurred at some unspecified time in the past. Spilled solvent is suspected to have collected in the workshop drains and flowed, through underground channels, towards a stream that flows across the site. Spilled solvent has also migrated through the soil column and has contaminated the ground water underlying the site. Ground water samples, collected between 1981 and 1985 by the State and EPA, revealed that an onsite production well, nearby residential wells, and onsite soil have been contaminated. As a result of drinking water contamination, EPA installed activated carbon filters in 13 homes in 1987. The primary contaminants of concern affecting the ground water are VOCs including TCA, DCA, TCE, DCE, and PCE.

29092 (PB–90-162785/XAB) **Superfund Record of Decision (EPA Region 5): Hedblum Industries, MI. (First remedial action), September 1989. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Sep 1989. 59p. (EPA/ROD/R–05-89/112). Available from NTIS, PC A04/MF A01.

Hedblum Industries site, an automotive parts manufacturing plant, is approximately one mile southwest of the town of Oscoda, in AuSable Township, Iosco County, Michigan. Ground water flows beneath the plant and subdivision and discharges via a bayou into the AuSable River. Between 1968 and 1972 the previous plant operators discharged cooling water, rinse water, and approximately 4,000 gallons of waste TCE onto the ground. In 1973 VOCs were detected in residential wells in the AuSable subdivision. Contaminated wells were replaced with deeper wells which by 1977 also showed traces of contamination. Subsequently, the Oscoda Township Municipal Supply System was extended to residents through the installation of a new water main. An underground storage tank containing TCE, TCA, and PCE was removed from the site in 1980. The primary contaminants of concern affecting the ground water are VOCs including benzene, toluene, xylenes, TCE, and PCE; and metals including lead. The selected remedial action for the site includes ground water pumping and treatment using activated carbon adsorption with discharge to the bayou; and ground water and soil monitoring. The estimated present worth cost of the remedial action is $2,379,000, which includes an annual O&M cost of $264,000 over 4-5 years.

29093 (PB–90-162801/XAB) **Superfund Record of Decision (EPA Region 1): South Municipal Water Supply Well, BH. (First remedial action), September 1989.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 27 Sep 1989. 129p. (EPA/ROD/R–01-89/044). Available from NTIS, PC A07/MF A01.

The 250-acre South Municipal Water Supply Well site is near the Town of Peterborough, in Hillsborough County, New Hampshire. Also on the site are the New Hampshire Ball Bearings Incorporated (NHBB) manufacturing facility, several commercial establishments, and several apartments. The town of Peterborough discontinued use of the South Well in May 1983 after the State discovered VOC contamination in water samples taken from the well. Subsequent investigations revealed that a plume of contaminated ground water extended from under the NHBB property to the vicinity of the South Well. VOC contamination was also detected in soil on the NHBB property, and wetlands sediment was found to be contaminated with PCBs, metals, and PAHs. Investigations attributed the contamination to in-house chemical releases that were subsequently washed out through floor drains or slop sinks to outfalls, or washed out through facility doors. Exterior releases contributed to contamination at the site through the draining of a truck-mounted waste solvent tank. The primary contaminants of concern affecting the soil and ground water are VOCs including PCE, TCE, and toluene; the primary contaminants of concern affecting the sediment are organics including PCBs and PAHs, and metals.

29094 (PB–90-162942/XAB) **Superfund Record of Decision (EPA Region 5): Alsco Anaconda, OH. (First remedial action), September 1989.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 8 Sep 1989. 54p. (EPA/ROD/R–05-89/102). Available from NTIS, PC A04/MF A01.

The Alsco Anaconda site is a 4.8-acre former sludge disposal area in Gnadenhutten, Tuscarawas County, Ohio. Contamination at the site occurred from 1965 to 1978 when wastewater and wastewater treatment sludge from the plant, containing hazardous aluminum processing wastes (FO19), was disposed of in an unlined settling basin and a sludge pit. In 1978 the plant owners began dewatering the treatment sludge prior to disposal of sludge offsite in the settling basin and a former swamp area. Because leachate from the sludge may have contaminated the ground water and surface water, a subsequent ROD will address the appropriate remedial action for those media. The primary contaminants of concern affecting the soil and sludge are organics including PCBs, and metals including chromium, cyanide, and arsenic.

29095 (PB–90-163544/XAB) **Superfund Record of Decision (EPA Region 1): W. R. Grace Acton, Massachusetts (First remedial action), September 1989.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Sep 1989. 211p. (EPA/ROD/R–01-89/040). Available from NTIS, PC A10/MF A02.

The W.R. Grace (Acton Plant) site is in Acton and Concord, Massachusetts. In 1954 W.R. Grace & Company purchased the property and began producing container sealing compounds, latex products, and paper and plastic battery separators. Effluent wastes from these operations flowed into several unlined lagoons and were later buried in onsite waste areas, including an industrial landfill. After a 1978 investigation revealed that ground water in the vicinity of the site was contaminated with VOCs, W.R. Grace & Company agreed to fully restore the aquifer. An aquifer restoration system was installed in 1985 which recovers and treats ground water under the site's waste disposal areas. Subsequent samplings, however, have indicated that the system has only minimally reduced the ground water contamination at the site. This first operable unit primarily addressed the source contamination and includes minimal modifications to the aquifer restoration system. Further ground water remediation will be addressed in a subsequent Record of Decision. The primary contaminants of concern affecting the soil, sediment, and sludge are VOCs including benzene and toluene, other organics, and metals including arsenic.

29096 (PB–90-164138/XAB) **Piecewise SALT (Selection At List Time) sampling for estimating suspended sediment yields. Forest Service general technical report (Final).** Thomas, R.B. Forest Service, Berkeley, CA (USA). Pacific Southwest Forest and Range Experiment Station. Jul 1989. 18p. (FSGTR-PSW–114). Available from NTIS, PC A03/MF A01.

A probability sampling method called SALT (Selection At List Time) has been developed for collecting and summarizing data on delivery of suspended sediment in rivers. It is based on sampling and estimating yield using a suspended-sediment rating curve for high discharges and simple random sampling for low flows. The method gives unbiased estimates of total yield and variance. The technique has been modified by replacing the rating curve with a user-specified average sampling rate function. This function allows easier specification of field sampling parameters for specified conditions and helps avoid the extremes of data collection. It also improves the distribution of samples if the intent is to estimate suspended sediment yield during storms specified after data collection. This form of SALT sampling is called piecewise SALT sampling.

29097 (PB–90-164849/XAB) **Proximity of Washington sanitary landfills to wetlands and deepwater habitats: Statewide resWults.** Moerlins, J.E.; Herndon, R.C.; Lambou, V.W.; Gebhard, R.L. Florida State Univ., Tallahassee, FL (USA). Center for Biomedical and Toxicological Research and Hazardous Waste Management. Feb 1990. 33p. Available from NTIS, PC A03/MF A01.

See also PB–90-164856.

Sanitary landfills can cause considerable harm to sensitive ecosystems if they are not properly located, designed, and managed. The purpose of the reports are to summarize the proximity of sanitary landfills in Washington to wetlands and deepwater habitats (i.e., rivers, lakes, streams, bays, etc.) and present data on the individual landfills. The sanitary landfills were identified on U.S. Fish and Wildlife Service's National Wetlands Inventory maps. These facilities have the potential to adversely affect sensitive ecosystems, such as wetlands and deepwater habitats, either through habitat alterations or through the migration of contaminants from sanitary landfills.

29098 (PB–90-164930/XAB) **Available disposal capacity for solid waste in Illinois: Third annual report.** Illinois Environmental Protection Agency, Springfield, IL (USA). Div. of Land Pollution Control. Dec 1989. 118p. (IEPA/LPC–89/902). Available from NTIS, PC A06/MF A01.

See also PB–89-134761.

Under the Illinois Solid Waste Management Act, IEPA is required to publish an annual report on the remaining landfill capacity in Illinois. It is the third annual report published by the IEPA. It details data on volumes of waste accepted at landfills in each county, as well as the reported remaining landfill capacity by county and region.

29099 (PB–90-165556/XAB) **Proximity of New Jersey sanitary landfills to wetlands and deepwater habitats: Statewide results.** Herndon, R.C.; Moerlins, J.E.; Lambou, V.W.; Gebhard, R.L. Florida State Univ., Tallahassee, FL (USA). Center for Biomedical and Toxicological Research and Hazardous Waste Management. Feb 1990. 33p. Available from NTIS, PC A03/MF A01.

See also PB–90-165564.

Sanitary landfills can cause considerable harm to sensitive ecosystems if they are not properly located, designed, and managed. The purpose of the reports are to summarize the proximity of sanitary landfills in New Jersey to wetlands and deepwater habitats (i.e., rivers, lakes, streams, bays, etc.) and present data on the individual landfills. Most sanitary landfills in New Jersey are located in or are close to either wetlands or deepwater habitats. All are located close to wetlands while more than half are close to deepwater habitats.

29100 (PB–90-165564/XAB) **Proximity of New Jersey sanitary landfills to wetlands and deepwater habitats: data on individual landfills.** Herndon, R.C.; Moerlins, J.E.; Lambou, V.W.; Gebhard, R.L. Florida State Univ., Tallahassee, FL (USA). Center for Biomedical and Toxicological Research and Hazardous Waste Management. Feb 1990. 26p. Available from NTIS, PC A03/MF A01.

See also PB–90-165556.

Sanitary landfills can cause considerable harm to sensitive ecosystems if they are not properly located, designed, and managed. The purpose of the report is to document the proximity of sanitary landfills included in the study in New Jersey to wetlands and deepwater habitats (i.e., rivers, lakes, streams, bays, etc.). The sanitary landfills were identified on U.S. Fish and Wildlife Service's National Wetlands Inventory maps. The data on individual landfills include: (1) general facility/site data, and (2) wetlands/deepwater habitat data.

29101 (PNRI-C(HP)–89010) **Radiological impact assessment of the hydrological characteristics of the area around PRR-1.** Paz, L.R. de la (Radiological Impact Assessment, Nuclear Regulations, Licensing and Safeguards Division, Philippine Nuclear Research Institute, Quezon City (Philippines)); — Palattao, M.V.B. Philippine Nuclear Research Inst., Diliman, Quezon City (Philippines). 1989. 27p. Order Number DE90624480. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The hydrologic characteristics of the PRR-1 site are discussed. A study of the rainfall and thyphoon behaviour in the areas around the site is made and the maximum precipitation characteristic is computed, with the probable maximum precipitation calculated as 1383.9 mm. The possible effects of accidental release of radioactivity on streams and waterways are discussed. An evaluation of the PNRI drainage system is made. (Author). 5 tabs.; 9 figs.; 9 refs.

29102 (UCRL–21008-Vol.4-Pt.2) **Evaluation of military field-water quality: Volume 4, Health criteria and recommendations for standards: Part 2, Interim standards for selected threat agents and risks from exceeding these standards.** Daniels, J.I. (ed.); Anspaugh, L.R.; Layton, D.W. Lawrence Livermore National Lab., CA (USA). Jan 1990. 185p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-48. Order Number DE90009942. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

The purpose of this report is to develop drinking-water standards for field water for selected threat agents of concern, including radioactivity. The threat agents of concern in addition to radioactivity are the classical chemical-warfare compounds hydrogen cyanide, organophosphorus nerve agents, and lewisite, as well as a fungal metabolite identified only recently as a possible threat agent, the trichothecene mycotoxin. The recommended standards are applicable only to military personnel deployed in the field, and they are meant to protect against performance-degrading effects resulting from the ingestion of the substances in field water. 25 refs., 11 figs., 19 tabs.

29103 (UCRL–102124) **Particle-grid methods for reacting flows in porous media: Application to Fisher's Equation.** Tompson, A.F.B. (Lawrence Livermore National Lab., CA (USA)); Dougherty, D.E. Lawrence Livermore National Lab., CA (USA). Feb 1990. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9006156–1: 8. international conference on computational methods in water resources, Venice (Italy), 11-15 Jun 1990). Order Number DE90009437. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Recent investigations have shown the particle tracking method to be a viable and efficient method for solving equations describing nonreactive mass transport in porous media. The approach is particularly useful for solving multidimensional, densely gridded problems, is readily implemented on parallel and vector architecture computers, and may be extended for use in multicomponent or nonconservative problems. In this paper, we briefly outline a specific framework in which the method can be applied to reactive problems and demonstrate its use to solve a particular diffusion-reaction system described by the so-called Fisher's Equation. 12 refs., 2 figs.

29104 (UCRL–102781) **Cooperative LLNL/HAZWRAP project to demonstrate determination of field-based retardation factors: Part 3: Algorithm to determine a field-based retardation factor.** Rogers, L.L.; Rice, D.W. Jr.; Bishop, D.J.; Stout, N.D. Lawrence Livermore National Lab., CA (USA). Jan 1990. 15p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900210–45: 16. annual waste management symposium: working towards a cleaner environment, Tucson, AZ (USA), 25 Feb - 1 mar 1990). Order Number DE90009578. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Current limitations of field and laboratory technologies make it difficult to determine a distribution coefficient which is necessary to calculate a field-based retardation factor. At Lawrence Livermore

National Laboratory, an ongoing study is refining a method to assess the existing partitioning of trichloroethylene (TCE) and perchloroethylene (PCE) between the solid and liquid phases of the aquifer system. The three main components of this method involve (1) measurement of the total VOCs in saturated alluvial deposits, (2) measurement of sediment properties, and (3) measurement of the VOCs in pore water. The design and implementation of new measurement techniques and protocols are being compared to traditional measurement protocols. An overview of these new measurement protocols is presented here along with the algorithm that calculates the field-based retardation factors. A sensitivity analysis is presented to demonstrate the required accuracy of the individual measurements needed to meet the desired accuracy of the final retardation factors. 13 refs., 6 figs., 1 tab.

29105 (UCRL–102790) **Cooperative LLNL/HAZWRAP project to demonstrate determination of field-based retardation factors: Part 2, Determination of sorption constants.** Bishop, D.J.; Rice, D.W. Jr.; Rogers, L.L. Lawrence Livermore National Lab., CA (USA). Jan 1990. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900210–43: 16. annual waste management symposium: working towards a cleaner environment, Tucson, AZ (USA), 25 Feb - 1 mar 1990). Order Number DE90009580. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In a demonstration of methods to measure field-based retardation factors, a number of investigations are underway to determine the relationship between field-based measurements for calculating sorption constants (K_ds) and those determined from batch sorption experiments in the laboratory. Field-based (K_ds) are site or sediment specific, and laboratory (K_ds) provide an upper boundary for sorption capacity. Studies have been initiated to predict the rate and extent of lateral and vertical migration of volatile organic compounds (VOCs) in ground water beneath and in the vicinity of the Lawrence Livermore National Laboratory (LLNL) site in Livermore, California. A preliminary ground water study of this area indicated the presence of VOCs, primarily perchloroethylene and trichloroethylene, generally in the tens of parts-per-billion range. Cores from the completion zone of approximately 50 different LLNL monitor wells were selected for analysis for a number of physical and chemical properties including organic carbon content, cation exchange capacity, and grain size distribution. Additionally, cores from the saturated and unsaturated zones of four HAZWRAP-sponsored boreholes were studied. (K_ds) were determined from sorption experiments performed on samples from each of the cores. A pooled group of cores from one borehole was separated into sand, silt, and clay fractions that were individually analyzed. 15 refs., 3 figs., 3 tabs.

29106 (UCRL–102859) **Cooperative LLNL/HAZWRAP project to demonstrate determination of field-based retardation factors: Part 1, Distribution of perchloroethylene around and within permeable zones in saturated alluvial deposits.** Rice, D.W. Jr.; Bishop, D.J.; Rogers, L.L. Lawrence Livermore National Lab., CA (USA). Jan 1990. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900210–44: 16. annual waste management symposium: working towards a cleaner environment, Tucson, AZ (USA), 25 Feb - 1 mar 1990). Order Number DE90009577. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

As part of a cooperatively sponsored HAZWRAP and Lawrence Livermore National Laboratory (LLNL) project to evaluate field-based methods to measure retardation factors, we investigated some aspects of the variability associated with measuring the concentrations of perchloroethylene (PCE) within the saturated unconsolidated alluvial sediments beneath LLNL. Using the depth-sampling technique developed at LLNL, we are describing the relationship of VOC spatial variability to various sediment characteristics such as geophysical log results, grain size distribution, cation exchange capacity, total organic carbon, permeability, bulk density, skeletal density, and porosity. An algorithm is being developed to calculate representative field-based partitioning coefficients and retardation factors (R). The two major sources of sediment PCE concentration variability examined were those associated with the analytical extraction methods and the spatial changes in fine-grained materials within permeable and confining sediments. To evaluate desorption efficiency during headspace extraction for VOC analyses, a bulk thermal desorption chamber (BTDC) was constructed and calibrated. We used both headspace and BTDC analytical results to describe the vertical distribution of PCE in four adjacent boreholes. 14 refs., 6 figs., 1 tab.

29107 (WHC-EP–0145-1) **Westinghouse Hanford Company environmental surveillance annual report--200/600 Areas, calendar year 1988.** Elder, R.E.; McKinney, S.M.; Osborne, W.L. Westinghouse Hanford Co., Richland, WA (USA). May 1989. 127p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-87RL10930. Order Number DE90008201. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

This document presents the results of near-field environmental surveillance as performed by Westinghouse Hanford Company in 1988 of the Operations Area of the Hanford Site, Washington State. These activities are conducted in the 200 and 600 Areas to assess and control the impacts of operations on the worker and the local environment. Surveillance activities include sampling and analysis of ambient air, surface water, groundwater, sediments, soil, and biota. External radiation measurements and radiological surveys of waste disposal sites, radiological control areas, and roads are also performed. 18 refs., 3 figs.

29108 Hydrology, community structure, and productivity patterns of a dystrophic Carolina bay wetland. Schalles, J.F. (Creighton Univ., Omaha, NE (USA)); Shure, D.J. *Ecological Monographs (USA)*, 59(4): 365-385 (Dec 1989).

A shallow, 5.4-ha dystrophic Carolina bay wetland was studied between 1974 and 1978 to test the premise that biomass and production are constrained by the stagnant hydrology and dilute, acidic chemistry of bay wetlands. Our objectives were to evaluate: (1) surface and subsurface hydrology, (2) sources of production, (3) community change along a depth gradient, and (4) seasonal community patterns. The hydrology study compared surface water levels to groundwater levels in four adjacent wells. A cylinder enclosure and total harvest procedure and 24-h dissolved oxygen curves were used for 2 yr in a 1-ha sampling area to measure spatial and temporal biomass patterns and organic production of community components.

29109 Experimental verification of multicomponent ground water contamination predictions. Clancy, K.M. (Waste Management Division, Lansing, MI (USA)); Jennings, A.A. *Water Resources Bulletin (USA)*, 24(2): 307-316 (Apr 1988). DOE Contract AC02-79EV10253.

Recent advances in mass transport modeling have made possible computation of the theoretical consequences of intricate multicomponent species interactions during ground water contamination events. Predictions such as strong chromatographic effects and induced downstream precipitations may have considerable impact on environmental analysis and regulation. Results of laboratory attempts to verify theoretical multicomponent transport predictions of energy-related contaminants such as cadmium, zinc, arsenic and selenium are discussed. Evidence presented here indicates that natural variability of soil properties make such verifications difficult. Although species interactions are easily confirmed, dramatic effects often exist only within small mathematical windows in strongly variable coefficient sets. Currently, the ability to generate multicomponent predictions apparently exceeds the ability to quantify the necessary, presumably deterministic, information required for real soils.

29110 Model predictions of watershed erosion components. Hetrick, D.M. (Oak Ridge National Laboratory, TN (USA)); Travis, C.C. *Water Resources Bulletin (USA)*, 24(2): 413-419 (Apr 1988). DOE Contract AC05-84OR21400.

Model predictions for surface runoff and sediment yield from the coupled SESOIL/EROS soil compartment model are compared with empirical measurements from three watersheds. The model is summarized and descriptions are given for the two corn field watersheds and one grassland watershed used in the analysis. Model performance and limitations are discussed.

29111 Polymer bead containing immobilized metal extractant. Seidel, D.; Jeffers, T. To Department of the Interior, Washington, DC (US). USA Patent Application 7-429,326. 18 Oct 1989. 16p. Available from NTISPC N03/MF A01.

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

The invention relates to the preparation of beads containing immobilized extractants of either biomass material, organic solvents or mixtures of biomass material and organic solvent materials. These beads are used to effectively remove metal contaminants present in low concentrations from dilute solutions, such as processing streams and waste waters. Removal of the metal values from these extractants is accomplished by using dilute mineral acids or other dilute solutions to solubilize the metal.

29113 (AD-A–217017/3/XAB) **Key involvement of poly (ADP-ribosylation) in defense against toxic agents in molecular biology studies. Annual report, November 1988-November 1989.** Smulson, M.E. Georgetown Univ., Washington, DC (USA). School of Medicine. 15 Nov 1989. 15p. Available from NTIS, PC A03/MF A01.

The program has 3 interrelated aims. The first stage involves recombinant construction of polymerase cDNA into a family of selected expression vectors which in most cases will possess an inducible promoter. During the first year, the cDNA was inserted in both sense and antisense orientations and also site-directed mutants. We were also concerned with construction (I-D) and expression of site-directed mutants and potential inhibitory peptides in vivo in order to eventually modulate the activity of poly(ADP-Rib) polymerase in cells, upon induction during DNA repair. Various expression vectors will be stably transfected into eukaryotic cells generally by co-transfection with a selectable gene. We expect various levels of overexpression and underexpression of poly(ADP-Rib) polymerase. In the case of the site-directed mutants and the inhibitory peptides (IID), we anticipate cells with reduced capacity for ADP-ribosylation. Biochemical and molecular biological characterizations of the gene products of the various transfected cells are proposed prior to cytotoxicity or DNA repair analysis. These will include: Southern analysis to confirm integrated copies of the cDNA; both Northern and primer extension analysis of cellular mRNA to confirm that upon induction actual expression of the foreign gene occurs; and immunoprecipitation of poly(ADP-Rib) polymerase in vivo after induction.

29114 (DOE/ER/13198–4) **Structure and function of Frankia vesicles in dinitrogen fixing actinorhizal plants: Final report, April 1, 1984–December 31, 1989.** Torrey, J.G. Harvard Univ., Petersham, MA (USA). Harvard Forest. [1990]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER13198. Order Number DE90009460. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Frankia, a filamentous bacterium which induces N_2-fixing root nodules on the roots of a wide range of woody dicotyledonous plants, is the first known actinomycete which fixes dinitrogen when growing in free-living culture. The nitrogenase enzyme is induced in many strains of this organism by withholding fixed nitrogen compounds from its nutrient medium. Our studies have concerned the physiology, biochemistry and structural development of the N_2-fixing apparatus in Frankia grown in vitro and in root nodules of host plants. Diverse strains of Frankia were isolated and cultured from different host plants and vesicle form and function were studied. Two strains were studied, HFPArI3, an isolate from nodules of the red alder Alnus rubra and HFPCcI3 isolated from root nodules of the tropical tree Casuarina cunninghamiana. The goal was to understand the structure and function which leads to optimum effectiveness for dinitrogen fixation. 13 refs.

29115 (DOE/ER/13704–3) **[Processing and targeting of the thiol protease aleurain]: Progress report.** Rogers, J.C. Washington Univ., St. Louis, MO (USA). Dept. of Hematology and Oncology. [1990]. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER13704. Order Number DE90009522. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Our goal for work during the past two years under this Grant was to characterize the barley thiol protease, aleurain, to determine if it is secreted or retained intracellularly in aleurone cells, and to begin to elucidate structural features that might control targeting of the protein to its final destination. We have shown that aleurain is synthesized as a proenzyme with two N-linked oligosaccharide chains, one high mannose-type and one complex-type. Aleurain undergoes processing to mature form by removal of an Nterminal prosegment, and is retained intracellularly; it cannot be detected among proteins secreted from aleurone cells. Treatment of aleurone cells with tunicamycin to prevent glycosylation of aleurain does not prevent processing of the unglycosylated form. The N-terminal portion of aleurain's prosegment is homologous to the comparable region in two yeast vacuolar proteases, where that region is known to contain the signal necessary for targeting the proteases to the vacuole. 18 refs., 7 figs.

29117 (LA-UR–90-705) **Real-time Fourier transform spectrometry for fluorescence imaging and flow cytometry.** Buican, T.N. Los Alamos National Lab., NM (USA). [1990]. 9p. Sponsored by U.S. Department of Health and Human Services. DOE Contract W-7405-ENG-36. (CONF-900140–20: SPIE optics, electro-optics and laser applications in science and engineering conference and exhibition, Los Angeles, CA (USA), 15-19 Jan 1990). Order Number DE90008992. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We present a Fourier transform (FT) spectrometer that is suitable for real-time spectral analysis in fluorescence imaging and flow cytometry. The instrument consists of a novel type of interferometer that can be modulated at frequencies of up to 100 kHz and has a high light throughput; and a dedicated, parallel array processor for the real-time computation of spectral parameters. The data acquisition array processor can be programmed by a host computer to perform any desired linear transform on the interferogram and can thus separate contributions from multiple fluorescence microscopy. The integration of a flow cytometer and a spectral imaging fluorescence microscope is discussed, and the concepts of direct and reversed "virtual sorting" are introduced. 9 refs., 8 figs.

29118 Extraction of pectins and hemicelluloses from cell walls of suspension culture cells of cotton by endopolygalacturonase treatment. An, Jinhua (Oklahoma State Univ., Stillwater (USA)); Maness, N.O.; Mort, A.J. *Plant Physiology, Supplement (USA)*, 89(4): 142 (Apr 1989).

Walls of cotton suspension cultures were treated with a highly purified endopolygalacturonase coded for by a gene from Erwinia carotovora expressed in E. coli. About 80 percent of the walls galacturonic acid was solubilized and could be fractionated by ion exchange chromatography into three classes: (1) tri- and tetragalacturonides from digestion of homogalacturonans, (2) high molecular weight fragments rich in galacturonic acid, rhamnose and other neutral sugars indicative of rhamnogalacturonan I, and (3) a well defined low molecular weight polymer resembling rhamnogalacturonan II. Treatment of the insoluble wall residue with alkali allowed extraction of the remainder of the wall galacturonic acid as high molecular weight polymers resembling rhamnogalacturonan I but in association with what is probably xyloglucan. The purified polymers will be compared to those obtained by others from different species, especially those of sycamore.

29119 A new method for measuring degree of methyl esterification in pectin. Maness, N.O. (Oklahoma State Univ., Stillwater (USA)); Ryan, J.D.; Mort, A.J. *Plant Physiology, Supplement (USA)*, 89(4): 142 (Apr 1989).

A simple method to measure the degree of methyl esterification in small samples of pectins or isolated cell walls will be described. The method involves selective reduction of methyl esterified galacturonic acid to galactose with sodium borohydride or sodium borodeuteride in the presence of strong buffer at 4 C. Quantitative reduction of samples can be accomplished in 1 h using 20 mg borohydride per mg sample. The degree of pectin methyl esterification can then be determined by measuring an increase of galactose using gas chromatography (borohydride reduced samples) or gas chromatography/mass spectroscopy (borodeuteride reduced samples), or by measuring the decrease in galacturonic acid using conventional colorimetric methods. Pectin samples as small as 50 μg have been analyzed using the reduction method with good results.

29120 Early changes in protein expression of barley following inoculation with erysiphe graminis f. sp. hordei. Simons, S.P. (Michigan State Univ., East Lansing (USA)); Somerville, S.C. *Plant Physiology, Supplement (USA)*, 89(4): 165 (Apr 1989).

Erysiphe graminis f. sp. hordei is an obligate pathogen of barley causing the powdery mildew disease. Resistance to this disease is the product of a highly specific interaction between barley lines with specific resistance alleles and pathogen races carrying complementary avirulence alleles. Using congenic barley lines which differ at the M1-a disease reaction locus, we hope to define the early molecular events of this interaction. Accordingly, resistant and susceptible barley seedlings were labelled with ^{35}S-methionine and examined by two-dimensional electrophoresis at two hour intervals following inoculation. Infection related changes were observed with both isolines during the four to twelve hour time period. Additional differences existed constitutively between the barley lines. These differences have been quantified. Further characterization of these proteins will yield useful markers for events preceding or coinciding with cytological responses any may lead to identification and cloning of the M1-a gene.

29121 The bean α-amylase inhibitor is encoded by a lectin gene. Moreno, J. (Univ. of California, San Diego, La Jolla (USA)); Altabella, T.; Chrispeels, M.J. *Plant Physiology, Supplement (USA)*, 89(4): 169 (Apr 1989).

The common bean, Phaseolus vulgaris, contains an inhibitor of insect and mammalian α-amylases that does not inhibit plant α-amylase. This inhibitor functions as an anti-feedant or seed-defense protein. We purified this inhibitor by affinity chromatography and found that it consists of a series of glycoforms of two polypeptides (Mr 14,000-19,000). Partial amino acid sequencing was carried out, and the sequences obtained are identical with portions of the derived amino acid sequence of a lectin-like gene. This lectin gene encodes a polypeptide of MW 28,000, and the primary in vitro translation product identified by antibodies to the α-amylase inhibitor has the same size. Co- and posttranslational processing of this polypeptide results in glycosylated polypeptides of 14-19 kDa. Our interpretation of these results is that the bean lectins constitute a gene family that encodes diverse plant defense proteins, including phytohemagglutinin, arcelin and α-amylase inhibitor.

29122 Phenotypic expression of wild-type tomato and three wilty mutants in relation to abscisic acid accumulation in roots and leaflets of reciprocal grafts. Cornish, K. (Michigan State Univ., East Lansing (USA)); Zeevaart, J.A.D. *Plant Physiology (USA)*, 87(1): 190-194 (May 1988). DOE Contract AC02-76ER01338.

Lycopersicon esculentum Mill. cv Rheinlands Ruhm (RR) and cv Moneymaker and the three wilty mutants flacca (flc), sitiens (sit), and sitiens^{w} (sit^{w}), together with the most reciprocal grafts, were grown in pots and in solution culture. Detached leaflets, and control and stem-girdled intact plants, were left turgid or were wilted in air. Detached leaflets and the leaflets and roots of the intact plants were analyzed for their abscisic acid (ABA) content. Turgid RR leaflets contained about 2.9 ng ABA per miligram dry weight. On average, the flc and sit leaflets contained 33 and 11% of this amount, respectively. The lack of ABA approximately correlated with the severity of the mutant phenotype. Mutant roots also contained less ABA than wild-type roots. Wild-type scions on mutant stocks (wild type/mutant) maintained the normal phenotype of ungrafted plants. Mutant scions grafted onto wild-type stocks reverted to a near wild-type phenotype. After the wild-type leaves were excised from solution culture-grown mutant/wild-type plants, the revertive morphology of the mutant scions was maintained, although endogenous ABA levels in the leaflets fell to typical mutant levels and the leaflets became wilty again. When stressed in air, both leaflets and roots of RR plants produced stress-induced ABA, but the mutant leaflets and roots did not. The roots and leaflets of the grafted plants behaved according to their own genotype, with the notable exception of mutant roots grown with wild-type scions. Roots of flc and sit^{w} recovered the ability to accumulate stress-induced ABA when grafted with RR scions before the stress was imposed.

29123 Immunocytochemical localization of the vacuolar H^{+}-ATPase in maize root tip cells. Hurley, D. (Univ. of California, Santa Cruz (USA)); Taiz, L. *Plant Physiology (USA)*, 89(2): 391-395 (Feb 1989). DOE Contract FG03-84ER13245.

The vacuolar H^{+}-ATPase of maize (Zea mays L.) root tip cells has been localized at the EM level using rabbit polyclonal antibodies to the 69 kilodalton subunit and protein A-colloidal gold. Intracellular gold particles were detected mainly on the tonoplast and Golgi membranes. Only about 27% of the vacuoles were labeled above background. The absence of gold particles on the majority of vacuoles suggests either that the tonoplast H^{+}-ATPase is degraded during tissue preparation or that the small vacuoles of root tip cells are specialized with respect to H^{+}-ATPase activity. The pattern of gold particles on the labeled vacuoles ranged from uniform to patchy. Virtually all of the Golgi bodies were labeled by the antibody, but the particle densities were too low to determine whether the H^{+}-ATPase was associated with specific regions, such as the trans-face. Cell wall-labeling was also observed which could be partially prevented by the inclusion of gelatin as a blocking agent. The immunocytochemical results confirm previous biochemical studies with isolated membrane fractions.

29124 N-terminus conservation in the terminal pigment of phycobilisomes from a prokaryotic and eukaryotic alga. Gantt, E. (Smithsonian Institution, Washington, DC (USA)); Cunningham, F.X. Jr.; Lipschultz, C.A.; Mimuro, M. *Plant Physiology (USA)*, 86(4): 996-998 (Apr 1988). DOE Contract AS05-76ER04310.

High molecular weight polypeptides from phycobilisomes, believed to be involved in facilitating the energy flow from phycobilisomes to thylakoids, are conserved in the prokaryote Nostoc sp. and the eukaryote Porphyridium cruentum. Partial N-terminal sequence analysis of the phycobilisome-polypeptides of Nostoc (94 kilodalton) and Porphyridium (92 kilodalton) revealed 55% identity in the first 20 residues, but no significant homology with sequences of other phycobiliproteins or phycobilisome-linkers. Polypeptides (94 and 92 kilodalton) from Nostoc thylakoids free of phycobilisomes, previously presumed to be involved in the phycobilisome-thylakoid linkage exhibit the same immunocrossreactivity but are different

from the 94 kilodalton-phycobilisome polypeptide by having blocked N-termini and a different amino acid composition.

29125 Induction and accumulation of heat shock-specific poly(A+) RNAs and proteins in soybean seedlings during arsenite and cadmium treatments. Edelman, L. (Univ. of Georgia, Athens (USA)); Czarnecka, E.; Key, J.L. *Plant Physiology (USA)*, 86(4): 1048-1056 (Apr 1988). DOE Contract AS09-80ER10678.

Northern blot hybridization analyzes revealed that poly(A+) RNAs homologous to eight heat shock (HS)-specific cDNA clones were induced by arsenite (As) or Cd treatments. The mRNAs accumulated slower, and maximum accumulations were consistently lower than HS-induced levels. Prolonged treatment with low concentrations (50-100 micromolar) of As for 6 hours, or Cd for 12 hours, resulted in decreased accumulations of HS-specific mRNAs. This response resembled the autoregulation observed during continuous 40°C HS. However, no autoregulation was evident when soybean seedlings were exposed to high concentrations of As (250 micromolar) or Cd (1 millimolar) for 12 hours. The cDNA probe pCE54 detected a second higher molecular weight poly(A+) RNA following As or Cd treatments which accumulated concomitantly with the lower molecular weight HS-specific poly(A+) RNA. The patterns of low molecular weight HS polypeptides from in vitro translations induced by HS, As, and Cd, and analyzed by one-dimensional and two-dimensional SDS-PAGE, were similar but temporal differences were apparent. The chemical agents used in this study apparently induced the accumulation and translation of HS messages in vivo but not in the selective manner as observed during HS treatment.

29126 Cloning of a Thermomonospora fusca xylanase gene and its expression in Escherichia coli and Streptomyces lividans. Ghangas, G.S. (Cornell Univ., Ithaca, NY (USA)); Hu, Y.J.; Wilson, D.B. *Journal of Bacteriology (USA)*, 171(6): 2963-2969 (Jun 1989). DOE Contract FG02-84ER13233.

Thermomonospora fusca chromosomal DNA was partially digested with EcoRI to obtain 4- to 14-kilobase fragments, which were used to construct a library of recombinant phage by ligation with EcoRI arms of λgtWES.λB. A recombinant phage coding for xylanase activity which contained a 14-kilobase insert was identified. The xylanase gene was localized to a 2.1-kilobase SalI fragment of the EcoRI insert by subcloning onto pBR322 and derivatives of pBR322 that can also replicate in Streptomyces lividans. The xylanase activity produced by S. lividans transformants was 10- to 20-fold higher than that produced by Escherichia coli transformants but only one-fourth the level produced by induced T. fusca. A 30-kilodalton peptide with activity against both Remazol brilliant blue xylan and xylan was produced in S. lividans transformants that carried the 2.1-kilobase SalI fragment of T. fusca DNA and was not produced by control transformants. T. fusca cultures were found to contain a xylanase of a similar size that was induced by growth on xylan or Solka Floc. Antiserum directed against supernatant proteins isolated from a Solka Floc-grown T. fusca culture inhibited the xylanase activity of S. lividans transformants. The cloned T. Fusca xylanase gene was expressed at about the same level in S. lividans grown in minimal medium containing either glucose, cellobiose, or xylan. The xylanase bound to and hydrolyzed insoluble xylan. The cloned xylanase appeared to be the same as the major protein in xylan-induced T.fusca culture supernatants, which also contained at least three additional minor proteins with xylanase activity and having apparent molecular masses of 43, 23, and 20 kilodaltons.

29127 N_2O reduction and HD formation by nitrogenases from a nifV mutant of Klebsiella pneumoniae. Liang, J. (Univ. of Wisconsin, Madison (USA)); Burris, R.H. *Journal of Bacteriology (USA)*, 171(6): 3176-3180 (Jun 1989). DOE Contract FG02-87ER13707.

Dinitrogenase from a nifV mutant of Klebsiella pneumoniae contains an altered form of iron-molybdenum cofactor (FeMoco) that lacks a biologically active homocitric acid molecule. Change in the composition of FeMoco led to substantial variation in the kinetics of nitrogenase action. The K_ms of the mutant enzyme for N_2 and N_2O were 0.244 and 0.175 atm (24,714 and 17,726 kPa), respectively. The K_m for N_2 was higher and the K_m for N_2O was lower than that for the wild-type enzyme. The mutant enzyme was ineffective in N_2 fixation, in N_2O reduction, and in HD formation, as indicated by the low V_{max} of these reactions with saturating levels of substrate and under conditions of saturating electron flux. These observations provide further support for the concept that N_2, N_2O, and D_2 interact with the same form of dinitrogenase. H_2 evolution by the mutant enzyme is only partially inhibited by CO. Observation that different numbers of electrons are stored in CO-inhibited than in noninhibited dinitrogenase before H_2 is released suggests that the mutant enzyme has more sites responsible for H_2 evolution than the wild-type enzyme, whose H_2 evolution is not inhibited by CO.

29128 Ammonium inhibition of nitrogenase activity in Herbaspirillum seropedicae. Fu, H. (Univ. of Wisconsin, Madison (USA)); Burris, R.H. *Journal of Bacteriology (USA)*, 171(6): 3168-3175 (Jun 1989). DOE Contract FG02-87ER13707.

The effect of oxygen, ammonium ion, and amino acids on nitrogenase activity in the root-associated N_2-fixing bacterium Herbaspirillum seropedicae was investigated in comparison with Azospirillum spp. and Rhodospirillum rubrum. H. seropedicae is microaerophilic, and its optimal dissolved oxygen level is from 0.04 to 0.2 kPa for dinitrogen fixation but higher when it is supplied with fixed nitrogen. No nitrogenase activity was detected when the dissolved O_2 level corresponded to 4.0 kPa. Ammonium, a product of the nitrogenase reaction, reversible inhibited nitrogenase activity when added to derepressed cell cultures. However, the inhibition of nitrogenase activity was only partial even with concentrations of ammonium chloride as high as 20 mM. Amides such as glutamine and asparagine partially inhibited nitrogenase activity, but glutamate did not. Nitrogenase in crude extracts prepared from ammonium-inhibited cells showed activity as high as in extracts from N_2-fixing cells. The pattern of the dinitrogenase and the dinitrogenase reductase revealed by the immunoblotting technique did not change upon ammonium chloride treatment of cells in vivo. No homologous sequences were detected with the draT-draG probe from Azospirillum lipoferum. There is no clear evidence that ADP-ribosylation of the dinitrogenase reductase is involved in the ammonium inhibition of H. seropedicae. The uncoupler carbonyl cyanide m-chlorophenylhydrazone decreased the intracellular ATP concentration and inhibited the nitrogenase activity of whole cells. The ATP pool was significantly disturbed when cultures were treated with ammonium in vivo.

29129 DNA sequence and regulation of the gene (cbpA) encoding the 42-kilodalton cytoplasmic membrane carotenoprotein of the cyanobacterium Synechococcus sp. strain PCC 7942. Reddy, K.J. (Univ. of Missouri-Columbia (USA)); Masamoto, K.; Sherman, D.M.; Sherman, L.A. *Journal of Bacteriology (USA)*, 171(6): 3486-3493 (Jun 1989). DOE Contract FG02-86ER13516.

The gene (cbpA) coding for a carotenoid-binding protein of the cyanobacterium Synechococcus sp. strain PCC 7942 (Anacystis nidulans R2) has been cloned and sequenced. A polyclonal antibody against the protein was used to identify immunoreactive clones from a λgt11 expression library of Synechococcus strain PCC 7942. The initial positive clone (λgtAN42) contained a 0.9-kilobase (kb) chromosomal fragment, which was used to detect a larger chromosomal fragment from a λEMBL3 library. The λEMBL3 recombinant, λEM109, contained an 18-kb portion of the Synechococcus strain PCC 7942 chromosome. The open reading frame of cbpA encoded 450 amino acids which give rise to a protein of 49,113 daltons. The hydrophobicity plot indicates that the protein may have a 49-residue signal sequence which is cleaved to yield a mature protein of 43,709 daltons. The protein has been localized in the cytoplasmic membrane by biochemical procedures as well as by electron microscopic immunocytochemistry. Northern (RNA) blot analysis indicates that transcription of cbpA is tightly regulated by DNA topology, light intensity, and iron concentration. Transcription is greatly induced by growth under high light intensities and repressed during growth under iron-deficient conditions. The DNA gyrase inhibitor novobiocin specifically inhibited the light-induced transcription. In Northern blots, the gene-specific probe hybridized to two size classes of RNA, with lengths of 2.0 and 6.2 kb. Since cbpA appears to be a component of the 6.2-kb transcript, it is likely part of a larger operon.

29130 Novel and remarkably thermostable ferredoxin from the hyperthermophilic archaebacterium Pyrococcus furiosus. Aono, S. (Univ. of Georgia, Athens (USA)); Bryant, F.O.; Adams,

M.W.W. *Journal of Bacteriology (USA)*, 171(6): 3433-3439 (Jun 1989). DOE Contract FG09-88ER13901.

The archaebacterium Pyrococcus furiosus is a strict anaerobe that grows optimally at 100°C by a fermentative-type metabolism in which H_2 and CO_2 are the only detectable products. A ferredoxin, which functions as the electron donor to the hydrogenase of this organism was purified under anaerobic reducing conditions. The study shows that P. furiosus ferredoxin is therefore distinct from other ferredoxins in that the bulk of its iron is not present as iron-sulfur clusters with an S = 1/2 ground state. The apoferredoxin was reconstituted with iron and sulfide to give a protein that was indistinguishable from the native ferredoxin by its iron content and electron paramagnetic resonance properties, which showed that the novel iron-sulfur clusters were not artifacts of purification. The reduced ferredoxin also functioned as an electron donor for H_2 evolution catalyzed by the hydrogenase of the mesophilic eubacterium Clostridium pasteurianum. P. furiosus ferredoxin was resistant to denaturation by sodium dodecyl sulfate (20%, wt/vol) and was remarkably thermostable. Its UV-visible absorption spectrum and electron carrier activity to P. furiosus hydrogenase were unaffected by a 12-h incubation at 95°C.

29131 (DOE/ER/25019–16) **The Sherman-Rinzel-Keizer model for bursting electrical activity in the pancreatic β-cell.** Pernarowski, M. (Washington Univ., Seattle, WA (USA). Dept. of Applied Mathematics); Kevorkian, J.; Miura, R.M. Washington Univ., Seattle, WA (USA). Dept. of Applied Mathematics. Mar 1990. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-86ER25019. Order Number DE90010423. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Pancreatic β-cells exhibit periodic bursting electrical activity (BEA) consisting of active and silent phases. The Sherman-Rinzel-Keizer (SRK) model of this phenomenon consists of three coupled first-order nonlinear differential equations which describe the dynamics of the membrane potential, the activation parameter for the voltage-gated potassium channel, and the intracellular calcium concentration. These equations are nondimensionalized and transformed into a Lienard differential equation coupled to a single first-order differential equation for the slowly changing nondimensional calcium concentration. Leading-order perturbation problems are derived for the silent and active phases of the BEA on slow and fast time scales. Numerical solutions of these leading-order problems are compared with those for the exact equation in their respective regions. The leading-order solution in the active phase has a limit cycle behavior with a slowly varying frequency. It is observed that the "damping term" in the Lienard equation is small numerically. 26 refs., 6 figs., 2 tabs.

29132 (AD-A–216496/0/XAB) **Design of oligonucleotides which attack specific gene targets. Annual report, December 1988-November 1989.** Hogan, M.E. Baylor Coll. of Medicine, The Woodlands, TX (USA). Center for Biotechnology. 8 Dec 1989. 19p. Available from NTIS, PC A03/MF A01.

During the first year of Navy support, we have refined our understanding of triple helix formation and in the process, have synthesized a set of triplex forming oligonucleotides directed against sites in the control region of interesting eukaryotic genes. We have shown that, in favorable instances, the dissociation constant for triplex formation can exceed 10-9M under physiological conditions. Work has begun to extend those structural analyses, by application of molecular modeling and 2D NMR methods. Work has also begun to apply photochemical analysis of triplex formation for the purpose of mapping triplex formation on gene target sites (HPRT and EGFR) within intact eukaryotic cells.

29133 3H nuclear magnetic resonance study of anaerobic glycolysis in packed erythrocytes. Newmark, R.D. (Lawrence Berkeley Laboratory, CA (USA)); Un, S.; Williams, P.G.; Carson, P.J.; Morimoto, H.; Klein, M.P. *Proceedings of the National Academy of Sciences of the United States of America (USA)*, 87(2): 583-587 (Jan 1990).

The utility and power of 3H NMR spectroscopy as a technique for monitoring biological systems in vivo is illustrated with glucose metabolism in erythrocytes. Use of C-1-tritiated glucose allowed us to monitor the disappearance of the alpha and beta tritons, with the production of lactate and 1H3HO (HTO), as well as some intermediates. Spin lattice relaxation times (T1) were measured to avoid T1 distortion of the spectral intensities. Detection of the formation of 1 mM tritiated water in the presence of 110 M H2O protons and deuterons allows the eventual fate of the label in the pentose shunt to be observed in vivo.

29134 Modulation of alcohol dehydrogenase isoenzyme levels in zymomonas mobilis by iron and zinc. Mackenzie, K.F. (Univ. of Florida, Gainesville (USA)); Eddy, C.K.; Ingram, L.O. *Journal of Bacteriology (USA)*, 171(2): 1063-1067 (Feb 1989).

Zymomonas mobilis is an unusual microorganism which utilizes both iron-containing alcohol dehydrogenase (ADHII) and zinc-containing alcohol dehydrogenase (ADHI) isoenzymes during fermentative growth. This organism is obligately ethanologenic, and alcohol dehydrogenase activity is essential. The activities of ADHI and ADHII were altered by supplementing growth medium with iron or zinc salts and by iron starvation. Growth under iron-linking conditions (chelators, minimal medium) reduced ADHII activity but did not prevent the synthesis of the ADHII protein. The inactive form of this enzyme appeared quite stable, was not renatured by iron addition, and persisted in the cell. The iron-induced increase in ADHII activity required de novo synthesis which was blocked by antibiotic additions. The ability of Z. mobilis to synthesize ADHII and ADHI may be advantageous in nature.

29135 (FNAL-TM–1656) **Technical assessment of the Loma Linda University proton therapy accelerator.** Fermi National Accelerator Lab., Batavia, IL (USA). Oct 1989. 124p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE90008184. Available from NTIS, PC A06/MF A01; OSTI; INIS.

In April 1986, officials of Loma Linda University requested that Fermilab design and construct a 250 MeV proton synchrotron for radiotherapy, to be located at the Loma Linda University Medical Center. In June 1986 the project, having received all necessary approvals, commenced. In order to meet a desirable schedule providing for operation in early 1990, it was decided to erect such parts of the accelerator as were complete at Fermilab and conduct a precommissioning activity prior to the completion of the building at Loma Linda which will house the final radiotherapy facility. It was hoped that approximately one year would be saved by the precommissioning, and that important information would be obtained about the system so that improvements could be made during installation at Loma Linda. This report contains an analysis by Fermilab staff members of the information gained in the precommissioning activity and makes recommendations about steps to be taken to enhance the performance of the proton synchrotron at Loma Linda. In the design of the accelerator, effort was made to employ commercially available components, or to industrialize the products developed so that later versions of the accelerator could be produced industrially. The magnets could only be fabricated at Fermilab if the schedule was to be met, but efforts were made to transfer that technology to industry. Originally, it was planned to use a 1.7 MeV RFQ fabricated at the Lawrence Berkeley Laboratory as injector, but LBL would have found it difficult to meet the project schedule. After consideration of other options, for example a 3.4 MeV tandem accelerator, a supplier (AccSys Inc.) qualified itself to provide a 2 MeV RFQ on a schedule well matched to the project schedule. This choice was made, but a separate supplier was selected to develop and provide the 425 MHz power amplifier for the RFQ.

29136 (KEK–89-5, pp. 92-98) **Acoustic signal generation in excised muscle by pulsed proton beam irradiation and the possibility of its clinical application to radiation therapy.** Hayakawa, Yoshinori (Tsukuba Univ., Ibaraki (Japan). Inst. of Basic Medical Science); Tada, Junichiro; Inada, Tetsuo; Kitagawa, Toshio; Wagai, Toshio; Yoshioka, Katsuya. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Jul 1989. (CONF-8901176–: 4. workshop on radiation detectors and their uses, Tsukuba (Japan), 24-25 Jan 1989). In *Radiation detectors and their uses.* Order Number DE90741444. Available from NTIS (US Sales Only), PC A08/MF A01.

Acoustic signals generated in liquids and in metals by pulsed proton beam are thought to be thermal shock wave due to localized energy deposition of incident protons. Thus the intensity of generated acoustic signals is almost proportional to the energy deposited at the region. This suggests the possibility for measuring spatial distribution of energy deposition of proton beam using the acoustic method. In proton beam radiation therapy, treatment planning is developed from data of X-ray computer tomography which reflects the information on the electron density distribution in the patient's body. Ensuring the agreement of the dose distribution in the patient with the planned one, however, is difficult. It is expected that the acoustic method can provide a useful tool for this purpose. The pulsed proton beam of 50ns in pulse width is used for cancer therapy at the University of Tsukuba. A hydrophone is used to detect acoustic signals generated by pulsed proton beam. Detected signals are amplified ten thousand times before being averaged and analyzed by digital oscilloscope. Measurements made suggest that the method could be useful for radiation therapy. (N.K.).

Intercomparison measurements were performed at the MRC Cyclotron, Clatterbridge (U.K.). Discrepancies between the previously stated doses of Hammersmith Hospital, London and the doses measured at NAC (Pretoria) have been resolved with the introduction of a simple correction factor. Spectral energy measurements have been performed in air at SSD and in-phantom for the neutron therapy beam. The average energy E_n of the in-air spectrum together with values for the average kerma ratio $(K_l/K_m)_N$ and the ratio of the average energies required to create an ion pair in the A150/TE gas ionization chamber were determined. Cognizance regarding radiation protection measures has been taken concerning recent ICRP recommendations doubling the quality factor for fast neutrons. Modifications to the safety interlock system of the neutron therapy facility were implemented to allow for the independent use of the kilocurie ^{60}Co radiation unit. 2 figs., 13 refs.

One of the objectives of the National Accelerator Centre is to provide facilities for radiotherapy of cancer patients. It is therefore logical that some scientific effort be directed at the underlying molecular mechanisms involved in carcinogenesis and the effectiveness of particle irradiation on cell survival.

29142 (ORNL/TM–11427) **Nuclear Medicine Program progress report for quarter ending December 31, 1989.** Knapp, F.F. Jr.; Ambrose, K.R.; Callahan, A.P.; McPherson, D.W.; Mirzadeh, S.; Srivastava, P.C.; Allred, J.F.; Hasan, A.; Lambert, C.R.; Lambert, S.J. Oak Ridge National Lab., TN (USA). Apr 1990. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90010249. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In this report the use of a simple colorimetric assay employing the bisthiosemicarbazone (TSC) derivative of phenylglyoxal to evaluate the specific activity of spallation-produced copper-67 (Cu-67) samples is described. Four samples from the Los Alamos National Laboratory (LANL) and one sample from the Brookhaven National Laboratory (BNL) were analyzed and the results compared in a "blind study" with specific activity values obtained by isotope coupling plasma (ICP) analysis at the production sites. A good comparison was found, and these results indicate that the TSC approach is a simple, inexpensive, and rapid technique to determine the specific activity of spallation-produced Cu-67. The synthesis, radioiodination, and evaluation of deiodination in rats in vivo of two new maleimide agents for antibody labeling is also described. 3 figs., 1 tab.

29143 Comparison of different radiation types and irradiation geometries in stereotactic radiosurgery. Phillips, M.H. (Lawrence Berkeley Laboratory, CA (USA)); Frankel, K.A.; Lyman, J.T.; Fabrikant, J.I.; Levy, R.P. *International Journal of Radiation Oncology, Biology and Physics (USA),* 18(1): 211-220 (Jan 1990).

Recent interest in stereotactic radiosurgery of intracranial lesions, and the development of stereotactic irradiation techniques has led to the need for a systematic and complete comparison of these methods. A method for conducting these comparisons is proposed and is applied to a set of currently-used stereotactic radiosurgical techniques. Three-dimensional treatment planning calculations are used to compare dose distributions for several different radiation types and irradiation geometries. Calculations were performed using charged particles (H, He, C, and Ne ions) and the irradiation geometry currently used at Lawrence Berkeley Laboratory. Photons in the Gamma Knife configuration and the Heidelberg Linac arc method are used. The 3-dimensional dose distributions were evaluated by means of dose-volume histograms and integral doses to the target volume and to normal brain. The effects of target volume, shape and location are studied. The charged particle dose distributions are more favorable than those of the photon methods. The differences between charged particles and photons increase with increasing target volume. The differences between different charged particle species are small, as are the effects of target shape and location.

29144 No-carrier-added [1^{11}C]putrescine. McPherson, D.W.; Fowler, J.S.; Wolf, A.P. To Dept. of Energy, Washington, DC. USA Patent 4874600/A/. 17 Oct 1989. Filed date 17 Apr 1986. USA Patent Application 6-853,105. Int. Cl. A61J 49/02. 6p.

This paper describes a radiolabeled imaging agent, no-carrier-added [1^{11}C]putrescine, and the use of this very pure material as a radiotracer with positron emission tomography for imaging brain tumors. The invention relates to the synthesis of no-carrier-added [1^{11}C]putrescine based on the Michael addition of potassium ^{11}C-labeled dinitrile. The method is rapid and efficient and provides radiotracer with a specific activity greater than 1.4 curies per millimol and in a purity greater than 95%.

29145 (DOE/ER/60842–1) **Factors affecting transport of bacterial cells in porous media: Technical progress report.** Mills, A.L.; Herman, J.S.; Hornberger, G.M. Virginia Univ., Charlottesville, VA (USA). Dept. of Environmental Sciences. Mar 1990. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-89ER60842. Order Number DE90009314. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

There are serious deficiencies in our fundamental knowledge of biogeochemical processes associated with the growth and transport of free-living bacteria in geological media. This project utilizes a series of controlled and replicated laboratory experiments to examine and quantify factors influencing the growth and penetration of bacteria in a porous medium. The experimental design is based on response surface methods and investigates the effects of surface chemistry, grain size, bacterial shape and size, motility, propensity for aggregation, solution chemistry and flow characteristics on transport of the bacteria. Auxiliary experiments examine adsorption reactions and other individual responses that may be poorly understood. We have thus far conducted experiments dealing with the breakthrough of bacteria in columns of clean quartz sand and iron oxyhydroxide-coated quartz sand, experiments dealing with the transport of bacteria through porous media containing preferred flow paths, experiments concerning the effect of bacterial cell size on transport and experiments on the effect of the ionic strength of the solution on bacterial transport. Additionally we have begun to evaluate the tendency for free-living vs particle-attached bacteria from deep and shallow subsurface environments to adhere to mineral surfaces due to hydrophobic properties of the cell exterior. This report summarizes the accomplishments and findings of our work to date. 5 figs., 1 tab.

Although increases in development and sales of biotechnology are projected, research on the risks associated with deliberate releases of biotechnology products lags behind. Thus, there is an urgent need to provide investigators and regulators with guidelines for classifying and evaluating risks associated with the release of genetically engineered microorganisms (GEMs). If the release of GEMs into the environmental poses risks similar to that of releasing conventionally altered organisms (CAOs), then a study evaluating the hazards associated with environmentally released CAOs would be most useful. This paper provides a survey of the available data on survival, dispersal, pathogenicity, and other characteristics which affect the fate of microbes after release. Although the present study is not exhaustive, it does provide an indication of the type and amount of data available on CAOs. 350 refs.

This document contains 15 papers. Topics include a review of some California fisheries, spawning biomass of the northern anchovy, marine fisheries, habitat alterations, fishery management, reproduction, population dynamics, acoustic Doppler currents and sea lion interaction and depredation. Each paper will be indexed and entered separately on the energy data base. 54 figs., 29 tabs. (KD)

29148 Evidence from Solanum tuberosum in support of the dual-pathway hypothesis of aromatic biosynthesis. Morris, P.F. (Univ. of Florida, Gainesville (USA)); Doong, R.L.; Jensen, R.A. *Plant Physiology (USA)*, 89(1): 10-14 (Jan 1989). DOE Contract FG05-86ER13581.

Key branchpoint enzymes of aromatic amino acid biosynthesis, 3-deoxy-D-arabino-heptulosonate 7-phosphate synthase (DS) and chorismate mutase (CM), have previously been shown to exist as separate compartmentalized isozymes in the chloroplasts and cytosol of tobacco, sorghum and spinach. Although additional examples of plants containing these isozyme pairs are accumulating, some studies in the literature report the presence of only the single plastidic DS or CM enzyme. Such apparent exceptions contradict the universality of pathway organization existing in higher plants that is implied by the dual-pathway hypothesis of aromatic biosynthesis. Since potato (Solanum tuberosum) exemplifies a case where only a single species of both DS and CM have been reported, we selected this system for further analysis. The DS-Mn and DS-Co isozyme pair, exhibiting all of the differential properties described in Nicotiana silvestris, have now been identified in S. tuberosum. Likwise, partial purification via DEAE-cellulose chromatography revealed two isozymes of CM in disks excised from tubers of S. tuberosum. The differential regulatory properties of these isozymes were comparable to the CM-1 and CM-2 isozymes of N. silvestris.

29149 Intestinal uptake of fluorescent microspheres in young and aged mice (42825). LeFevre, M.E. (Brookhaven National Laboratory, Upton, NY (USA)); Boccio, A.M.; Joel, D.D. *Proceedings of the Society for Experimental Biology and Medicine (USA)*, 190(1): 23-27 (1989).

Rhodamine B-labeled synthetic latex particles (microspheres), 1.8 μm in diameter, were administered by gavage 5 days per week to young (24 days) and aged (18 months) mice. After 25 days (19 gavages), the particles were assayed in solubilized tissues by depositing them of filters and counting under fluorescence microscopy. Aged mice exhibited significantly more fluorescent particle accumulation in Peyer's patches but significantly less in lungs than young mice. Mesenteric lymph nodes and Peyer's patch-free intestinal segments contained measurable latex, but differences between young and aged animals were not significant. Liver contained only trace amounts of latex, and spleen and kidney were latex free in both young and aged animals. Nonquantitative observations on KOH-glycerol-cleared whole Peyer's patches and slices of liver, lung, and mesenteric lymph node were similar.

29150 Effect of water stress on chlorophyll and carotenoid contents on seedlings from three seed sources of Pinus ponderosa. Benes, S.E. (Lawrence Livermore National Lab., CA (USA)); Houpis, J.L.J. *Plant Physiology, Supplement (USA)*, 89(4): 124 (Apr 1989).

The effect of water stress on pigmentation was studied on seedlings from three seed sources of ponderosa pine (Pinus ponderosa Dougl.) selected from similar latitudes but along a gradient of decreasing water availability from the California coast to the western and eastern sides of the Sierra Nevada Mountains. All plants were grown in a common garden for 18 months. Water was withheld from the two-year old potted seedlings and weekly needle samples were taken for the 10 week drought period and for a two week recovery period. Pigments were passively extracted in dimethylformamide and quantified spectrophotometrically. The seedlings from the more mesic seed zone exhibited water stress earlier (Week 8) and to a greater extent (-1.53 Mpa predawn water potential) than seedlings from the other two seed zones. However, chlorophyll and carotenoid concentrations did not correspond to increasing level of water stress. There were differences in pigmentation among the seedlings from the three seed zones, with those seedlings from the west side of the Sierra Nevada having less chlorophyll a and b, and carotenoids than those from the other two regions. Analysis of the chlorophyll a and b, and carotenoids than those from the other two regions. Analysis of the chlorophyll a/b ratio indicated that although there were differences in pigmentation, the relative abundance of chlorophyll a to be was consistent among seedlings from all three seed zones.

29151 Comparative biochemistry of betaine biosynthesis and accumulation in diverse dicot families. McCue, K.F. (Michigan State Univ., East Lansing (USA)); Weretilnyk, E.A.; Bednarek, S.Y.; Hanson, A.D. *Plant Physiology, Supplement (USA),* 89(4): 125 (Apr 1989).

Salt stress elicits betaine accumulation to high levels in species from several diverse dicot families (Chenopodiaceae, Amaranthaceae, Convolvulaceae, Solanaceae, and Asteraceae). FAM-MS studies with deuterated precursors showed that species from all these families synthesize betaine from choline. Enzyme assays and immunotitration data showed that all accumulating species contained betaine aldehyde dehydrogenase (BADH) enzyme activity recognized by antibodies raised against purified BADH isolated from Spinacia oleracea. Immunoblotting indicated that the BADH monomer was in all cases of Mr ≈ 63,000. The similarity of BADH in the different species is consistent with a single evolutionary origin for the betaine pathway. This was supported by the presence in immunoblots of a cross-reacting band at Mr ≈ 63,000 in Magnolia x Soulangiana, a primitive angiosperm.

29152 Physiological indicators of nitrogen response in short-rotation sycamore plantations. Tschaplinski, T.J. (Oak Ridge National Lab., TN (USA)); Norby, R.J. *Plant Physiology, Supplement (USA),* 89(4): 126 (Apr 1989).

American sycamore (Platanus occidentalis L.) seedlings were grown in the field under urea-nitrogen fertilization regimes to identify physiological variables that characterize the growth responses. Treatments included trees fertilized at the beginning of the growing season with 450 kg N/ha, trees fertilized periodically (three times during the growing season) at 37.5 kg N/ha, and unfertilized controls. Above ground biomass accumulation in the heaviest nitrogen treatment was three times that of the controls, and nearly as much growth occurred when less nitrogen was added periodically. Photosynthesis, chlorophyll concentrations, and growth increased rapidly after a midseason application of a small amount of nitrogen, but not to a late-season application. There was no evidence that fertilization extended the physiologically active season or increased susceptibility to drought or cold. Sycamore leaves accumulated sucrose and mannose in response to water and cold stress in all treatments. Photosynthetic pigment concentrations, net photosynthetic rate, and leaf nitrate reductase activity were sensitive indicators of nitrogen fertilization, but foliar concentrations of nitrate, total nitrogen, soluble carbohydrate and soluble protein were not.

29153 Isolation of Arabidopsis mutants with altered seed fatty acid composition. Lemieux, B. (Dept. of Energy, East Lansing, MI (USA)); Browse, J.; Somerville, C. *Plant Physiology, Supplement (USA),* 89(4): 130 (Apr 1989).

By direct screening of Arabidopsis seed fatty acid methyl esters, we have isolated mutants which are deficient in the elongation of 18:1 to 20:1 and the desaturation of 18:2 to 18:3. Both the elongation and the desaturation mutants, designated MB14 and BL1 respectively, have only 10% of the wild-type levels of 20:1 and 18:3 in their seeds. The intermediate levels of 20:1 and 18:3 in F1 seeds of crosses to the wild type indicate that the level of enzyme is regulating the amount of 20:1 and 18:3 in seeds. Consistent with this observation, the mutations were found to segregate 1:2:1 in F2 seeds. We have found that the 18:2 desaturase mutation is clearly expressed in root phosphatidylcholine.

29154 Oligogalacturonides induce flowers in tobacco thin cell layers. Marfa-Riera, V. (Univ. of Georgia, Athens (USA)); Gollin, D.; Mohnen, D.; Darvill, A.; Albersheim, P. *Plant Physiology, Supplement (USA),* 89(4): 141 (Apr 1989).

An optimized tobacco thin-cell-layer (TCL) bioassay was used to study the induction of flowers by plant oligosaccharins. Endopolygalacturonase (EPG)-released fragments of suspension-cultured sycamore cell walls induced flowers on TCLs grown on a medium containing 1.5 μM IBA and 0.9 μM kinetin. The EPG-released fragments were primarily composed of the polysaccharides rhamnogalacturonan I (RG-I), rhamnogalacturonan II (RG-II), and α-1,4-linked oligogalacturonides. The α-1,4-linked oligogalacturonides, subsequently purified from the EPG-released sycamore cell wall fragment mixture, induced flowers on TCLs. Purified RG-I and RG-II did not induce flowers. Oligosaccharide fragments, generated by partial acid hydrolysis of citrus pectin, were also capable of inducing flowers on the TCLs. The active components in the pectin fragment mixture were α-1,4-linked oligogalacturonides. Oligogalacturonides with a degree of polymerization (DP) of 8-16, at concentrations of ≈ 0.1 μM, induced flowers, while oligogalacturonides with a DP 2-7, even at higher concentrations, did not. Oligogalacturonides have previously been shown to induce the synthesis of phytoalexins, protease inhibitors, lignin, and ethylene in other plant systems. Thus, the ability of α-1,4-linked oligogalacturonides to induce flower formation in the tobacco TCLs represents a new biological activity of these oligosaccharins.

29155 Tissue printing on nitrocellulose membrane. Taylor, R. (Washington Univ., St. Louis, MO (USA)); Song, Yanru; Pont-Lezica, R.; Lin, Liangshiou; Ye, Zhenghua; Varner, J.E. *Plant Physiology, Supplement (USA),* 89(4): 141 (Apr 1989).

In the 1950's Daoust developed substrate film printing on gelatin and starch films to localize protease, amylase, DNAase and RNAase activities. These procedures were adapted to plant tissues by Yomo and Taylor (1973) and by Jacobsen and Knox (1973). Membranes such as nitrocellulose bind cellular materials from cut tissue surfaces with little lateral diffusion. Thus accurate chemical prints are obtained. When the tissue is pressed firmly onto nitrocellulose a physical impression is obtained which shows the anatomy of the tissue. We have used the tissue-print technique to localize (1) proteins with labeled antibodies, (2) RNA with labeled nucleic acid probes, (3) enzymes by catalytic activity, (4) glycoproteins by fluorescent lectins, (5) lectins by fluorescent sugars, (6) cysteine-rich proteins by dansylated iodoacetamide, (7) ascorbic acid by silver nitrate, (8) soluble fluorescent compounds by direct observation.

29156 Monoclonal antibodies against plant cell wall polysaccharides. Hahn, M.G. (Univ. of Georgia, Athens (USA)); Bucheli, E.; Darvill, A.; Albersheim, P. *Plant Physiology, Supplement (USA),* 89(4): 141 (Apr 1989).

Monoclonal antibodies (McAbs) are useful tools to probe the structure of plant cell wall polysaccharides and to localize these polysaccharides in plant cells and tissues. Murine McAbs were generated against the pectic polysaccharide, rhamnogalacturonan I (RG-I), isolated from suspension-cultured sycamore cells. The McAbs that were obtained were grouped into three classes based upon their reactivities with a variety of plant polysaccharides and membrane glycoproteins. Eleven McAbs (Class I) recognize epitope(s) that appear to be immunodominant and are found in RG-I from sycamore and maize, citrus pectin, polygalacturonic acid, and membrane glycoproteins from suspension-cultured cells of sycamore, maize, tobacco, parsley, and soybean. A second group of five McAbs (Class II) recognize epitope(s) present in sycamore RG-I, but do not bind to any of the other polysaccharides or glycoproteins recognized by Class I. Lastly, one McAb (Class III) reacts with sycamore RG-I, sycamore and tamarind xyloglucan, and sycamore and rice glucuronoarabinoxylan, but does not bind to maize RG-I, polygalacturonic acid or the plant membrane glycoproteins recognized by Class I. McAbs in Classes II and III are likely to be useful in studies of the structure, biosynthesis and localization of plant cell wall polysaccharides.

29157 Inhibition of foliar gas exchange by ethylene is an ultrasensitive response. Gunderson, C.A. (Oak Ridge National Lab., TN (USA)); Taylor, G.E. Jr. *Plant Physiology, Supplement (USA),* 89(4): 162 (Apr 1989).

The inhibition of foliar gas exchange as a function of ethylene (C_2H_4) concentration was examined to evaluate the potential role of C_2H_4 in mediating gas exchange responses to environmental stress. Net photosynthesis (P_N) and stomatal conductance to H_2O vapor (g_t) were measured in soybean (Glycine max) seedlings after a 4 h exposure to C_2H_4 (0-20 $\mu l\ l^{-1}$) in a controlled environment system. Continuous steady-state measurements of leaflets held at a constant angle to incident light confirmed the magnitude of the maximal response and the time course of response. The declines in gas exchange showed saturation, with half-maximal response at 0.15 $\mu l\ l^{-1}$ for g_s and 0.35 $\mu l\ l^{-1}$ for P_N. Concentration-response curves for both functions were similar to those reported for C_2H_4 binding (in vivo and in vitro) and for hormonally mediated C_2H_4 actions. Kinetic analyses of the saturation patterns using the Hill equation showed both responses to be ultrasensitive, i.e., provide

a relatively large change in gas exchange for a small change in C_2H_4 concentration. The patterns of inhibition of g_s and P_N and the ultrasensitivity of both responses suggest a role for endogenously produced stress C_2H_4 in mediating the responsiveness of foliar gas exchange to many environmental stresses.

29158 Enhanced symbiotic nitrogen fixation with P. syringae pv tabaci. Langston-Unkefer, P.J. (Los Alamos National Lab., NM (USA)); Knight, T.J.; Sengupta-Gopalan, C. *Plant Physiology, Supplement (USA),* 89(4): 179 (Apr 1989).

Infestation of legumes such as alfalfa and soybeans with the plant pathogen Pseudomonas syringae pv. tabaci is accompanied by increased plant growth, nodulation, overall nitrogen fixation, and total assimilated nitrogen. These effects are observed only in plants infested with Tox^+ pathogen; the toxin is tabtoxinine-β-lactam, an active site-directed irreversible inhibitor of glutamine synthetase. The key to the legumes survival of this treatment is the insensitivity of the nodule-specific form of glutamine synthetase to the toxin. As expected, significant changes are observed in ammonia assimilation in these plants. The biochemical and molecular biological consequences of this treatment are being investigated.

29159 Characterization of inositol phosphates in carrot (Daucus carota L.) cells. Rincon, M. (North Carolina State Univ., Raleigh (USA)); Chen, Q.; Boss, W.F. *Plant Physiology (USA),* 89(1): 126-132 (Jan 1989). DOE Contract FG05-87ER13693.

We have shown previously that inositol-1,4,5-trisphosphate (IP_3) stimulates an efflux of $^{45}Ca^{2+}$ from fusogenic carrot protoplasts. In light of these results, we suggested that IP_3 might serve as a second messenger for the mobilization of intracellular Ca^{2+} in higher plant cells. To determine whether or not IP_3 and other inositol phosphates were present in the carrot cells, the cells were labeled with myo-[2-^{3}H]inositol for 18 hours and extracted with ice-cold 10% trichloroacetic acid. The inositol metabolites were separated by anion exchange chromatography and by paper electrophoresis. We found that [^{3}H]inositol metabolites coeluted with inositol bisphosphate (IP_2) and IP_3 when separated by anion exchange chromatography. However, we could not detect IP_2 or IP_3 when the inositol metabolites were analyzed by paper electrophoresis even though the polyphosphoinositides, which are the source of IP_2 and IP_3, were present in these cells. Thus, [^{3}H]inositol metabolites other than IP_2 and IP_3 had coeluted on the anion exchange columns. The data indicate that either IP_3 is rapidly metabolized or that it is not present at a detectable level in the carrot cells.

29160 A developmentally regulated hydroxyproline-rich glycoprotein in maize pericarp cell walls. Hood, E.E. (Washington Univ., St. Louis, MO (USA)); Shen, Q.X.; Varner, J.E. *Plant Physiology (USA),* 87(1): 138-142 (May 1988). DOE Contract FG02-84ER13255.

We have studied the accumulation of peptidyl hydroxyproline in the pericarp of developing maize (Zea mays L., Golden cross Bantam sweet corn) kernels. Although this hydroxyproline accumulates throughout development, it is most soluble and its content per milligram dry weight greatest at midmaturation stages of development. Salt-soluble proteins containing this hydroxyproline from isolated cell walls of developing kernels were fractionated on a CsCl density gradient and on a Chromatofocusing column, resulting in the purification of an hydroxyproline-rich glycoprotein, PC-1. PC-1 is a basic protein of approximately 65 to 70 kilodaltons in molecular weight with an isoelectric point of at least 10.2 and a density of 1.38 to 1.39 in CsCl. Amino acid composition data indicate that it is rich in hydroxyproline, threonine, proline, lysine, and glycine. Its relation to dicot extension is discussed.

29161 Acclimation of photosynthesis to elevated CO_2 in five C_3 species. Sage, R.F. (Univ. of Georgia, Athens (USA)); Sharkey, T.D.; Seemann, J.R. *Plant Physiology (USA),* 89(2): 590-596 (Feb 1989). DOE Contract FG08-84ER13234.

The effect of long-term (weeks to months) CO_2 enhancement on (a) the gas-exchange characteristics, (b) the content and activation state of ribulose-1,5-bisphosphate carboxylase (rubisco), and (c) leaf nitrogen, chlorophyll, and dry weight per area were studied in five C_3 species (Chenopodium album, Phaseolus vulgaris, Solanum tuberosum, Solanum melongena, and Brassica oleracea) grown at CO_2 partial pressures of 300 or 900 to 1000 microbars. Long-term exposure to elevated CO_2 affected the CO_2 response of photosynthesis in one of three ways: (a) the initial slope of the CO_2 response was unaffected, but the photosynthetic rate at high CO_2 increased (S. tuberosum); (b) the initial slope decreased but the CO_2-saturated rate of photosynthesis decreased (B. oleracea, S. melongena). In all five species, growth at high CO_2 increased the extent to which photosynthesis was stimulated following a decrease in the partial pressure of O_2 or an increase in measurement CO_2 above 600 microbars. This stimulation indicates that a limitation on photosynthesis by the capacity to regenerate orthophosphate was reduced or absent after acclimation to high CO_2. Leaf nitrogen per area either increased (S. tuberosum, S. melongena) or was little changed by CO_2 enhancement. The content of rubisco was lower in only two of the fives species, yet its activation state was 19% to 48% lower in all five species following long-term exposure to high CO_2. These results indicate that during growth in CO_2-enriched air, leaf rubisco content remains in excess of that required to support the observed photosynthetic rates.

29162 Isolation and characterization of a starchless mutant of Arabidopsis thaliana (L.) Heynh lacking ADPglucose pyrophosphorylase activity. Lin, Tsanpiao (Michigan State Univ., East Lansing (USA)); Caspar, T.; Somerville, C.; Preiss, J. *Plant Physiology (USA),* 86(4): 1131-1135 (Apr 1988). DOE Contract AC02-76ER01338.

A mutant of Arabidopsis thaliana lacking ADPglucose pyrophosphorylase activity (EC 2.7.7.27) was isolated (from a mutagenized population of plants) by screening for the absence of leaf starch. The mutant grows as vigorously as the wild type in continuous light but more slowly than the wild type in a 12 hours light/12 hours dark photoperiod. Genetic analysis showed that the deficiency of both starch and ADPglucose pyrophosphorylase activity were attributable to a single, nuclear, recessive mutation at a locus designated adg1. The absence of starch in the mutant demonstrates that starch synthesis in the chloroplast is entirely dependent on a pathway involving ADPglucose pyrophosphorylase. Analysis of leaf extracts by two-dimensional polyacrylamide gel electrophoresis followed by Western blotting experiments using antibodies specific for spinach ADPglucose pyrophosphorylase showed that two proteins, present in the wild type, were absent from the mutant. The heterozygous F_1 progeny of a cross between the mutant and wild type had a specific activity of ADP-glucose pyrophosphorylase indistinguishable from the wild type. These observations suggest that the mutation in the adg1 gene in TL25 might affect a regulatory locus.

29163 Role of motility and chemotaxis in efficiency of nodulation by Rhizobium meliloti. Caetano-Anolles, G. (Universidad Nacional de la Plata (Argentina)); Wall, L.G.; De Micheli, A.T.; Macchi, E.M.; Bauer, W.D.; Favelukes, G. *Plant Physiology (USA),* 86(4): 1228-1235 (Apr 1988). DOE Contract FG02-84ER13211.

Spontaneous mutants of Rhizobium meliloti L5-30 defective in motility or chemotaxis were isolated and compared against the parent with respect to symbiotic competence. Each of the mutants were able to generate normal nodules on the host plant alfalfa (Medicago sativa), but had slightly delayed nodule formation, diminished nodulation int he initially susceptible region of the host root, and relatively low representation in nodules following coinoculation with equal numbers of the parent. When inoculated in growth pouches with increasing dosages of the parental strain, the number of nodules formed in the initially susceptible region of the root increased sigmoidally, with an optimum concentration of about 10^5 to 10^6 bacteria/plant. The dose-response behavior of the nonmotile and nonchemotactic mutants was similar, but they required 10- to 30-fold higher concentrations of bacteria to generate the same number of nodules. The distribution frequencies of nodules at different positions along the primary root were very similar for the mutants and parent, indicating that reduced nodulation by the mutants in dose-response experiments probably reflects reduced efficiency of nodule initiation rather than developmentally delayed nodule initiation. The number of bacteria that firmly adsorbed to the host root surface during several hours of incubation was 5- to 20-fold greater for the parent than the mutants.

29164 (DOE/ER/13900–2) **[Structure and expression of nuclear genes encoding rubisco activase]: Progress report.** Zielinski, R.E. Illinois Univ., Urbana, IL (USA). Dept. of Plant Biology. [1990]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER13900. Order Number DE90009310. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Our activities during the past year have centered around two basic aspects of the project: describing more thoroughly the diurnal and light irradiance effects on activase gene expression in barley; and isolating and structurally characterizing cDNA and genomic DNA sequences encoding activase from barley. Three appendices are included that summarize these activities.

29165 (EGG-CEMA–8924) **Assessment of federal databases to evaluate agroecosystem productivity.** Olson, G.L.; Breckenridge, R.P.; Wiersma, G.B. EG and G Idaho, Inc., Idaho Falls, ID (USA). Center for Environmental Monitoring and Assessment. Feb 1990. 39p. Sponsored by Environmental Protection Agency. DOE Contract AC07-76ID01570. Order Number DE90009609. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Ecological monitoring data that could provide indications of agroecosystem condition, such as soil microbial biomass, biodiversity in the patches or mineralizable-N, are not available on a national scale. This paper discusses the economists' and ecologists' approach to assessing agroecosystem productivity, and the data available to make ecological assessments of agroecosystems on a national level. Models and indices of productivity used by ecologists and economists are briefly discussed in the context of agricultural inputs and outputs. Databases on production, pesticides, fertilizers, water use, water and air quality, land use, soil, labor and machinery are evaluated for their ability to make national trend assessments on how this ecosystem responds to stress. 39 refs., 3 figs., 3 tabs.

29166 (JAERI-M–89-197) **Sprout inhibition and change in organic components of potato by gamma-irradiation.** Rahman, M.S. (Institute of Food and Radiation Biology, Dacca (Bangladesh)); Kume, Tamikazu; Ishigaki, Isao. Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1989. 18p. Order Number DE90777721. Available from NTIS (US Sales Only), PC A03/MF A01.

Radiation technology for sprout inhibition and change in organic components of potato by irradiation were investigated. Dose distribution in the package filled with potatoes (depth 45cm, density: 0.56g/cm^3) was measured using Fricke dosimeter. When the package was irradiated at dose rate of 5 x 10^5, 1 x 10^5 and 5 x 10^4 rad/hr, the dose uniformities were calculated as 1.79, 1,45 and 1.35, and the relative throughput capacities were 1.0, 0.26 and 0.14, respectively. After 7 months storage, the sprout of potatoes was not observed at 10 krad irradiation while 57% of potatoes was sprouted at 5 krad. The contents of oxalic and malic acids were slightly increased by irradiation up to 100 krad while that of citric and succinic acids were not changed. The change in contents of these organic acids during storage was almost the same in both unirradiated and irradiated samples. Sucrose content was reached maximum after 8 days in 15 krad irradiated sample while it was increased through 40 days storage in 300 krad irradiated sample. The increase in sucrose contents by irradiation was higher in cortical tissue than in medullary tissue. (author).

29167 (SLU-IMB–40, pp. 152-155) **Cleaning of waste water from a mink fodder factory - an example of a mobile anaerobic filter.** Hagelberg, M. (Bioenergi AB, Ludvika (SE)); Lindow, L. Swedish Univ. of Agriculture, Uppsala (Sweden). Dept. of Microbiology. 1989. (In Swedish). (CONF-8812133–: Conference on the biogas process in the Nordic countries: research and application, Uppsala (Sweden), 6-7 Dec 1988). In *The biogas process in the Nordic countries. Research and Application.* Order Number DE90770812. Available from NTIS (US Sales Only), PC A09/MF A01.

The production volume of fodder for minks varies within a year with peaks during the 4-5 months long period of birthgiving. The fodder is mainly prepared from fish, blood from slaughterhouses and fat. The waste water from the production gives rise to COD of 7-30 g l^{-1}, heavy concentration of suspended solids and a pH between 4.5 and 6. The water flow is around 40 m^3 a day, from which a part is used to test a treatment equipment. The waste water treatment plant is composed of three parts: separation of suspended solids, an 8 m^3 anaerobic filter and a 6 m^3 bio tower in series. After the separation step for solids the COD was reduced to ca. 7 g l^{-1}. The filter was seeded with sewage sludge and the plant was started in August.

29168 (AD-A–216921/7/XAB) **Index of harm: A measure for comparing occupational risk across industries.** Solomon, K.A.; Alesch, K.A. Rand Corp., Santa Monica, CA (USA). Mar 1988. 43p. (RAND/P–7405). Available from NTIS, PC A03/MF A01.

This paper presents an index of harm methodology that compares occupational risk among workers exposed to radiological and nonradiological harms. It extends the work of the International Commission on Radiological Protection (ICRP) by considering American rather than European and Japanese industry groups, by treating the relative importance of various occupational harms as a parameter rather than an arbitrary constant, and by identifying several ways in which both the methodology and the database could be improved. In the analysis, we examine the risk affects of six occupational harms-three nonradiological (death, accidental injury, and disease or illness) and three radiological (somatic effects, genetic effects, and somatic effects to the fetuses or embryos of pregnant women). We performed our analysis under five different assumptions about the relative importance of averting of the six harms in question. The results of this analysis show that radiological workers exposed to the current industry average of 0.35 rem/yr are among the safest of all industry groupings, and the riskiest industries appear to be mining; agriculture, fishing, and farming; construction; transportation; and manufacturing, roughly in that order.

29169 (AD-A–216984/5/XAB) **Air Transport of Radiation (ATR) code: Development and testing of ATR5. Technical report, 5 April 1985-30 March 1988.** Dolatshahi, F.; Kaul, D.C.; Phillips, J.; Roberts, J.A. Science Applications International Corp., San Diego, CA (USA). 2 Jan 1990. 162p. (SAIC–88/3009). Available from NTIS, PC A08/MF A01.

The Air Transport of Radiation (ATR) code is the standard model for initial radiation dose (kerma free-in-air) from nuclear weapons in uniform air and air-over ground geometries. ATR predicts free field dose from neutron, gamma rays, from a parameterized data base. This report describes modifications made to the code to provide for improved uniform air and air-over-ground dose distributions. Effects of atmospheric moisture are now accounted for. The fission product radiation model has been modified to include contributions from individual fissile isotopes and has been provided with empirical corrections to allow it to better replicate observed dose values. The resulting version of the code is ATR5.

29170 (CONF-900608–4) **Investigation of radiation effects in Hiroshima and Nagasaki using a general Monte Carlo-discrete ordinates coupling scheme.** Cramer, S.N.; Slater, C.O. Nucleo de Estudos e Pesquisas Cientificas do Rio de Janeiro, RJ (Brazil). [1990]. 8p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. From American Nuclear Society annual meeting; Nashville, TN (USA); 10-15 Jun 1990. Order Number DE90005273. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A general adjoint Monte Carlo-forward discrete ordinates radiation transport calculational scheme has been created to study effects of the radiation environment in Hiroshima and Nagasaki due to the bombing of these two cities. Three principal areas of investigation are: (1) to determine by experiment and calculation the neutron and gamma-ray energy and angular spectra and total yield of the two weapons, (2) using these weapon descriptions as source terms, to compute radiation effects at several locations in the two cities for comparison with experimental data collected at various times after the bombings and thus validate the source terms, and (3) to compute radiation fields at the known locations of fatalities and surviving individuals at the time of the bombings and thus establish an absolute cause-and-effect relationship between the radiation received and the resulting injuries to these individuals and any of their descendants as indicated by their medical records. 5 refs., 2 figs.

29171 (CONF-8904186–2) **Recent Increases in Bromus populations on the Nevada Test Site.** Hunter, R. Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (USA). Environment and Health Div. [1989]. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-89NV10630. From Wildland shrub symposium; Las Vegas, NV (USA); 5 Apr 1989. Order Number DE90009417. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Two introduced grass species, Bromus rubens L. and Bromus tectorum L., have invaded the Mojave and Great Basin Desert vegetation of the Nevada Test Site. One or the other dominates most ephemeral populations. They occur in densities up to thousands per square meter. The ecosystem changes resulting from the grasses include an increased tendency for propagation of fire and a possible decrease in diversity of the native ephemeral flora. 14 refs., 4 tabs.

29172 (DOE/EH–0149T) **A technical review and assessment of the BEIR V [Biological Effects of Ionizing Radiation V] report.** USDOE Assistant Secretary for Environment, Safety and Health, Washington, DC (USA). Mar 1990. 59p. Sponsored by U.S. DOE Environment Health & Safety. Order Number DE90010232. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

This report was prepared by the DOE BEIR V Technical Review Committee (TRC) to provide a technical review and assessment of the National Research Council's Bilogical Effects of Ionizing Radiation (BEIR) Committee's Report entitled "Health Effects of Exposure to Low Levels of Ionizing Radiation" (BEIR V). This report contains seven sections. The first section serves as an introduction and reviews the charge to the TRC. The second section is a chapter-by- chapter summary of the BEIR V Report. The third section is a summary of the risk estimates and conclusions of the BEIR V Committee for genetic effects, cancer induction, and in utero effects. The fourth section is a summary and analysis of the new scientific information used by the BEIR V Committee in developing its risk recommendations and conclusions. The fifth section is an assessment of the scientific information and methods used by the BEIR V Committee in developing their risk estimates and conclusions and an analysis of the key assumptions underlying the use of these risk estimates in risk assessment. The sixth section is the TRC'S assessment of the regulatory implications of the BEIR V risk estimates and conclusions for DOE nuclear operations. The seventh and final section is the TRC'S recommended actions for DOE's consideration concerning the BEIR V Report risk estimates and conclusions. 23 refs., 5 tabs.

29173 (DOE/ER–0451P) **A critical review of measurements of the "unattached" fraction of the radon decay products: Radon technical report series.** Hopke, P.K. Clarkson Coll. of Tech., Potsdam, NY (USA). Dept. of Chemistry. Jan 1990. 65p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER60876. Order Number DE90010157. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Exposure to radon and its decay products is known to cause lung cancer. It is the deposition of the decay products within the respiratory tract that delivers the dose leading to adverse health effects. An important concept in understanding the health effects of the radon progeny is the "unattached" fraction. It was suggested that there is a highly diffusive form of the radon and thoron decay products that can be fully deposited in the respiratory system referred to as the "unattached fraction." Initial measurements were made using diffusional deposition in tubes to separate the high diffusivity "unattached" activity from that associated with lower diffusion coefficient particles. Subsequently, wire screens were used to estimate "unattached" Rn daughter fractions in ambient and mine atmospheres. Wire screen penetration theory along with a semi-empirically corrected diffusion coefficient equation can be used to characterize the previously reported "unattached" fraction measurements. Collection efficiency curves have been estimated for previously published wire screen "unattached" fraction measurements and the measurements available in the literature are reviewed and discussed. The purpose for measuring unattached fraction is to estimate the dose to the respiratory tract arising from the deposition of radon decay products to which the individual is exposed. Therefore, if measurements could be made in a manner that better reflected the aerodynamic behavior of the radon progeny in the respiratory tract, then the assessment of exposure could be directly related to dose with far greater accuracy. Respiratory deposition models can serve as basis for such a system and the design concepts of such a measurement system is presented. 104 refs., 34 figs., 7 tabs.

29174 (EGG-BNCT–8777) **Power Burst Facility/Boron Neutron Capture Therapy Program for cancer treatment: Bulletin, Volume 4, No. 1.** Dorn, R.V. III. EG and G Idaho, Inc., Idaho Falls, ID (USA). Jan 1990. 38p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE90009776. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Highlights of the PBF/BNCT Program during January 1990 include progress within the areas of: gross boron analysis in tissue, blood, and urine; analytical methodologies development for BSH purity determination; noninvasive boron quantitative determination; dosimetry; analytical radiation transport and interaction modeling for BNCT; large animal model studies; neutron source and facility preparation; administration and common support; and PBF operations.

29175 (INIS-SU–164) **1. All-union conference on radiobiology. Vol. 1: Summaries of reports.** AN SSSR, Moscow (USSR). 1989. 253p. (In Russian). (CONF-8908223–: 1. All-Union conference on radiobiology, Moscow (USSR), 21-27 Aug 1989). Order Number DE90706080. Available from NTIS (US Sales Only), PC A12/MF A01; OSTI; INIS.

Individual papers are processed separately for the data base. (DLC)

29176 (KFK–3908) **Calculated distributions of absorbed dose from π^- leaving a magnetic irradiation channel compared to data from experiments.** Hilgendorff, H. Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Inst. fuer Kernphysik; Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Physik. Mar 1985. 53p. (In German). Order Number DE90780366. Available from NTIS (US Sales Only), PC A04/MF A01.

Using the computer program named PIONDOSE transport calculations were carried out for π^--mesons decelerated within a water phantom. The particle beam parameters are those of the biomedical facility of the Swiss Institute for Nuclear Research (SIN) at Villigen/Aargau. The present paper describes the characteristics of a single beam channel and presents the resulting energy distributions in kind of depth dose curves, energy deposition spectra and isodose contours. The calculated dose distributions are faced to measured isodose contours and are found to be in good agreement with each other. Distributions of dose in lineal energy and in contributions from various secondary particles complete the information from experimental dosimetry. (orig.).

29177 (NAC-AR–86-01, pp. 181-187) **The Pretoria cyclotron facility: Radiobiology.** National Accelerator Centre, Faure (South Africa). 1986. In *Annual report June 1986.* Order Number DE90624865. Available from NTIS (US Sales Only), PC A13/MF A01; OSTI; INIS.

A technique was developed to decrease significantly the experimental uncertainties related to cell survival data. This technique, single cell mapping, was applied in the low-dose region (1 - 3 Gy) to determine neutron and photon OER values from which the HGF

could be be calculated. Using chromosome aberrations as a biological endpoint, the dicentric frequency was determined as a function of dose in both neutron and photon fields. This study will eventuate in an investigation of synergistic effects in mixed n-γ radiation fields. The mean inactivation dose concept was empirically tested to assess its value in the analysis of survival data and for intercomparison studies. 5 figs., 2 tabs., 5 refs.

29178 (NCRP–106) **Limit for exposure to "hot particles" on the skin.** National Council on Radiation Protection and Measurements, Bethesda, MD (USA). c 31 Dec 1989. 54p. Sponsored by National Council on Radiation Protection and Measurements. Available from National Council on Radiation Protection and Measurements Publications, 7910 Woodmont Avenue, Suite 800, Bethesda, MD 20814.

This report reviews the radiobiological effects of hot particles on the skin and recommends a limit on the product of their beta-particle emission rate and duration of exposure. For the end points addressed by this report, beta particles are the radiation of concern. Relative to the beta particle dose, the gamma radiation associated with a beta-emitting hot particle on the skin does not contribute significantly to the tissue dose in the vicinity of the particle. For the purpose of this report, a hot particle is arbitrarily considered to be a discrete radioactive fragment that is insoluble in water and is no larger than approximately 1 mm in any dimension. In addition, only hot particles directly on the skin are considered in this report. 53 refs., 5 figs., 2 tabs.

29179 (OEFZS–4515) **Cs-137 soil to plant transfer factors derived from pot experiments and field studies.** Horak, O. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H. (Austria). Inst. fuer Landwirtschaft); Gerzabek, M.H.; Mueck, K. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Nov 1989. 13p. (LA–224/89;ST–173/89). Order Number DE90624599. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Soil to plant transfer factors (TF) of ^{137}Cs for different crop plants were determined in pot experiments, in outdoor experiments with plastic containers of 50 l volume, and in field studies. In all cases the soil contamination with ^{137}Cs resulted from fallout after the Chernobyl reactor accident. Mean TF derived for outdoor plants on a fresh weight basis, ranged from 0,0017 (leaf vegetables) to 0,059 (rye straw) and showed characteristic differences depending on plant part and species. Generally, for fruits and potato tubers a lower TF was found than for vegetative plant parts. Moreover, the data were compared with those from former experiments, carried out before the Chernobyl accident. There is a good agreement for cereals (with exception of rye) fruit vegetables and fodder crops, while actual TF are substantially lower for potatoes, leaf and root vegetables, but higher for rye. A significant negative correlation was observed between the TF and the soil activity concentrations for ^{137}Cs. In container experiments the TF were found to be influenced mainly by the clay content of the soil. 11 refs., 2 figs., 2 tabs. (Authors).

29180 (ORNL/FTR–3567) **[Application of dosimetry system DS86 to individual A-bomb survivors]: Foreign trip report, March 7–29, 1990.** Kerr, G. Oak Ridge National Lab., TN (USA). 6 Apr 1990. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90009868. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler visited the Radiation Effects Research Foundation (RERF) from March 9 to March 28, 1990. The purpose of this visit was to begin preparation of a report that describes the application of a new dosimetry system (DS86) to individual A-bomb survivors. Such a report is vital to future work of both national and international committees dealing with the health risks of radiation exposure. The traveler, who recently spent a year working at RERF in Hiroshima, will prepare this report in collaboration with the RERF staff. 12 refs.

29181 (ORNL/TM–11424) **A survey of radial growth trends in spruce in the Great Smoky Mountains National Park as influenced by topography, age, and stand development.** Adams, H.S. (Dabney S. Lancaster Community Coll., Clifton Forge, VA (USA)); McLaughlin, S.B.; Blasing, T.J.; Duvick, D.N. Oak Ridge National Lab., TN (USA). Feb 1990. 69p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90007992. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Environmental Sciences Division Publication No. 3427.

A survey of red spruce growth trends at several sites in the Great Smoky Mountains National Park (GSMNP) was undertaken to determine the relationship of the magnitude and timing of changes in annual radial increment to elevation, aspect, tree age, mortality, and competitive status. The growth changes observed suggest responses to changes in climate (principally temperature) or atmospheric pollution acting individually or, more likely, in combination. Major emphasis on these potential causes is warranted in future studies. 56 refs., 8 figs., 11 tabs.

29182 (PNL-SA–17384-HEDR) **Statistical aspects of reconstructing the ^{131}I dose to the thyroid of individuals living near the Hanford Site in the mid-1940s.** Gilbert, R.O.; Napier, B.A.; Liebetrau, A.M.; Haerer, H.A. Pacific Northwest Lab., Richland, WA (USA). Apr 1990. 9p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-900438–1: Workshop on statistics of human exposure to ionizing radiation, Oxford (UK), 2-4 Apr 1990). Order Number DE90009449. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

In 1988 the Hanford Environmental Dose Reconstruction Project was established to estimate (reconstruct) potential doses that may have been received by individuals from radionuclides emitted with air and water effluents from the Hanford Site in southeastern Washington State, USA, since 1944. This paper discusses some of the statistical methods being developed to assess the uncertainty in reconstructed doses to the thyroid from ^{131}I via the air-pasture-cow-milk-human pathway in the 1944–47 period. Emphasis is placed on assessing dose uncertainties that arise from uncertainties in specification of model parameters. 7 refs.

29183 (SIS–1989:3) **Studies of cellular damage induced by X-rays and visible light: Methods and preliminary studies.** Christensen, T.; Kinn, G.; Reitan, J.B. Statens Inst. for Straalehygiene, Oslo (Norway). 1989. 22p. (In Norwegian). Order Number DE90624533. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

DNA-damage in cells has been studied by use of spectrophotometry and fluorometry. The method is based on the differential fluorescence quantum yield of the fluorochrome Hoechst 33258 when bound to single and double stranded DNA, respectively. DNA-damage by doses of X-rays below 2 Gy was clearly detectable. Blue light from phototherapy lamps induced DNA-damage in human TMG-1 glioblastoma, but no significant effect could be observed after irradiation with green lamps. In the presence of bilirubin the amount of DNA-damage was increased, notably at high bilirubin concentration and by blue light. 9 refs; 12 figs.

29184 Comparison of radium-induced and natural bone sarcomas by histological type, subject age and site of occurrence. Schlenker, R.A. (Argonne National Lab., IL (USA)); Keane, A.T.; Unni, K.K. pp. 188 of Risks from radium and Thorotrast: Proceedings of a workshop held at Bethesda, Maryland, USA from 3 to 5 October 1988 and sponsored by the US National Cancer Institute, the Radiation Protection Programme of The Commission of The European Communities and the US Department of Energy. Taylor, D.M.; Mays, C.W.; Gerber, G.B.; Th. British Institute of Radiology, London (UK) (1989). (CONF-8810248–: ; EUR–12088).

The distributions by histological type, age and anatomical location of 41 bone sarcomas occurring among radium-exposed female dial painters are compared with those for 401 tumours occurring naturally among males and females. No statistically significant differences are found. There is a deficit of bone sarcomas in the axial skeleton compared with the appendicular skeleton and at some sites with large bone surface area, such as the spine, where an abundance of tumours would be expected because of the known positive correlation between tumour frequency and surface area in the major limb bones. The anatomical distribution of radium-induced tumours is not correlated with the distribution of radiation dose nor does it appear to be correlated with the distribution of bone mass or bone surface area throughout the skeleton. (author).

29185 Central nervous system tumours and related intracranial pathologies in radium dial workers. Stebbings, J.H. (Argonne National Lab., IL (USA)); Semkiw, W. pp. 188 of Risks from radium and Thorotrast: Proceedings of a workshop held at Bethesda, Maryland, USA from 3 to 5 October 1988 and sponsored by the US National Cancer Institute, the Radiation Protection Programme of The Commission of The European Communities and the US Department of Energy. Taylor, D.M.; Mays, C.W.; Gerber, G.B.; Th. British Institute of Radiology, London (UK) (1989). (CONF-8810248–: ; EUR–12088).

Among female radiation workers in the radium dial industry there is no overall excess of fatal brain or central nervous system tumours. A significant excess did appear, in one of three major cohorts; the excess was not due to an excess of gliomas and cannot be ascribed with certainty to radium or external radiation. A significant proportional excess of tumours outside of the brain was observed, consistent with irradiation of nervous system tissue from adjacent bone. Excess tumours of the eye, pituitary or pineal did not occur. Early deaths from brain abscess or mastoiditis, coded as diseases of the nervous system and sense organs, were observed. (author).

29186 External radiation doses received by female radium dial painters. Rowland, R.E. (Argonne National Lab., IL (USA)); Lucas, H.F.; Schlenker, R.A. pp. 188 of Risks from radium and Thorotrast: Proceedings of a workshop held at Bethesda, Maryland, USA from 3 to 5 October 1988 and sponsored by the US National Cancer Institute, the Radiation Protection Programme of The Commission of The European Communities and the US Department of Energy. Taylor, D.M.; Mays, C.W.; Gerber, G.B.; Th. British Institute of Radiology, London (UK) (1989). (CONF-8810248–: ; EUR–12088).

It is the purpose of this study to estimate the external dose in the work place, to determine the dose received from these external sources for each female dial painter from the length of time she worked, and to examine the relationship between external dose and the causes of death. (author).

29187 Eye changes induced by radium. Taylor, G.N. (Utah Univ., Salt Lake City, UT (USA). School of Medicine); Lloyd, R.D.; Shabestari, L.; Angus, W.; Mays, C.W.; Muggenburg, B.A. pp. 188 of Risks from radium and Thorotrast: Proceedings of a workshop held at Bethesda, Maryland, USA from 3 to 5 October 1988 and sponsored by the US National Cancer Institute, the Radiation Protection Programme of The Commission of The European Communities and the US Department of Energy. Taylor, D.M.; Mays, C.W.; Gerber, G.B.; Th. British Institute of Radiology, London (UK) (1989). (CONF-8810248–: ; EUR–12088).

Radium-induced intraocular neoplasia has not been reported in people, nor were the intraocular pigmentary changes observed in the beagles described in the dial painters or the radium 226 iatrogenic cases. However, Spiess (1969) has observed a 25% incidence of multiple pigmented naevi in the iris of the radium 224 German cases and Stefani, Spiess and Mays (1986) have noted an abnormal incidence of cataracts in this same group of patients. The reasons for the absence of the much less severe radium-induced eye changes in man as compared to the dog has not been determined. Reference is also made to the authors radium 226 rodent studies with mouse strain onychomys leucogaster. (author).

29188 High linear energy transfer radiation and space missions. Fry, R.J.M. (Oak Ridge National Lab., TN (USA)). pp. 188 of Risks from radium and Thorotrast: Proceedings of a workshop held at Bethesda, Maryland, USA from 3 to 5 October 1988 and sponsored by the US National Cancer Institute, the Radiation Protection Programme of The Commission of The European Communities and the US Department of Energy. Taylor, D.M.; Mays, C.W.; Gerber, G.B.; Th. British Institute of Radiology, London (UK) (1989). (CONF-8810248–: ; EUR–12088).

The radiation environments in space are less benign than on earth. The estimate of radiation hazards and the setting of acceptable exposure limits for missions in low-earth orbits appears to be straightforward. In contrast, the estimation of the radiation risks involved in the exploration of deep space is much more difficult. Not enough is known about biological effects of HZE particles and the prediction of solar particle events and the prediction of solar particle events lacks precision. (author).

29189 The influence of non-uniform α-irradiation of Chinese hamster liver on chromosome damage and the induction of cancer. Guilmette, R.A. (Lovelace Inhalation Toxicology Research Inst., Albuquerque, NM (USA)); Gillett, N.A.; Eidson, A.F.; Griffith, W.C.; Brooks, A.L. pp. 188 of Risks from radium and Thorotrast: Proceedings of a workshop held at Bethesda, Maryland, USA from 3 to 5 October 1988 and sponsored by the US National Cancer Institute, the Radiation Protection Programme of The Commission of The European Communities and the US Department of Energy. Taylor, D.M.; Mays, C.W.; Gerber, G.B.; Th. British Institute of Radiology, London (UK) (1989). (CONF-8810248–: ; EUR–12088).

In this study, Chinese hamsters received intravenous injections of Thorotrast (7.4, 1.5 or 0.30 Bq/g body weight) or monomeric ^{239}Pu citrate (7.4 Bq/g), and were either sacrificed for cytogenetic analysis or held for lifespan dose-response observation. The frequency of chromosome aberrations observed in the Thorotrast-exposed animals was 0.47 aberrations/cell Gy, a frequency similar to that in ^{239}Pu citrate-injected hamsters. Using Cox proportional hazards analysis of the dose-response for several neoplastic and hyperplastic lesions observed in the liver, it was found that the relative risk for each endpoint was increased in a dose-related manner for all three dose levels of Thorotrast, and that risks for the plutonium-injected animals (7.4 Bq/g) were similar to those of the hamsters injected with 1.5 Bq/g Thorotrast. (author).

29190 Multiple components of split-dose repair in plateau-phase mammalian cells: A new challenge for phenomenological modelers. Nelson, J.M. (Pacific Northwest Laboratory, Richland, WA (USA)); Braby, L.A.; Metting, N.F.; Roesch, W.C. *Radiation Research (USA),* 121(2): 154-160 (Feb 1990).

Split-dose experiments using starved plateau-phase Chinese hamster ovary cells have been used to investigate the kinetics of repair, expressed in terms of enhancement of reproductive survival. The results show two distinct components of repair, one having a characteristic time of just over 1 h for the removal of a lesion, the other, about 18 h. The rate at which each component removes damage and the fraction of the total damage that each removes appear to be independent of the initial amount of damage produced, i.e., dose. This lack of dose dependence is not consistent with some simple models of ionizing radiation damage and repair, such as those which assume that saturation of a repair process, depletion of enzyme pools, or the interaction of pairs of sublesions is responsible for the curvature in the dose-response relationship. However, the relationship between the amounts of each type of damage and dose appears to be consistent with models that assume that only a portion of the initial damage is directly accessible to the repair systems or that the initial damage consists of a mixture of potentially lethal and sublethal lesions.

29191 Production of DNA strand breaks by direct effects of heavy charged particles. Holley, W.R. (Lawrence Berkeley Laboratory, Berkeley (USA)); Chatterjee, A.; Magee, J.L. *Radiation Research (USA),* 121(2): 161-168 (Feb 1990).

A theoretical model has been developed to calculate the yields of single- and double-strand breaks in DNA induced by direct effects of ionizing radiation. In this model, which involves no fitted parameters, elements of track structure and stopping power theory are combined with a detailed geometrical description of DNA to calculate the energy deposited by fast charged particles to DNA molecules. The average energy per interaction with a DNA molecule is estimated to be 30 eV from the available data on oscillator strength measurements. These ideas have been incorporated in a Monte Carlo computer program using Poisson statistics to treat the stochastic nature of the energy deposition processes and thereby determine the excitation and ionization states of the molecule. Each ionization reaction on the DNA backbone is assumed to lead to a DNA strand break. In our model double-strand breaks result from nearby independent breaks on opposite strands. Our calculated single- and double-strand break yields compare well with measured cellular data under conditions such that direct effects are thought to dominate strand break production.

29192 Scanning electron microscopy of lung following alpha irradiation. Sanders, C.L. (Pacific Northwest Laboratory, Richland, WA (USA)); Lauhala, K.E.; McDonald, K.E. *Scanning Microscopy (USA)*, 3(3): 907-917; discussion 918 (Sep 1989).

Pulmonary aggregation of inhaled $^{239}PuO_2$ particles leads to a cellular evolution of focal inflammation, fibrosis, epithelial dysplasia and lung tumor formation. Female Wistar rats were exposed to an aerosol of high-fired $^{239}PuO_2$ (initial lung burden, 3.9 kBq) and the lungs examined at intervals from 1 day to 700 days after exposure by light and scanning electron microscopy and autoradiography. Peribronchiolar Pu particle aggregation increased with time, resulting in well-defined focal inflammatory lesions after 120 days and fibrotic lesions after 180 days. A generalized hypertrophy and hyperplasia of nonciliated bronchiolar cells was seen at 15 days and type II cell hyperplasia by 30 days after exposure. Focal dysplastic changes in type II alveolar epithelium and terminal nonciliated bronchiolar epithelium preceded carcinoma formation. Alveolar bronchiolarization was first noted at 120 days, squamous metaplasia at 210 days, squamous carcinoma at 270 days and adenocarcinoma at 600 days after exposure.

29193 (AD-A-216819/3/XAB) **Mechanisms of cellular membrane effects of TCDD, selected perfluorinated acids, and polyhalogenated aromatic hydrocarbons. Forecast report.** Rogers-Back, A. Microbiological Associates, Bethesda, MD (USA). 1 Feb 1985. 8p. Available from NTIS, PC A02/MF A01.

The first six months of the contract have been devoted to examining the effects of perfluorinated acids and polyhalogenated aromatic hydrocarbons on the colony-forming ability of L5178Y cells. Two subclones of this cell line have been utilized. One subclone is designated L5178Y TK+/. The two cell lines differ markedly in their growth characteristics. L5178Y TK+/- cells tend to associate in clumps of cells and are grown in a shaker incubator to produce better cell suspensions. L5178Y TK+/+ cells grow as a single cell suspension without agitation. The toxic response of both cell lines after treatment with the perfluorinated acids (perfluoro-n-decanoic acid) was measured. In summary, the results for the perfluorinated acids with chain length of 9 or 10 indicate that there is some dissociation of colony growth from suspension growth. Medium type does not affect the toxicity. This would imply that these perfluorinated acids are producing toxicity through a membrane interaction. The dissociation appears to occur in the TK+/+ cells at concentrations approximately 20 higher than those previously reported.

29194 (DFVLR-FB-89-07) **Signature analysis and classification results of pine of different vitality classes using airborne thematic mapper data.** Herrmann, K. (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt e.V. (DLR), Wessling (Germany, F.R.). Inst. fuer Optoelektronik). Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Koeln (Germany, F.R.); Muenchen Univ. (Germany, F.R.). Forstwissenschaftliche Fakultaet. 1989. 189p. (In German). Order Number DE90773660. Available from NTIS (US Sales Only), PC A09/MF A01.

Aim of the investigations was to gain more informations about reflection properties of pines (Pinus sylvestris) with special regard to damage symptoms. Remote sensing was carried through by aerial monitoring with multispectral scanners. The results are discussed and are well corresponding with the results of terrestrial investigations. (KG) With 98 figs., 38 tabs., 136 refs.

29195 (DGMK-400-6) **Guidelines for safe handling of marine fuels.** Jungen, H. Deutsche Wissenschaftliche Gesellschaft fuer Erdoel, Erdgas und Kohle e.V., Hamburg (Germany, F.R.). Jul 1988. 28p. (In German). Available from Deutsche Wissenschaftliche Gesellschaft fuer Erdoel, Erdgas und Kohle e.V., Hamburg (Germany, F.R.).

When properly used for their intended purpose and with good standards of personal and occupational hygiene, marine fuels are unlikely to present a short or long term health risk, given the closed systems under which they are normally stored, handled and consumed. However, where good standards are not maintained, health hazards can arise. This report advises end users of marine fuels of the potential hazards, the recommended precautions for safe handling and use, and on first aid treatment for accidental exposure. (orig.).

29196 (DOE/ER-0450T) **Effects of air temperature on atmospheric CO_2-plant growth relationships.** Allen, S.G. (Agricultural Research Service, Phoenix, AZ (USA). Water Conservation Lab.); Idson, S.B.; Kimball, B.A.; Baker, J.T.; Allen, L.H. Jr.; Mauney, J.R.; Radin, J.W.; Anderson, M.G. Agricultural Research Service, Phoenix, AZ (USA). Water Conservation Lab.; Agricultural Research Service, Gainesville, FL (USA); Western Cotton Research Lab., Phoenix, AZ (USA); Florida Univ., Gainesville, FL (USA); Arizona State Univ., Tempe, AZ (USA). The carbon dioxide concentration of the earth's atmosphere is increasing and expected to double some time during the middle of the next century. In addition, climate models predict that due to the "greenhouse effect", increased atmospheric CO_2 may cause a warming of the earth's surface of 1.5 to 4.5°C. The separate effects of atmospheric CO_2 concentration and temperature on plant processes has been studied extensively. In general, a doubling of CO_2 results in about a one-third increase in productivity of C_3 plants, although a wide range of responses have been reported. This report reviews research concerned with the CO_2 by temperature interaction effects on plants, with an emphasis on experiments conducted in outdoor, CO_2-enriched environments. 102 refs., 28 figs., 4 tabs.

29197 (EPRI-EN-6785) **Sulfur dioxide and ozone effects on crops: Final report.** Amundson, R.G. (Cornell Univ., Ithaca, NY (USA)); Kress, L. Electric Power Research Inst., Palo Alto, CA (USA); Boyce Thompson Inst. for Plant Research, Ithaca, NY (USA); Forest Service, Research Triangle Park, NC (USA). c Apr 1990. 164p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

In order to determine if exposure to O_3 and SO_2 in combination produce greater-than-additive effects on yields of economically important crops, corn, wheat, soybean, alfalfa, and a mixed forage crop of timothy and red clover were exposed to SO_2 and O_3 using open-top chambers in six separate experiments during three field seasons. In five of the six studies changes in physiology and/or growth were also assessed to help determine short-term responses of the plants to the exposures. Monitoring of several physiological responses of the crops provided a means of assessing short term effects of the SO_2 exposures on the crops and helped in interpretation of the effects on yields. 4 refs., 46 figs., 49 tabs.

29198 (GSF-6/89) **1st PBWU status seminar on forest decline. Proceedings.** Reuther, M.; Kirchner, M. (eds.). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. 517p. (In German). (CONF-8902175--: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). Order Number DE90773485. Available from NTIS (US Sales Only), PC A22/MF A01.

The conference was to provide a status report on forest decline research carried out by the PBWU on behalf of the Bavarian State Minister for Regional Development and Environmental Affairs. Forest decline research in Bavaria focuses on certain aspects of the problem and on certain regions. Regional sites of interdisciplinary research are located in the Fichtelgebirge mountains, Bayerischer Wald mountains, the 'Hoeglwald' forest between Munich and Augsburg, and the 'Wank' forest near Garmisch-Partenkirchen. After some general lectures, these sites were discussed one by one at the meeting and are discussed here in the same order. As the PBWU are only part of the total activities in each field, each section of this volume starts with a survey paper and papers refering to non-PBWU activities have been included in order to obtain a

comprehensive picture. Separate records are available in this database for 36 papers of this seminar. (orig./MG).

29199 (GSF–6/89, pp. 5-19) **Forest decline research at the Bavarian Forest National Park.** Knorr, A. (Bayerische Forstliche Versuchs- und Forschungsanstalt, Muenchen (Germany, F.R.)). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

The foundation of the National Park trigged a wide array of hydrological, climatical, floristical and hydrogeological field studies. The sampled data proved to be an important basis for the forest decline research in providing excellent information for properly selecting and equipping of experimental sites to be installed in other areas on one hand and for appropriate interpretation of obtained results on the other. Numerous interdisciplinary research projects are installed at the same experimental site, thus allowing interpretation from various fields of work. The following paragraph lists focal points of research work: Survey and documentation of forest decline by ground based and aerial determination as well as through bioindicators, soil tests in forest stands with various damage stages, studies of increment, annual ring- and crownstructure in forest stands with various damage stages, inquiries about dry and wet inputs, internal nutrient cycle and outputs by runoff and percolating water of forest stands, measurements on concentration and shifts of air pollutants within the canopy, studies of plant physiology. (orig.).

29200 (GSF–6/89, pp. 51-60) **Metabolic studies in a Norway spruce stand (Picea abies Karst.) in the high mountain region of Eastern Bavaria.** Kreutzer, K. (Muenchen Univ. (Germany, F.R.). Lehrstuhl fuer Bodenkunde); Heil, K. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). Available from NTIS (US Sales Only), PC A23/MF A01.

Water and matter fluxes in a Norway spruce stand on podsol at high elevation (1203 m) in East Bavaria were investigated in 1987 and 1988. Water turnover is characterized by annual precipitations of 1700 to 1900 mm, causing seepage of around 1300 to 1600 mm. Total concentration of ions in seepage water at 60 cm depth is 400 to 500 μmol IE L^{-1} with Al^{3+} as dominating cation (300 to 350 μmol IE L^{-1}) and SO_4^{2-} ($\simeq$ 200 μmol IE L^{-1}) and NO_3^- (130 to 270 μmol IE L^{-1}) as dominating anions. In the soil solution the mean molar ratios of Ca/Al resp. Mg/Al are 0.19 resp. 0.10. The strong aluminium mobilization seems to be related to acidic deposition from the atmosphere (2.2 to 2.6 kmol proton input ha^{-1} a^{-1}) and to soil internal proton production by surplus nitrification (1 to 3 kmol ha^{-1} a^{-1}). The intensity of the latter process is varying from year to year due to outstanding warm and dry weather periods. Aluminium pushes caused by that may be responsible to some extent for the appearance and intensity of the magnesium deficiency symptoms on the spruces appearing since eight years but significantly varying in its intensity with time. Also nitrate leaching from the soil is influenced. An efflux of around 58 kg N ha^{-1} a^{-1} were found in 1988 and around 25 kg in 1987. Throughfall input amounts to around 20 to 25 kg N ha^{-1} a^{-1}. But total input may be higher due to N assimilation in the tree crowns which could not be realized completely. (orig.).

29201 (GSF–6/89, pp. 61-73) **Induction and healing of acute yellowing in spruce trees as a function of nutrient supply.** Senser, M. (Muenchen Univ. (Germany, F.R.). Botanisches Inst.); Hoepker, K.A. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

The symptoms of the spruce disease 'acute yellowing' are experimentally inducible and reversible. This was demonstrated by a container experiment with 3 years old spruce trees of different provenances using a forest soil. During the second year of the experiment the initially healthy trees developed symptoms of 'acute yellowing' on the forest soil. To date (after 4 years), however, no symptoms of yellowing have become apparent on the forest soil having been mixed with gardening mould (1:1) or fertilized with NPK(MG). 'Acute yellowing' could also be prevented by fertilization of the forest soil with only K or K in combination with other nutrients. In the case of already 'acute yellowed' young trees the combination forest soil + gardening mould resulted in a regreening of the twigs, whereas the symptoms of the disease persisted in the unfertilized forest soil. The supply of K to the needles was improved when the nitrogen-poor forest soil was fertilized with N (NO_3-N, NH_4-N) in addition to K. However fertilization with N but not K intensified the symptoms of 'acute yellowing'. The correlation between the occurrence and reversal of the 'acute yellowing' and the mineral supply of the needles was revealed by continuous estimations of the contents of the pigments and nutrient elements. (orig./MG).

29202 (GSF–6/89, pp. 75-87) **Development of acute yellowing in spruce trees.** Kandler, O. (Muenchen Univ. (Germany, F.R.). Botanisches Inst.); Miller, W. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

The development of 'acute yellowing' and regreening in spruce was followed by visual observations and by pigment, mineral and soil analyses. Studies of the population dynamics in stands revealed a small-scale spatial and temporal mosaic of yellowing and regreening trees, which was reflected by the Mg content of the needles, but not by changes in pH and in the amount of ammonia-exchangeable Mg in soil samples taken from the rooting areas of diseased and of healthy trees. These findings are not compatible with the assumption of an ecosystemic cumulative damage by air pollutants and their depositions, which should lead to an irreversible and much more uniform decline within the stands. The findings rather suggest an overlapping of a latent Mg deficiency with reversible damages (diseases) of the mycorrhizae, roots or vascular bundles of individual trees, which lead to an inhibition of the uptake or translocation of Mg resulting in acute Mg deficiency symptoms on soils poor in available Mg. (orig.).

29203 (GSF–6/89, pp. 89-94) **Gas exchange experiments on spruce trees in pure and ambient air in order to determine the air pollutant stress of the stand.** Koch, W. (Muenchen Univ. (Germany, F.R.). Lehrstuhl fuer Forstbotanik). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

A fumigation experiment with spruce in pure and ambient air has been running in the forest district Thiergarten, Bavarian Forests, since 1985. Apart from total gas exchange, the air pollutant stress of the stand is continually monitored. Since mid 1988 ozone and SO2 are added to the system at ambient levels and the twig in the chambers are simultaneously sprinkled with pure and acid rain resp. To date there are no differences in the daily courses or the balance. Forest growth data show clear signs of recovery during the last five years. (orig.).

29204 (GSF–6/89, pp. 95-106) **Effects of immissions on spruce stand ecosystems - results of forest damage research in the Fichtelgebirge mountains.** Schulze, E.D. (Bayreuth Univ. (Germany, F.R.). Lehrstuhl Pflanzenoekologie). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

In the study area of the Fichtelgebirge, the existing exposure to high concentrations of gaseous pollutants has had no long-lasting effect on needles of spruce; pathogens have only been secondary agents of the observed forest decline symptoms. Deposition of sulfur, nitrate, and ammonium, however, have significantly modified soil chemistry and plant nutrition. Spruce roots take up ammonium rather than nitrate with a negative antagonistic effect on Mg. Nitrate, left in the soil solution, is leached to groundwater together with sulfate, accelerating soil acidification and decreasing the Ca/Al and Mg/Al ratios in the soil solution. Soil solution chemistry affects root development and water and nutrient uptake by trees. Had all nutrients become equally deficient, spruce trees probably could have adjusted by retarding their growth, however, canopy uptake of atmospheric nitrogen in addition to root uptake stimulated growth, and caused a nitrogen to cation imbalance resulting in forest decline symptoms (Schulze, 1989). (orig.).

29205 (GSF–6/89, pp. 107-118) **Annual curves of changes in chloroplast pigments in a polluted spruce stand in the Fichtelgebirge mountains as a function of age and mineral nutrition of the needles.** Koestner, B. (Wuerzburg Univ. (Germany, F.R.). Inst. fuer Botanik und Pharmazeutische Biologie); Lange, O.L.; Czygan, F.C. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Annual time courses of changes in chloroplast pigments in both chlorotic and healthy spruce at the Oberwarmensteinach (Fichtelgebirge) study site indicate that pigment bleaching in damaged trees results from less accumulation of pigments in young needles during spring/summer and an additional decrease of pigments in older needles during late summer/fall. Correlations of pigment characteristics with mineral nutrition and photosynthetic capacity indicate that pigment reduction is physiologically regulated and results from magnesium deficiency in the needles rather than directly through damage by atmospheric pollutants. (orig.).

29206 (GSF–6/89, pp. 119-133) **Uptake, discharge and metabolism of NO_x, NH_4^+ and nitrate in forest trees, especially spruce trees.** Schulze, E.D. (Bayreuth Univ. (Germany, F.R.). Lehrstuhl Pflanzenoekologie); Gebauer, G. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Different nitrogen isotope ratios were found by mass spectrometry for different compartments of Norway spruce plants and for plants from declining and healthy sites of the Fichtelgebirge which reflect important differences during metabolism and transport of N containing substances within the trees. Laboratory irrigation and fumigation experiments showed that the N uptake via needles and bark can become a considerable amount for the total N nutrition of spruce. The uptake of gaseous NO_x via the needle surface is more important than the uptake of ammonium from wet depositions. Only small amounts of nitrate are taken up by the needle surface. N uptake rates are different for spruce trees which are in a different nutritional status. (orig.).

29207 (GSF–6/89, pp. 145-154) **Effects of acid rain and liming on a spruce site (Hoegiwald project).** Kreutzer, K. (Muenchen Univ. (Germany, F.R.). Lehrstuhl fuer Bodenkunde); Schierl, R.; Goettlein, A. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

An acid irrigation and liming experiment in an around 80 years old Norway spruce stand (Picea abies L. Karst.) on acid hapludult (pH (H_2O) 4.2, Ca/Al 0.3 at 20 cm depth) in Southern Bavaria was started in 1982. Up to now acid irrigation with 2.7 to 2.8 (mean annual input around 4 kmol H^+ ha^{-1}) caused only a pH decrease of 0.3 to 0.5 pH units, confined to the upper part of the organic surface layer. Almost the entire H^+ addition was buffered. The main buffering reactions were cation exchange in the upper part of the mineral soil, which were contributing to the buffering to around 15 resp. 80% of the H^+ addition. The cation exchange was connected with a strong reduction of the cation exchange capacity due to protonation of organic functional groups. Also leaching of the released cations Ca, Mg, Mn, K occurred. In the mineral soil the Al concentration increased but no change in Ca/Al and Mg/Al ratios because of leaching input from the organic layer above. Up to now the stand shows no severe damage symptoms in contrast to the ground flora and microorganisms. The absence of tree damages may be due to the fact, that the trees have access to horizons with better nutrient supply. That enables them to develop defensive mechanisms in the 'Al stress' horizons as pH increase on the rhizoplan and Al complexation in the mucilage. Mobilization of heavy metals, due to acidic treatment, was observed. Only Mn effect on Oxalis is suggested. Liming caused strong increase of nitrification and nitrate leaching before the background of an excess N supply mainly due atmospheric N input. Al, Pb and Cu were also mobilized by liming due to a hydrolysis-induced increase of soluble organic C, forming complexes with these metals. (orig.).

29208 (GSF–6/89, pp. 155-164) **What is a plant-damaging substance?** Ziegler, H. (Technische Univ. Muenchen (Germany, F.R.). Inst. fuer Botanik und Mikrobiologie). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

A review is given about the different types of anthropogenic plant damaging substances (APDS). We should distinguish between such compounds which are useful for the plant in low and toxic and higher concentrations, and others which are obstructive in any effective concentration. It is emphasized that there is a decisive difference between the toxicity of a compound for a single, isolated

plant and its effect on a plant in its natural environment. Definitions are given for APDS for single non-crop plants, for APDS for crop plants and for APDS for natural vegetation. (orig.).

29209 (GSF–6/89, pp. 165-184) **Effects of SO_2 on chloroplasts and leaves.** Dittrich, A. (Wuerzburg Univ. (Germany, F.R.). Inst. fuer Botanik und Pharmazeutische Biologie); Yin, Z.; Wagner, U.; Kolbowski, J.; Heber, U. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Uptake of SO_2 into leaves takes place almost exclusively through opened stomata. It can be calculated quantitatively after stomatal and boundary layer resistances have been determined. Inside the leaves, SO_2 diffuses across the plasmalemma of mesophyll cells. In the cytosol, it reacts with water to form H^+, HSO_2^- and SO_2^{2-}. Rates of the light-dependent reduction and oxidation of the anionic species and formation of adducts have been measured in chloroplasts as a function of concentration. Oxidation which involves radical reactions can be effectively suppressed by radical scavengers. Light-dependent cysteine-synthesis competes with oxidation and adduct formation. It is increased in the presence of O-acetylserine. Cytoplasmic acidification by H^+ can be compensated metabolically. Mineral deficiency and low temperatures decrease the ability of leaves to maintain cytoplasmic pH-stability. Results are discussed in relation to the contribution of SO_2 to forest decline in areas known to be exposed to atmospheric pollutants. (orig.).

29210 (GSF–6/89, pp. 185-194) **Sulfate and nitrate concentrations in needles and leaves as indicators of SO_2 or NO_2 pollution.** Lanzl, A. (Wuerzburg Univ. (Germany, F.R.). Lehrstuhl fuer Botanik 1); Kaiser, W.M.; Fuehrer, G.; Lippert, M. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Older needles of spruce trees from the Fichtelgebirge mountains contain sulfate and total sulphur concentrations in the some order of magnitude as found in spruce exposed to 1000 ppb SO_2 for 23 days (7 h per day). In gassing experiments on spruce and barley, the sulfate accumulation was used as an indicator of the minimum uptake of SO_2. The resulting H^+ exposure from H^+ released in needles and leaves ought to induce toxic pH changes in plant cells, but no significant pH changes were found in homogenized samples of leaves and needles. Further, there was no indication of proton discharge via the plant roots. The authors therefore concluded that the acid uptake is compensated for by basification or by acid decomposition, resulting in an unexpectedly high SO_2 tolerance of the plants. Exposure of spruce to 1000 ppb NO_2 (23 days) induced no measurable changes in the nitrate concentration. There appeared to be a quantitative reduction of the accumulated NO_2. No damage was observed. (orig.).

29211 (GSF–6/89, pp. 195-206) **Effects of environmental pollutants on photosynthesis and cell membranes of plants.** Urbach, W. (Wuerzburg Univ. (Germany, F.R.). Lehrstuhl fuer Botanik 1); Schmidt, W.; Kolbowski, J.; Ruemmele, S.; Reisberg, E.; Steigner, W.; Schreiber, U. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Effects of SO_2 and O_3 on photosynthetic processes of intact leaves and needles were investigated by means of fluorescence measurements. Changes of plant membrane properties by these air pollutants were analyzed by electrophysiological investigations with the unicellular green alga Eremosphaera viridis: SO_2 mainly effects the enzymatic processes of CO_2-fixation by acidification of the cell compartments. Exposures to O_3, however, primarily increase membrane permeability before photosynthesis is distinctly damaged. On the basis of reaction rates of O_3, calculations of O_3 uptake and distribution in different compartments of mesophyll cells have been carried out. (orig.).

29212 (GSF–6/89, pp. 207-214) **The contribution of photoinhibition to the effects of airborne pollutants on the photosynthesis apparatus.** Winter, K. (Wuerzburg Univ. (Germany, F.R.). Lehrstuhl fuer Botanik 2); Winkelmann, E.; Koeniger, M. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

The research project was to find out in howfar the negative effects of air-borne pollutants (e.g. SO_2) on photosynthesis, metabolic production and survival rates of deciduous and coniferous trees are enhanced, or even triggered, by high light intensities. In the course of a preliminary experiment without exposure to various gases, Nordmann's silver fir trees aged four to five years were cultivated in unshaded and shaded sites (70% reduction of the natural quantum flux). Yearly measurements of photosynthetic O_2 evolution in conditions of limited and saturated light as well as chlorophyll fluorescence measurements showed a marked inactivation of the photosyntheses apparatus in the cold season for the unshaded trees. This effect was less noticeable or non-existed in shaded trees. In order to determine the influence of high quantum flux in case of SO_2 exposure, sun leaves of Populus balsamifera L. were exposed for 8 hours to an extremely high atmospheric SO_2 concentration, both in darkness and in strong light. Unexpectedly, SO_2 exposure in darkness caused a much stronger decrease in the quantum yield and capacity of photosynthetic O_2 evolution than SO_2 exposure at 1550 μmol photons m^{-2} s^{-1}. It seems that light favours repair and detoxification processes which counteract the toxid effects of SO_2. Photoinhibition in the narrower sense was observed, however, when leaves pretreated for 8 hours in darkness with 2 ppm SO_2 were exposed the next day to a combination of strong light (1550 μmol photons m^{-1} s^{-1}) and unpolluted air. (orig./MG).

29213 (GSF–6/89, pp. 215-225) **Intracellular compartimentation of abscisic acid (ABA) in guard cells and mesophyll cells under exposure to SO_2.** Baier, M. (Wuerzburg Univ. (Germany, F.R.). Lehrstuhl fuer Botanik 1); Daeter, W.; Hartung, W. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

The effect of SO_2 on the intracellular compartimentation of ABA in guard cells and mesophyll cells of Valerianella locusta was investigated, using the efflux compartmental analysis, as described by Behl and Hartung (1986). The cytoplasmic ABA content of the guard cells was reduced drastically by 6 μmolxm^{-3} SO_2 (20% of

the controls). The vacuolar content was decreased less dramatically (70% of the controls). The ABA distribution of mesophyll cells remained uneffected by 6 μmolxm^{-3} SO_2. The SO_2 effects are explained by an acidification of the compartments. (orig.).

29214 (GSF–6/89, pp. 227-235) **The influence of peroxides on photosynthesis in spruce (Picea abies).** Maguhn, J. (Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Inst. fuer Oekologische Chemie); Gaeb, S.; Knoppik, D.; Selinger, H.; Drenkard, S. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

To determine the adverse effects of peroxidic air pollutants that are built up in the lower troposphere by photochemical reactions, their influence on photosynthesis in spruce has been investigated. By means of a gas-exchange-measurement system the net assimilation rate A and the stomatal conductance g^{ca} of a spruce twig have been observed during fumigation with ozone, hydrogen peroxide, methyl hydroperoxide, PAN, PPN, or PBzN. In addition, CO_2-response curves of A have been made in order to determine several important physiological parameters. Changes in these parameters caused by the peroxides allow the site and extent of an injury to be estimated. (orig.).

29215 (GSF–6/89, pp. 237-242) **Biochemical changes in the metabolism of affected beech trees (Fagus sylvatica L.) - secondary plant metabolites (phytoalexins) related to the pathogenic situation.** Sonnenbichler, J. (Max-Planck-Institut fuer Biochemie, Martinsried (Germany, F.R.)); Zielke, H. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

By quantitative analyses of low molecular weight compounds (m.w. < 1000) in beech leaves of trees under normal growth conditions and of trees affected by forest decline and exposed to ozone and pathogens, the relation between the synthesis of secondary plant metabolites (phytoalexins) and the pathogenic situation is investigated. (orig.).

29216 (GSF–6/89, pp. 243-251) **Sorption and permeation characteristics of cuticles for monoterpenes, with particular regard to the effects of gaseous pollutants on spruce trees.** Schoenwitz, R. (Technische Univ. Muenchen (Germany, F.R.). Lehrstuhl fuer Botanik); Schmid, C. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Partition coefficients of ^{14}C-limonene were determined for the system 'isolated cuticle /water'. For this reason sorption experiments were run using astomatous cuticles of Citrus, Ficus and Abies and stomatous cuticles of Picea. For all sorts of cuticles tested, the partition coefficients are about 10^5. This value validates a high accumulation of terpenes within the cuticle - an interesting aspect viewed from the standpoint of the repelling of pathogens by toxic terpenes. (orig.).

29217 (GSF–6/89, pp. 253-260) **Sorption and permeation properties of plant cuticles for gaseous pollutants and water after exposure to gaseous pollutants.** Lendzian, K.J. (Technische Univ. Muenchen (Germany, F.R.). Inst. fuer Botanik und Mikrobiologie). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Plant cuticles are permeable to SO_2 and NO_2 but not to O_3. The permeation is determined by three processes, i.g. sorption, diffusion and desorption. The overall process has been characterized by the permeance. The aim is to differ between the three transport parameters. Examples for experimental solutions are given. The ecological significance of binding of NO_2 to cuticular structures is discussed. (orig.).

29218 (GSF–6/89, pp. 261-270) **Simulation and analysis of the loss of inorganic ions from leaves under exposure to acid rain and airborne pollutants.** Riederer, M. (Technische Univ. Muenchen (Germany, F.R.). Inst. fuer Botanik und Mikrobiologie). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

The leaching of K^+, Cs^+, Mg^{2+} and Ca^{2+} has been studied under controlled conditions using isolated cuticular membranes from Citrus aurantium and leaf disks from Quercus robur, Fagus sylvatica and Robinia pseudoacacia. The steady state flow rate of cations across the cuticle depended on the H^+ concentration of the washing solution. This can be explained by an exchange process involving the counterions. Another component of leaching was the dissolution of ions from the leaf surface transported there across the cuticle during periods of time free of precipitation. High doses of ozone resulted in a significant increase of cation flow rates. (orig.).

29219 (GSF–6/89, pp. 271-280) **Quantitative studies on pollutant uptake by leaves: Cuticular permeability with particular regard to lateral heterogeneity of leaf surfaces.** Schoenherr, J. (Technische Univ. Muenchen (Germany, F.R.). Inst. fuer Botanik und Mikrobiologie); Schreiber, L.; Svenningson, M. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Methods suitable for determining uptake of solutes into leaves and needles are presented and discussed. Permeances (P) of cuticles of all leaves tested increased with decreasing polarity of test compounds (urea, 2,4-D, pentachlorophenol). Most uptake kinetics are biphasic, indicating that uptake proceeds into two compartments differing in permeability and capacity. Differences in P between compounds and species are difficult to interpret, since wettability of leaves is not the same for all leaves and the exact contact area between cuticle and solution is not known. (orig.).

29220 (GSF–6/89, pp. 281-292) **Microscopic structure and dynamics of plant cuticles and their modification during exposure to pollutants.** Sackmann, E. (Technische Univ. (CONF-8902175--: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

The temperature dependence of the local diffusion of fluorescent molecular probes of various polarity (alcanes, long chain fatty acid, short chain alcohol and fatty acid), all labeled with 7-nitrobenz-2-oxa-1,3-diazol-4-yl (NBD) in the cuticle of Clivia Miniata is studied by the photobleaching (FRAP) technique. The technique yields the coefficient of diffusion, D, in the plane of the cuticle over distances of some 30 μm and the fraction, R, of mobile reporter molecules. The inner (more hydrophilic) and the outer (more hydrophobic) face of the cuticle is studied separately by appropriate incubation. This yields different values of D. Ozone exerted during the growth of the plant causes an increase of the diffusion coefficient, both in the outer and the inner layer of the cuticle, e.g. by a factor of 2 for the alcane diffusion in the hydrophobic outer face. This points to defects in the polymerized matrix. (orig.).

29221 (GSF–6/89, pp. 293-298) **Investigations of the mycorrhiza reactions to ozone and acid mist.** Weiss, M. (Muenchen Univ. (Germany, F.R.). Inst. fuer Systematische Botanik). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). (CONF-8902175--: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Four walk-in environmental chambers were installed in the GSF in 1984/85, in which the effects of air pollutants and climate on plants can be investigated. They were particularly intended to promote the causal analysis of forest damage. The following factors were studied: O_3, SO_2, NO_2, acid mist, PAN, mineral supply, frost effects, biological factors such as parasites, genetic and developmental constitution. Approx. 80% of the studies focussed on the effect of O_3 on plants. With regard to the significance of the investigated factors for forest damage it is concluded, that most of the factors can lead to effects which may contribute to the development of tree damage. The complexity of the subject, however, impedes definite conclusions e.g. concerning threshold values which are the basis for immission limits. (orig./MG).

29223 (GSF–6/89, pp. 315-325) **Element concentrations in rings of injured trees.** Elling, W. (Fachhochschule Weihenstephan, Freising (Germany, F.R.). Fachbereich Forstwirtschaft); Fiedler, C.; Schramel, P. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). (CONF-8902175--: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Spruce trees from 4 different sites in Bavaria were investigated by dendrochronological and chemical methods. Time course and extent of injury are established by dendrochronological procedures. Annual increment layers of the wood were separated by tools made of silicon nitride, to avoid contamination of samples. Using different techniques of chemical analysis, concentrations of 20 elements were determined. The suitability of these elements for monitoring changes in environmental conditions is discussed; special attention is directed to the possibility of radial transport in the bole of trees. The most promising elements are Fe, Al, Ti, Cr and Ni. (orig.).

29224 (GSF–6/89, pp. 417-432) **Gas exchange measurements as a method for early detection of tree damage in mountain forest sites.** Knoppik, D. (Technische Univ. Muenchen, Freising (Germany, F.R.). Lehrstuhl fuer Physik); Selinger, H.; Dunkl, M. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). (CONF-8902175--: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Gas exchange measurements are analysed on the basis of a photosynthesis model. This yields a lot of characteristic parameters which can be changed due to pollutants. An improved method of analysing measurements of chlorophyll fluorescence gives additional information about injuries of the photosynthetic apparatus. These methods were applied in indoor and outdoor experiments for investigation of a possible influence especially of photooxidants on photosynthesis. (orig.).

29225 (GSF–6/89, pp. 433-442) **Laboratory comparison of the stomatal opening behaviour of alpine fir trees and ozone-burdened trees.** Maier-Maercker, U. (Muenchen Univ. (Germany, F.R.). Lehrstuhl fuer Forstbotanik). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Available from NTIS (US Sales Only), PC A23/MF A01.

Specially designed experiments confirm the hypothesis that O_3 specifically disturbs water balance. A poor water balance caused by irregular stomatal behaviour appears in twig material treated with O_3 and also in damaged material from Wank. The resulting reduction in osmotic potential of damaged needles is examplarily shown in cuvette experiments and in the stand in Wank. The effect of the emissions is interpreted as a shift of the set point of the sensor in the stomatal control loop. (orig.).

29226 (GSF–6/89, pp. 443-455) **Peroxide detoxification of spruce needles in forest sites of the Northern Alps (Wank).** Polle, A. Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

Photooxidants have been assumed to play a major role in the new-type forest decline observed in the Northern Alps. This group of air pollutants may raise the cellular content of toxic oxygen species and can affect the detoxification metabolism for these harmful compounds. Therefore, in the current project we investigate the content of peroxides, the content of antioxidants, as well as the activity of enzymes related to the metabolism of toxic oxygen species in needles of damaged and healthy spruce trees. As an example, we report on seasonal changes of the activity of superoxide dismutase, its dependency on the degree of injury of the trees, and its relation to the elevation of the forest. (orig.).

29227 (GSF–6/89, pp. 477-486) **Effects of air pollutants and other stress factors on phytohormone concentrations in trees.** Schneider, P. (Technische Univ. Muenchen, Freising (Germany, F.R.). Fakultaet fuer Landwirtschaft und Gartenbau); Horn, K.; Hock, B. Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

It was investigated whether air pollutants and other stress factors caused concentration changes of the gibberellin GA_3 in needles of Norway spruce. For this purpose, clonal material was assayed, which had been treated with ozone and acid mist over 14 months under controlled conditions in the exposition chambers of the GSF. In addition, trees of the habitat 'Wank' were analyzed. GA_3 was extracted and purified by 4 clean-up steps including HPLC. An enzyme immunoassay was used for the quantitative determination. No significant differences could be detected between the samples, treated with ozone plus acid mist, and the controls. Furthermore, no correlation could be found, so far, between the degree of damage of the trees at the habitat 'Wank' and the GA_3 concentrations in needles. (orig.).

29228 (GSF–6/89, pp. 487-496) **Analysis of phytohormones and secondary plant products (main flavonoids and terpenes) in healthy and damaged needles from the natural location.** Kraus, M. (Technische Univ. Muenchen (Germany, F.R.). Inst. fuer Botanik und Mikrobiologie). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU); Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.). Jul 1989. (In German). (CONF-8902175–: 1. PBWU status seminar on forest decline, Neuherberg (Germany, F.R.), 27 Feb - 1 mar 1989). In *1st PBWU status seminar on forest decline. Proceedings.* Order Number DE90773485. Available from NTIS (US Sales Only), PC A23/MF A01.

The determination of the phytohormone abscisic acid (ABA) in needles of fir (Abies alba Mill.) is difficult due to the small amount of ABA and the large volume of phenolic and terpenoic compounds, which have similar structures compared with ABA. The quantitative analysis of ABA in purified extracts was not possible by HPLC because of deficient separation. A qualified method for exact quantification is gas chromatography using an electron capture detector. In this way ABA was completely separated from all other substances. Starting from the question, whether the content of secondary plant products of needles of Picea abies (L.) Karst. is influenced by damage, spruces from Wank Mountain were analysed. The needle concentrations of different compounds were influenced significantly by the class of damage as well as by the level of altitude. (orig.).

29229 (Juel–2326) **Quantitative investigations of NO_2-uptake by plants - construction of an exposition system and results with sunflowers (Helianthus annuus L.).** Latus, C. Kernforschungsanlage Juelich GmbH (Germany, F.R.). Inst. fuer Radioagronomie; Bonn Univ. (Germany, F.R.). Nov 1989. 103p. (In German). Order Number DE90773652. Available from NTIS (US Sales Only), PC A06/MF A01.

The present work provides a contribution towards answering the question in which way the NO_2-N supply in this low atmospheric concentration range is utilized. The aim of the investigation was therefore to determine experimentally the nitrogen uptake from the NO_2 in the air by the parts of the plant above ground with the NO_2 concentrations realistically occurring in the atmosphere. Therefore a cylindrical exposure chamber with a volume of 164 l was constructed. It was then installed in a growth chamber so that reproducible temperature and illumination conditions could be ensured. The NO_2 nitrogen in the plant was studied with the stable-isotope-measuring-technique on the basis of ^{15}N as the tracer. The air fed in was therefore purified from natural NO_2, and $^{15}NO_2$ was added in controlled doses. During the period of plant exposure, the temperature, light intensity and relative atmospheric humidity were conditioned in the chamber. Sunflowers (Helianthus annuus giantheus) served as the experimental plants. One plant each was placed into the exposure chamber at the age of 20 to 30 days. After an adaptation period of 1 day, $^{15}NO_2$ was fed into the incoming air. The NO_2 uptake was measured by two independent methods. The studies have shown that at realistic NO_2 concentrations sunflowers take up NO_2 and incorporate it into their biomass. Even during NO_2 exposure in the dark phase, reduction equivalents are made available by the plant, which reduce the NO_2 supplied to ammonium and convert it into an organic bond. At the time of harvesting, immediately after NO_2 exposure, 84% of the absorbed NO_2-N was localized in organic compounds and 16% in the ammonium fraction. The NO_2 concentrations had no influence on the exchange of other gases between the plant and atmosphere. (orig./MG).

29230 (KFK–4514) **Studies in uptake and turnover of tritiated water vapour (HTO) by vegetables.** Roller, M. Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Hauptabteilung Sicherheit; Stuttgart Univ. (Germany, F.R.). Fakultaet 7 - Geo- und Biowissenschaften. Feb 1989. 141p. (In German). Order Number DE90773642. Available from NTIS (US Sales Only), PC A07/MF A01.

The aerial parts of vegetables were exposed to tritiated water vapour for up to three days in a plant growth chamber. The species used were Raphanus sativus L., Phaseolus vulgaris K. and Daucus carota L. (red radish, bean and carrot). The increase of specific activity of tissue free water as collected by freeze drying which was observed in the aerial parts of plants is explained by direct uptake of tritiated water vapour by the exposed part of the plant. It shows different characteristics for the several organs. No translocation of water from the laminae into other parts of the plant was observed. After combustion of dry matter tritium activity was detectable in the oxidation water for all parts of the plants. Kinetics of the specific activity of organically bound tritium in leaves can be described by a single curve. The lower - steep - part of the curve is increasing approximately with the uptake rate of HTO; this is explained by reversible binding of tritium by isotopic exchange reactions. The upper - flat - part of the curve represents tritium bound by light dependent reducing reactions of photosynthesis; it is increasing with a rate similar to the growth rate of leaves. (orig./KG).

29231 (PB–90-132564/XAB) **Identification of SARA (Superfund Amendments and Reauthorization Act) compounds in adipose tissue. Final report, August 1988-August 1989.** Onstot, J.D.; Stanley, J.S. Midwest Research Inst., Kansas City, MO (USA). 31 Aug 1989. 139p. (MRI–8862-A). Available from NTIS, PC A07/MF A01.

The National Human Adipose Tissue Survey (NHATS), administered by EPA/OTS, is an on-going chemical monitoring network designed to detect levels and prevalences of toxic substances in the adipose tissue of the general U.S. population. Adipose specimens collected in fiscal year 1982 were analyzed as composites for volatile and semivolatile organic compounds via HRGC/MS as part of a previous effort. The data files were then processed to determine the occurrence of compounds selected from the Superfund

Amendments and Reauthorization Act (SARA) Title III Toxic Chemical Listing, and from the SARA Section 110 CERCLA listing of 100 hazardous substances. A total of 61 volatile and 120 semivolatile target compounds were selected for analysis from the listings based on their predicted suitability to the analytical method. Application of target compound analysis (TCA) to 46 composited adipose tissue samples resulted in the identification of 13 volatile and 19 semivolatile compounds. Frequency of occurrence data was compiled with respect to three age groups, four census regions and nine census divisions.

29232 (PB–90-153552/XAB) **Cumulative asbestos exposure and forced vital capacity.** Ayer, H.; Burg, J. Cincinnati Univ., OH (USA). Dept. of Environmental Health. 1975. 21p. Available from NTIS, PC A03/MF A01.

Part of the data from a retrospective study of asbestos (1332214) textile workers was used to relate loss in forced vital capacity (FVC) to cumulative asbestos exposure. Using occupational histories and the results of air sampling analyses, estimates of individual cumulative asbestos fiber exposures were made for asbestos textile workers. Only those workers with more than 10 years of exposure were included in the analysis. The patterns of exposure in the production workers indicated high exposures in the 1930s, dramatic reductions in the late 1930s to early 1940s, and some further reduction to about 1950 with little change thereafter to the conclusion of the study. A relationship was developed between the ratio of the observed FVC to predicted FVC and the logarithm of exposure by linear regression. Tests were also made using office workers in the same textile facility. Weavers and yarn production workers had FVCs which were less than the predicted values and less than those of the office workers. A progressive effect was noted of asbestos dust exposure on FVC. Each doubling of cumulative asbestos fiber exposure above 100 fiber years/cubic centimeter resulted in a loss of 5 to 10% in FVC.

29233 (PB–90-153776/XAB) **NIOSH (National Institute for Occupational Safety and Health) testimony to DOL (Department of Labor) on benzene and leukemia: An epidemiologic risk assessment to the Occupational Safety and Health Administration by J. D. Miller, August 9, 1985.** Rinsky, R.A.; Smith, A.B.; Hornung, R.; Filloon, T.G.; Young, R.J. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). 9 Aug 1985. 47p. Available from NTIS, PC A03/MF A01.

In the testimony, the mortality experience of a cohort with occupational exposure to benzene (71432) was updated to learn more about a possible connection to leukemia. Job/exposure matrices were used to derive cumulative exposure concentrations. The matrices were based on available air sampling data. The standardized mortality ratio (SMR) for leukemia was 328 and the SMR for multiple myeloma was 298. SMRs for leukemia increased from 105 in workers with less than 40 part per million years (ppm/y) cumulative exposure to 314 in workers with from 40 to 199.99 ppm/y; to 1,757 in those with from 200 to 399.99 ppm/y; and to 4,535 in those with 400 ppm/y or more. A 40-year working lifetime exposure at 10 parts per million was equivalent to a cumulative benzene exposure of 400 ppm/y. When the boundaries of the exposure categories were varied, this strongly positive trend in SMRs remained evident. A conditional logistic regression was performed to examine the shape of the exposure/response relation. A log linear model best explained the association between cumulative benzene exposure and leukemia. It was calculated from the model that protection against benzene induced leukemia will be increased exponentially by any reduction in the permissible exposure limit.

29234 (PB–90-153800/XAB) **NIOSH (National Institute for Occupational Safety and Health) comments to DOL (Department of Labor) to the Occupational Safety and Health Administration regarding the update of the NIOSH criteria document on beryllium by J. F. Finklea, December 10, 1975.** National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). 10 Dec 1975. 10p. Available from NTIS, PC A02/MF A01.

The testimony presented concerns the development of a standard for controlling occupational exposures to beryllium (644017). Attention was given to the entire issue of beryllium's carcinogenic potential. The testimony was a follow-up to earlier communication and supplied information requested. The information included a review of not only new information, but also a gathering of older information to put into more proper perspective the entire issue of the carcinogenic potential of the element. Analysis of the information available indicated that beryllium does pose a carcinogenic risk to man, so that occupational exposures should be reduced to a minimum through engineering and/or personal protective controls. An evaluation was also attached of the currently available sampling and analytical methods. A question was raised over the correctness of results of analysis of volatile beryllium compounds due to possible sampling errors. While it was not felt that this concern at present was serious enough to delay the institution of the standard, NIOSH will provide additional information on the problem as it becomes available.

29235 (PB–90-154709/XAB) **Oxygen free radicals in pulmonary fibrosis. Final report.** Shatos, M.A.; Mossman, B.T. Vermont Univ., Burlington, VT (USA). Dept. of Pathology. 17 Apr 1989. 8p. Available from NTIS, PC A02/MF A01.

Studies conducted in the areas of lung cells, asbestos and oxygen free radicals were summarized. The research resulted in considerable experience in lung cell culture development, the processing of an antisera to the antioxidant enzymes superoxide-dismutase (SOD) and glutathione-peroxidase, and the completion of several studies which indicate that asbestos-induced injury to lung cells in vitro and in vivo may be mediated by oxygen free radicals. Studies related to the development of the antiserum to SOD demonstrated the involvement of active oxygen species as mediators of injury by long asbestos fibers to the cells of the respiratory tract. Other studies demonstrated the unsuccessful phagocytosis of long fibers of asbestos coupled with the generation of oxygen free radicals which might explain the increased pathogenic potential of long fibers in asbestos associated diseases of the respiratory tract. Studies were also reviewed which focused on the possible role of oxygen free radicals on asbestos associated injury in normal lung fibroblasts, a target cell in pulmonary fibrosis. Studies were conducted which resulted in the confirmation of the importance of active oxygen species in asbestos-related lung injury and suggested the possible future use of a novel therapeutic approach to clinical asbestosis.

29236 (PB–90-155896/XAB) **Asbestos-related disease: A community epidemic in the making.** Lemen, R.A.; Selikoff, I.J.; Hurst, G.A.; Wagoner, J.K. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Field Studies and Clinical Investigations. 1990. 7p. Available from NTIS, PC A02/MF A01.

The importance of epidemiological assessments in tracing the development of disease among workers was demonstrated in the report concerning the exposure of workers to asbestos (1332214) particles. A field survey made at a thermal pipe insulation facility in the southwestern portion of the United States measured airborne asbestos concentrations of 15 to 20 times the current standard. A significant number of workers employed for less than 10 years at this site demonstrated symptoms and signs consistent with asbestos-related diseases. Potential for community exposure was also great. Prior to the opening of this facility in the southwest, its predecessor was operating in the northeastern United States from the early 1940s through 1954. A study of a 900 member cohort of former employees at this earlier site was completed and demonstrated a highly significant excess of asbestos related diseases, malignant and nonmalignant in nature. A study of family members living with the worker at the time of employment, indicated that 50% of these family members had x-ray abnormalities consistent with asbestos-related disease. Other reports indicating that asbestos-related diseases were not limited to the worker were cited as well.

29237 (PB–90-155904/XAB) **Epidemiology of asbestos-related diseases.** Dement, J.M. National Inst. for Occupational Safety and Health, Morgantown, WV (USA). Div. of Respiratory Disease Studies. Jul 1981. 49p. Available from NTIS, PC A03/MF A01.

Although there were several anecdotal reports from earlier times, the first well documented case of asbestosis was reported in 1906 in a worker engaged in the production of asbestos textiles. In 1917 a report of ten cases of pulmonary fibrosis occurring at a Pennsylvania facility was published. The first detailed epidemiologic study of asbestos workers was undertaken in Great Britain in 1928. The first indication that asbestos might be a human carcinogen came in

1935 with the report of three independently diagnosed cases of lung cancer detected during autopsy of asbestos workers. Epidemiologic studies have now repeatedly demonstrated an association between asbestos exposure and increased mortality due to asbestosis, lung cancer, pleural and peritoneal mesothelioma, and gastrointestinal cancer. In some studies asbestos exposure has also been associated with increased risks for laryngeal cancer and cancer of the buccal cavity and pharynx. Studies which have been concerned with exposure to crocidolite, amosite, anthophyllite, tremolite, and chrysotile were highlighted. Other topics reviewed included asbestos contamination of other minerals, the combined effects of asbestos exposure and tobacco smoke, mortality and pleural radiographic changes, and mixed fiber exposures.

29238 (PB–90-155920/XAB) **Spray application of fireproof insulation at the construction site of the Proctor and Gamble Technical Center, Blue Ash, Ohio.** Lemen, R.A. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Field Studies and Clinical Investigations. 15 Aug 1972. 7p. Available from NTIS, PC A02/MF A01.

Worker exposures to asbestos during application of fireproofing insulation materials at the Proctor and Gamble site in Blue Ash, Ohio were examined. Personal membrane filter sampling devices were placed on four workers involved in the spraying and mixing operation. During the spraying operation, each of the four workers became literally covered with the sprayed-on material. Buildings, grounds, and everything within a 50-foot radium of the spray unit were also covered. Only the mixer pump operator was furnished with a respirator which he was not wearing when observed. The workers took their work clothing home at the end of the day. Even though the exposure to the workers was below the standard at the time of wet spraying, increased exposures were possible to the mixer pump operator when opening the bags with the asbestos-containing material, and also after the sprayed-on material had dried and was being cleaned up around the area of spraying by dry sweeping. Respirators should be supplied to all workers spraying or cleaning up or working around the asbestos-containing material. Clothing and laundering should be provided by the company doing the spraying. The use of hanging tarpaulins was suggested to prevent the spread of the materials outside the spraying area. Materials not containing asbestos should be substituted.

29239 (PB–90-155938/XAB) **In depth survey report of Carolina Freight Carriers, Carlisle, Pennsylvania, and York, Pennsylvania.** Zaebst, D.D. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Surveillance, Hazard Evaluation and Field Studies. Sep 1989. 50p. (IWS–146.17). Available from NTIS, PC A03/MF A01.

An in-depth study was made of worker exposures to diesel exhaust as part of a case/control mortality and industrial hygiene study of truck drivers, dock workers and mechanics presumably exposed to this aerosol in the course of their jobs. Samplings were taken at the Carolina Freight Carriers Terminal located in Carlisle and York, Pennsylvania. Measurements of elemental carbon taken during mild weather conditions indicated exposures only slightly above ambient highway concentrations of 3.8 micrograms/cubic meter (microg/cu m) in most jobs. Geometric mean exposures to submicrometer elemental carbon ranged from 5.5 microg/cu m in dock workers using gas powered tow motors to 8.9 microg/cu m in road drivers driving road tractors equipped with horizontal exhaust systems. The geometric mean exposures to elemental carbon in all jobs were significantly higher than the geometric mean ambient concentration of 0.75 microg/cu m measured in a residential area of Harrisburg. Only very low or nondetectable levels of other components such as nitrogen oxides, respirable particulates, polycyclic aromatic hydrocarbons or nitro substituted polycyclic aromatic hydrocarbons were reported from this sampling. Those which were detectable were far below allowable levels.

29240 (PB–90-155953/XAB) **Chrysotile asbestos in industry.** Wallingford, K.M. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Surveillance, Hazard Evaluation and Field Studies. 23 Feb 1978. 22p. Available from NTIS, PC A03/MF A01.

The six major forms of asbestos were reviewed and then the most widely used form, chrysotile, was examined in more detail. The three largest industries using chrysotile include the asbestos/cement pipe industry, the asbestos friction products industry, and the asbestos textiles industry. A discussion was given for the production operations and products made in each of these industries. A brief comparison was included of the optical and electron microscopy techniques used in asbestos exposure evaluation. The United States Public Health Service, in 1964, initiated a comprehensive industrial hygiene study of these three industries to characterize the exposures to chrysotile asbestos and to establish new sampling and analytical methods. Some recent research based on samples collected during the study was reviewed as well. In comparing the usefulness of phase contrast microscopy and electron microscopy, it was determined that the phase contrast microscopy technique provided relatively good indications of asbestos fibers greater than 5 micrometers in length.

29241 (PB–90-161852/XAB) **Health-hazard evaluation report HETA 88-156-1984, Georgia Gulf Corporation, Tiptonville, Tennessee.** Calvert, G.M.; Mathias, C.G.T. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Aug 1989. 27p. (HETA–88-156-1984). Available from NTIS, PC A03/MF A01.

The Georgia Gulf Corporation, Tiptonville, Tennessee, was investigated because of an outbreak of dermatitis. The facility produced polyvinyl-chloride compound by blending polyvinyl-chloride resin with other ingredients. Rashes were reported by 22 production workers and three clerical or management workers. Examination of seven of the workers indicated that all of them appeared to have contact dermatitis. Rashes were found in areas of the body where powders may come in contact with the body, and the rashes improved when away from work. Blender operators had a significantly elevated risk of developing dermatitis compared with production workers who had lower exposures to dusts and powders. The report concludes that the dermatitis was probably of occupational origin, due to exposure to airborne pigment powders and acrylic polymers containing residual monomers. The report recommends measures to reduce exposures and prevent dermatitis, including showering at the end of a work shift that involved exposure to dusts and powders, reduction of airborne dust levels through engineering controls, and the use of protective clothing, barrier creams, and skin moisturizers.

29242 (PB–90-162470/XAB) **NIOSH (National Institute for Occupational Safety and Health) manual of analytical methods (Third edition). Third supplement.** National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Physical Sciences and Engineering. 15 May 1989. 222p. Available from NTIS, PC A10/MF A02.

See also PB–88-204722.

This supplement contains 34 methods of analysis for 69 toxic chemical compounds and serves as an update to the NIOSH manual of analytical methods. Methods were selected on the basis of their use, input from the clients and NIOSH chemists on need for change, and the health implications of the compounds. Methods were included for acetaldehyde, acetic-acid, acrylonitrile, aldehydes, aliphatic amines, aminoethanol compounds, asbestos bulk and fibers, 1-butanethiol, chlordane, hexavalent chromium compounds, cyanuric-acid, ethyleneamines, endrin, fibers, formaldehyde, furfuryl-alcohol, glutaraldehyde, hydrogen-cyanide, isocyanates, ketones, mercury, methyl-methacrylate, nitrosamines, pentachlorophenol, quartz in coal mine dust, ribavirin respirable crystalline silica, sulfur-dioxide, toluene diamines, and valeraldehyde.

29243 (PB–90-163676/XAB) **National occupational-health survey of mining asbestos report.** National Inst. for Occupational Safety and Health, Morgantown, WV (USA). Div. of Respiratory Disease Studies. 4 Feb 1988. 82p. Available from NTIS, PC A05/MF A01.

The report concerned the results of surveys of four asbestos mines (SIC-1499) which were visited during May, June and July of 1984. The data collected were related to occupational health program and policy information in place at these facilities; an inventory of all health-related substances found on mine property; and a series of worksite observations detailing potential exposures to chemical and physical agents. The report identified potential exposures and provided the associated numbers of workers, the

occupations of those workers, and the locations on the mine property where the potential exposures were observed. The information was categorized into seven tables: four concerning chemical agents; one concerning musculoskeletal overload conditions; one physical exposure conditions; and one welding processes. Estimated annual usage information was provided for chemical substances, both generic and tradenames. Several other types of data were also gathered including laboratory analyses of a portion of the bulk dust taken from several locations at each operation.

29244 (PB–90-163700/XAB) **National occupational-health survey of mining boron minerals report.** National Inst. for Occupational Safety and Health, Morgantown, WV (USA). Div. of Respiratory Disease Studies. 18 Oct 1988. 201p. Available from NTIS, PC A10/MF A02.

The report concerned occupational health data for boron minerals mining (SIC-1474) based on surveys during June and July of 1984. Four boron minerals facilities were surveyed and data collected concerning occupational health program and policy information; the presence of all health related substances found on mine property; and a series of worksite observations which detail potential exposures to chemical and physical agents. The report identified potential exposures and provided the associated numbers of workers, the occupations of those workers, and the locations on the mine property where the potential exposures were observed. This information was categorized into seven tables: four concerning chemical agents; one concerning musculoskeletal overload conditions; one concerning physical exposure conditions; and one concerning welding processes. Estimated annual usage information was provided for chemical substances, both generic and tradenames.

29245 (PB–90-163742/XAB) **Mechanisms of cytoskeletal injury by heavy metals.** Perrino, B.A. Boston Univ., MA (USA). School of Medicine. 22 Jun 1989. 6p. Available from NTIS, PC A02/MF A01.

The major aim of the study was to determine whether metallothionein (MT) disassembly and inhibition of assembly caused by cadmium, mercury, and lead in cultured 3T3 cells was due to binding to tubulin sulfhydryl groups or binding to and activation of CaM. Methylmercury was used as a model for adverse effects to MT due to tubulin sulfhydryl binding in the extracted cytoskeleton model system and during the polymerization of purified MT proteins in vitro. The results indicated that, like calcium, the inhibitory effect of cadmium on the polymerization of purified MT proteins containing tubulin and microtubule associated proteins was enhanced by exogenously added CaM, suggesting that microtubule associated proteins were involved in mediating the sensitivity of MT to cadmium activated CaM. The findings that cadmium, like calcium, can support the binding of CaM to tubulin and MAPs in Western blots of purified MT proteins support the proposal that MAPs are important to the increased sensitivity of MT to cadmium activated CaM. The stimulation by cadmium or calcium/CaM dependent protein-kinase-II, resulting in MAP phosphorylation and MT disassembly and inhibition of assembly was not investigated.

29246 (PB–90-164047/XAB) **Bioremediation of contaminated surface soils.** Sims, J.L.; Sims, R.C.; Matthews, J.E. Environmental Protection Agency, Ada, OK (USA). Robert S. Kerr Environmental Research Lab. Aug 1989. 28p. (EPA–600/9-89/073). Available from NTIS, PC A03/MF A01.

Biological processes, including microbial degradation, have been identified as critical mechanisms for attenuating organic contaminants during transit through the vadose zone to the groundwater. On-site soil remedial measures using biological processes can reduce or eliminate groundwater contamination, thus reducing the need for extensive groundwater monitoring and treatment requirements. On-site remedial systems that utilize the soil as the treatment system accomplish treatment by using naturally occurring microorganisms to treat the contaminants. Treatment often may be enhanced by a variety of physical/chemical methods, such as fertilization, tilling, soil pH adjustment, moisture control, etc. The development of a bioremediation program for a specific contaminated soil system includes: (1) a thorough site/soil/waste characterization; (2) treatability studies; and (3) design and implementation of the bioremediation plan. Biological remediation of soils contaminated with organic chemicals has been demonstrated to be an alternative treatment technology that can often meet the goal of achieving a permanent clean-up remedy at hazardous waste sites.

29247 (PB–90-164807/XAB) **Control technology for ethylene oxide sterilization in hospitals.** Mortimer, W.D.; Kercher, S.L. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Physical Sciences and Engineering. Sep 1989. 182p. (DHHS/PUB/NIOSH–89-120). Available from NTIS, PC A09/MF A01.

Errata sheet inserted.

The report examines control methods and systems for EtO sterilization in hospitals. Nine sterilizer control systems were evaluated in eight hospitals during week-long, in-depth surveys. Three emission sources typically account for most of the EtO routinely released into the work environment. First, most of the EtO gas mixture from the chamber is released to the indoor atmosphere at the air gap located at the connection of the drain to the outlet of the water sealed vacuum pump. Second, the opening of the sterilizer door at the completion of the cycle may result in a very short high exposure to the sterilizer operator followed by an increase in the workroom EtO concentration. Third, the load transfer procedure provides the closest contact with EtO for .the sterilizer operator: pulling the load from the sterilizer, transporting the load to the aerator, and inserting the load into the aerator. EtO exposures from hospital sterilizers can be controlled to not exceed a ceiling limit of 5 ppm and to average less than 0.1 ppm for a full shift.

29248 (PB–90-168980/XAB) **Hazard and operability study of an ethylene oxide sterilizer for National Institute for Occupational Safety and Health. Final report.** National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Dec 1988. 78p. (ECTB–146-20B). Available from NTIS, PC A05/MF A01.

A hazard and operability (HAZOP) study was conducted on a sterilizer supplied by compressed gas cylinders of ethylene-oxide (EtO). The sterilizer installation, equipment, and operational procedures were reviewed, and recommendations were developed both specifically for the studied installation and for the generic installation. The sterilizer consisted of a jacketed chamber and associated pumps, pipes, filters, valves and other equipment. Sterilizer facility design, sterilizer equipment design, leak monitoring, system utilities, equipment maintenance, and operational procedures were discussed. These recommendations should provide guidance to hospitals installing EtO sterilizers. The study also showed how the HAZOP study procedures which are typically used in large chemical facilities can be used on a small scale setting. The HAZOP study involved evaluating the facility as a series of systems. Log sheets of information gathered were included in the report. A process diagram of an EtO sterilizer was included along with a schematic of EtO piping from tanks to sterilizer, a schematic of EtO sample line, calibration gas line, and carrier gas line, and schematics of the air inlet line to chamber and the piping from EtO tank to supply valve.

29249 (PB–90-860891/XAB) **Urea/phenol/melamine formaldehyde polymeric resins. January 1970-February 1990 (A Bibliography from the NTIS data base). Report for January 1970-February 1990.** National Technical Information Service, Springfield, VA (USA). Feb 1990. 137p. Available from NTISPC N01/MF N01.

Supersedes PB–88-869029.

This bibliography contains citations concerning characteristics, safe use regulations and standards, and applications of formaldehyde polymeric resins. Modelling, test procedures, and test results for identifying the hazards of formaldehyde resin system emissions are presented. Methods of preparation and modification of formaldehyde foams for use in the building industry are included. Corrosion of formaldehyde polymeric foam thermal insulation, crosslinking and catalysis of phenol-formaldehyde polymer concrete, and urea-formaldehyde waste disposal are considered. (This updated bibliography contains 238 citations, 17 of which are new entries to the previous edition.)

29250 The production of mutagens in cooked foods. Volume 7. Knize, M.G. (University of California, Livermore,CA (USA)); Shen, N H; Felton, J.S. 18p. Air Pollution Control Assoc., Pittsburgh, PA (USA) (1988). (CONF-880679–: 81. annual meeting of

Air Pollution Control Association, Dallas, TX (USA), 19-24 Jun 1988).
88-130.5.

Epidemiological evidence suggests that many human cancers are caused by dietary factors [8], but determining the causitive factors has proven difficult. The introduction of the Ames/Salmonella mutation test in l975 provided a quick way to determine mutagenic potencies of chemicals and complex mixtures. The mutagenic response is thought to be one step in cancer induction. In this review the authors compare the mutagenic profiles for fish, chicken, and beef and discuss probable precursors for formation of these mutagenic heterocyclic amines.

29251 Three phases of plant response to atmospheric CO_2 enrichment. Idso, S.B. (Water Conservation Laboratory, Phoenix, AZ (USA)). *Plant Physiology (USA),* 87(1): 5-7 (May 1988).

Several years of research on seven different plants (five terrestrial and two aquatic species) suggest that the beneficial effects of atmospheric CO_2 enrichment may be divided into three distinct growth response phases. First is a well-watered optimum-growth-rate phase where a 300 parts per million increase in the CO_2 content of the air generally increases plant productivity by approximately 30%. Next comes a nonlethal water-stressed phase where the same increase in atmospheric CO_2 is more than half again as effective in increasing plant productivity. Finally, there is a water-stressed phase normally indicative of impending death, where atmospheric CO_2 enrichment may actually prevent plants from succumbing to the rigors of the environment and enable them to maintain essential life processes, as life ebbs from corresponding ambient-treatment plants.

29252 Patterns of stable carbon isotope discrimination ($\delta^{13}C$) in pinus taeda as a function of ozone stress. Taylor, G.E. Jr. (Oak Ridge National Lab., TN (USA)); Gunderson, C.A.; Edwards, N.T. *Plant Physiology, Supplement (USA),* 89(4): 129 (Apr 1989).

This research tested the hypothesis that ozone stress shifts the isotopic composition of carbon ($\delta^{13}C$) in needles of Pinus taeda L. (loblolly pine) seedlings grown under realistic field conditions using open top chambers. Three different ozone exposure regimes were maintained for two growing seasons. At the end of the second year, foliage exhibited two statistically significant patterns in $\delta^{13}C$ values: (1) a decrease (more negative) from -24.86 to -28.16 per mil with needle age and (2) an increase from -27.15 to -25.95 per mil with increasing ozone stress. Whereas all needle age classes exhibited the same response as a function of ozone stress, the most pronounced shift in $\delta^{13}C$ was in the youngest age class. In conjunction with intensive gas-exchange studies, the direction and magnitude of the shift in response to ozone indicates that the pollutant's effects on foliar gas-exchange processes are greater on stomatal physiology than on carbon dioxide assimilation. Consequently, it is proposed that one of the seasonally integrated effects of elevated levels of ozone stress on foliage of P. taeda is lower stomatal conductance to water vapor and thus more efficient water use. An untested corollary is that seedlings grown at ambient levels of ozone stress are more susceptible to drought than their counterparts grown at elevated levels of ozone.

29253 Responses to heat shock, arsenite and cadmium in soybean. Edelman, L. (Dept. of Energy, East Lansing, MI (USA)); Key, J.L. *Plant Physiology, Supplement (USA),* 89(4): 133 (Apr 1989).

Heat shock (HS), arsenite (As) and cadmium (Cd) treatments induced the HS response in soybean seedlings but differed in their abilities to induce stress tolerance. Pretreatment of seedlings with sub-lethal HS protected them from subsequent normally lethal HS treatment. However, the protection was much more pronounced in 1 day-old than in 2 day-old plants. Sublethal arsenite pretreatment resulted in only a low level of protection against lethal As or HS treatment and severe damage still occurred in specific tissues. Cadmium did not induce any self- or cross-protection. DNA sequence analyses revealed that HS, As and Cd induced the transcription of similar sequences. However, Northern blot analyses of HS mRNAs, and analyses of in vitro translation products and in vivo-labeled proteins by 1D and 2D SDS-PAGE demonstrated that, compared to HS, the response to the chemical stresses was slower, less intense and not as selective. Apparently any causal relationship between HS proteins and induced stress tolerance must also involve developmental-, tissue-, and/or quantitative-specificities.

29254 Regulation of poly(gamma-glutamycysteinyl)glycine synthesis. Robinson, N.J. (Univ. of Durham (England)); Lindsay, W.P.; Delhaize, E.; Berger, J.M.; Jackson, P.J. *Plant Physiology, Supplement (USA),* 89(4): 196 (Apr 1989).

In cell lines of Datura innoxia increased synthesis of $(gammaEC)_nG$ is detected 5 min after exposure to Cd and this rapid response is largely insensitive to cycloheximide. In the absence of exogenous cysteine, glutathione pools are depleted coincident with $(gammaEC)_nG$ synthesis implying an element of regulation at step(s) in the pathway after glutathione synthetase. A variant cell line, Cd-300, accumulates Cd-$(gammaEC)_nG$ aggregates more rapidly than wild type, WDI, cells. However, initial rates of synthesis of the apopolypeptide are similar in both cell lines. Therefore, increased $(gammaEC)_nG$ synthesis in response to Cd is not regulated by product removal due to Cd-aggregate formation. However, pulse chase experiments using (^{35}S)-cysteine show that a large pool of $(gammaEC)_nG$ is unavailable for the synthesis of $(gammaEC)_{n+1}G$ following exposure to Cd. S^{2-} is also a component of some Cd-$(gammaEC)_nG$ complexes in Cd-300 cells.

29255 Sister chromatid exchange in painters recently exposed to solvents. Kelsely, K.T. (Harvard School of Public Health, Boston, MA (USA)); Little, F.F.; Little, J.B.; Baker, E.L. Jr.; Wiencke, J.K. *Environmental Research (USA),* 50(2): 248-255 (Dec 1989).

Epidemiologic studies have suggested that exposure to solvent-based materials in the painting trades is associated with an increased cancer risk. In order to determine if the solvent exposures of current union members of the International Brotherhood of Painters and Allied Tradesman (IBPAT) are associated with a genotoxic risk, we have measured the sister chromatid exchanged (SCE) frequency in their peripheral blood lymphocytes. Previous reports have shown that chronic solvent exposure of these workers dose not elevated SCE frequencies. We now report that acute exposure, estimated by number of days worked over the month prior to venipuncture, is associated with elevated SCE levels in currently smoking workers. No elevation in SCE was associated with similar recent exposure in nonsmoking, solvent-exposed painters.

29256 Cellular lead toxicity and metabolism in primary and clonal osteoblastic bone cells. Long, G.J. (Brookhaven National Laboratory, Upton, NY (USA)); Rosen, J.F.; Pounds, J.G. *Toxicology and Applied Pharmacology (USA),* 102(2): 346-361 (Feb 1990).

A knowledge of bone lead metabolism is critical for understanding the toxicological importance of bone lead, as a toxicant both to bone cells and to soft tissues of the body, as lead is mobilized from large reservoirs in hard tissues. To further understand the processes that mediate metabolism of lead in bone, it is necessary to determine lead metabolism at the cellular level. Experiments were conducted to determine the intracellular steady-state ^{210}Pb kinetics in cultures of primary and clonal osteoblastic bone cells. Osteoblastic bone cells obtained by sequential collagenase digestion of mouse calvaria or rat osteosarcoma (ROS 17/2.8) cells were labeled with ^{210}Pb as 5 microM lead acetate for 20 hr, and kinetic parameters were determined by measuring the efflux of ^{210}Pb from the cells over a ^{210}-min period. The intracellular metabolism of ^{210}Pb was characterized by three kinetic pools of ^{210}Pb in both cell types. Although the values of these parameters differed between the primary osteoblastic cells and ROS cells, the profile of ^{210}Pb was remarkably similar in both cell types. Both types exhibited one large, slowly exchanging pool (S3), indicative of mitochondrial lead. These data show that primary osteoblastic bone cells and ROS cells exhibit similar steady-state lead kinetics, and intracellular lead distribution. These data also establish a working model of lead kinetics in osteoblastic bone cells and now permit an integrated view of lead kinetics in bone.

29257 Early inhibition of photosynthesis during development of Mn toxicity in tobacco. Nable, R.O. (Univ. of Kentucky,

Lexington (USA)); Houtz, R.L.; Cheniae, G.M. *Plant Physiology (USA)*, 86(4): 1136-1142 (Apr 1988).

Early physiological effects of developing Mn toxicity in young leaves of burley tobacco (Nicotiana tabacum L. cv KY 14) were examined in glass-house/water cultured plants grown at high (summer) and low (winter) photon flux. Following transfer of plants to solutions containing 1 millimolar Mn^{2+}, sequential samplings were made at various times for the following 9 days, during which Mn accumulation by leaves increased rapidly from ≈ 70 on day 0 to ≈ 1700 and ≈ 5000 microgram per gram dry matter after 1 and 9 days, respectively. In plants grown at high photon flux, net photosynthesis declined by ≈ 20 and ≈ 60% after 1 and 9 days, respectively, and the onset of this decline preceded appearance (after 3 to 4 days) of visible foliar symptoms of Mn toxicity. Intercellular CO_2 concentrations and rates of transpiration were not significantly affected. Though the activity of latent or activated polyphenol oxidase increased in parallel with Mn accumulation, neither leaf respiration nor the activity of catalase [EC 1.11.1.6] and peroxidase [EC 1.10.1.7] were greatly affected. These effects from Mn toxicity could not be explained by any changes in protein or chlorophyll abundance. Additionally, they were not a consequence of Mn induced Fe deficiency. Therefore, inhibition of net photosynthesis and enhancement of polyphenol oxidase activity are early indicators of excess Mn accumulation in tobacco leaves.

29258 Effect of carbon dioxide enrichment on development of the first six mainstem leaves in soybean. Leadley, P.W. (North Carolina State Univ., Raleigh (USA)); Reynolds, J.F. *American Journal of Botany (USA)*, 76(10): 1551-1555 (Oct 1989).

Many conclusions concerning plant responses to CO_2 enrichment have been based on assumptions of increased leaf size derived from observations of average leaf area measured at some time well into the growth period. The objective of this study were to study the effect of elevated CO_2 on (1) the timing of mainstem leaflet appearance, (2) the rate and duration of leaflet expansion, and (3) the final area of individual leaflets of soybeans (Gylcine max [L.] Merr. cv. Bragg) grown from seed at 348, 502, and 645 μ1 1^{-1} CO_2 concentrations. Central leaflet areas from mainstem trifoliolates 1-6 were measured every two days time of appearance to full expansion. Leaflets tended to appear earlier in elevated CO_2 treatments; leaflets 2 through 6 appeared an average of 0.4 days earlier in the 502 μ1 1^{-1} treatment and 1.2 days earlier in the 645 μ1 1^{-1} treatment than in the 349 μ1 1^{-1} treatment. Relative rates of expansion were different among leaflets in their response to elevated CO_2; expansion rates of leaflets 1 and 4 were significantly higher at the highest CO_2 concentration. However, final area of leaflets was not affected by CO_2, or (in leaflet 5 only) was slightly smaller at the highest CO_2 treatment. Apparently, higher expansion rates of leaflets 1 and 4 at high CO_2 were offset by a tendency for decreased duration of expansion. It appears that there are morphological constraints on final leaflet area in soybean seedlings which limit the effects of elevated CO_2 on the early development of mainstem leaf area.

29259 Cyanide inactivation of hydrogenase from Azotobacter vinelandii. Seefeldt, L.C. (Univ. of California, Riverside (USA)); Arp, D.J. *Journal of Bacteriology (USA)*, 171(6): 3298-3303 (Jun 1989). DOE Contract FG03-84ER13257.

The effects of cyanide on membrane-associated and purified hydrogenase from Azotobacter vinelandii were characterized. Inactivation of hydrogenase by cyanide was dependent on the activity (oxidation) state of the enzyme. Active (reduced) hydrogenase showed no inactivation when treated with cyanide over several hours. Treatment of reversibly inactive (oxidized) states of both membrane-associated and purified hydrogenase, however, resulted in a time-dependent, irreversible loss of hydrogenase activity. The rate of cyanide inactivation was dependent on the cyanide concentration and was an apparent first-order process for purified enzyme (bimolecular rate constant, 23.1 M^{-1} min^{-1} for CN^-). The rate of inactivation decreased with decreasing pH. [^{14}C]cyanide remained associated with cyanide-inactivated hydrogenase after gel filtration chromatography, with a stoichiometry of 1.7 mol of cyanide bound per mol of inactive enzyme. The presence of saturating concentrations of CO had no effect on the rate or extent of cyanide inactivation of hydrogenases. The results indicate that cyanide can cause a time-dependent, irreversible inactivation of hydrogenase in the oxidized, activatable state but has no effect when hydrogenase is in the reduced, active state.

29260 (AD-A-216500/9/XAB) **Effects of pulsed and c-w (continuous-wave) 2450-MHz radiation on transformation and chromosomes of human lymphocytes in vitro. Final report, 1 October 1986-15 December 1989.** Davis, C.C. Maryland Univ., College Park, MD (USA). Dept. of Electrical Engineering. 15 Dec 1989. 52p. Available from NTIS, PC A04/MF A01.

This report describes the results of research in the following areas: Whether spontaneous or phytohemagglutinin-induced transformation of human lymphocytes in vitro is affected by exposure to continuous wave (CW) or pulsed wave (PW) 2450 MHz microwaves. It is affected -by PW in a non-thermal way. Comparison of CW and PW microwave exposure at the same average specific absorption rate (SAR) - PW is markedly different and acts in a non-heating way. Comparison of effects obtained by microwave and conventional heating needed to elevate the sample temperature by 0.5,1.0,1.5 and 2.0 C. CW microwaves and conventional heating produce the same effects, PW exposure behaves differently. An attempt is made to determine whether chromosomal aberrations are induced under the conditions of the experiment.

29261 (AD-A-216869/8/XAB) **Effects of field orientation during 700-MHz radiofrequency irradiation of rats.** Frei, M.R.; Jauchem, J.R.; Padilla, J.M. School of Aerospace Medicine, Brooks AFB, TX (USA). 1989. 9p. (USAFSAM-JA-88-67). Available from NTIS, PC A02/MF A01.

Pub. in Phsiological Chemistry and Physics and Medical NMR, Vol. 21, 65-72(1989).

Ketamine-anesthetized Sprague-Dawley rats were exposed to far-field 700-MHz continuous-wave radiofrequency radiation (RFR) in both E and H orientations. Irradiation was conducted at whole-body average specific absorption rates (SARs) of 9.2 and 13.0 W/kg (E and H, respectively) that resulted in approximately equivalent colonic specific heating rates (SHRs). Exposures were performed to repeatedly increase colonic temperature by 1 deg C (38.5 to 39.5 deg C). Tympanic, tail, left and right subcutaneous (toward and away from RFR source), and colonic temperatures, arterial blood pressure, and respiratory rate were continuously recorded. In spite of equivalent colonic SHRs and the reduced E-orientation average SAR, the right subcutaneous, tympanic, and tail SARs, SHRs and absolute temperature increases were significantly greater in E than in H orientation. The cooling rate at all monitoring sites was also significantly greater in E than in H orientation. Heart rate and mean arterial blood pressure significantly increased during irradiation; however, changer between orientations were not different. Respiratory rate significantly increased during irradiation in H, but not in E orientation. These results indicate that during resonant frequency irradiation, differences occur in the pattern of heat deposition between E- and H-orientation exposure. When compared with previous investigations performed at supraresonant frequencies, the lower level of cardiovascular change in this study was probably related to the lower periphery-to-core thermal gradient.

Our work is a contribution to computer aided supervision of continuous processes. It is inspired by an area of Artificial Intelligence: qualitative physics. Here, supervision is based on a model which continuously provides operators with a synthetic view of the process; but this model is founded on general principles of control theory rather than on physics. It involves concepts such as high gain or small time response. It helps in linking temporally the evolution of various variables. Moreover, the model provides predictions of the future behaviour of the process, which allows action advice and alarm filtering. This should greatly reduce the famous cognitive overload associated to any complex and dangerous evolution of the process.

29265 (JINR–E6-89-725) **Investigations of the separation of Np, Pa, U, Th and REE in geological samples.** Gleisberg, B.; Ly, B.M.; Gorski, B. Joint Inst. for Nuclear Research, Dubna (USSR). [1989]. 18p. Sponsored by Joint Institute for Nuclear Research. (CONF-8909225–3: Actinides '89, Tashkent (USSR), 24-29 Sep 1989). Order Number DE90009783. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; JINR, Publishing Dept., Head Post Office, P.O. Box 79101000, Moscow, USSR.

The quantitative determination of trace amounts of Th, U and REE in very depleted rocks is necessary to get information about genetic processes in the investigated area. U, Th and REE are used as geochemical indicators. We treated two types of geological samples which differ considerably in their origin and in the U, Th, REE contents. It is clear that the analytical methods and chemical separation procedures should be very different for these two types of materials. Two different schemes of separation were tested and compared: Cation exchange and solvent extraction and extraction chromatography. To estimate the suitability of the described separation schemes for the determination of REE in types of samples being rich in U or Th but poor in REE and thus demanding separation from U Or Th before irradiation, the behavior of U and Th is presented in this paper as well. 8 refs., 7 figs., 5 tabs.

29266 (LA-UR–90-51) **Hydro-thermo-mechanical response of a fractured rock block.** Kelkar, S.; Zyvoloski, G. Los Alamos National Lab., NM (USA). [1990]. 8p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-36. (CONF-900646–8: 31. US symposium on rock mechanics, Golden, CO (USA), 18-20 Jun 1990). Order Number DE90008460. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Hydro-thermo-mechanical effects in fractured rocks are important in many engineering applications and geophysical processes. Modeling these effects is made difficult by the fact that the governing equations are nonlinear and coupled, and the problems to be solved are three dimensional. In this paper we describe a numerical code developed for this purpose. The code is finite element based to allow for complicated geometries, and the time differencing is implicit, allowing for large time steps. The use of state-of-the-art equation solvers has resulted in a practical code. The code is capable of fully three dimensional simulations, however, in this paper we consider only the case of two dimensional heat and mass flow coupled to one dimensional deformation. Partial verification of the code is obtained by comparison with published semianalytical results. Several examples are presented to demonstrate the effects of matrix expansion, due to pore pressure and heating, on fracture opening due to fluid injection. 16 refs., 11 figs.

29267 (LA-UR–90-99) **Liquifaction of fluid saturated rocks due to explosion-induced stress waves.** Dey, T.N.; Brown, J.A. Los Alamos National Lab., NM (USA). [1990]. 15p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-900646–7: 31. US symposium on rock mechanics, Golden, CO (USA), 18-20 Jun 1990). Order Number DE90006481. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Shock-induced liquefaction of a water-saturated rock may occur during the passage of a large amplitude stress wave, such as that due to an explosive. We studied this phenomena numerically with the aid of a material model which incorporates effective stress principles, and experimentally with a gas gun. Our numerical model is capable of calculating material response for both small and large deformation and any initial saturation. Phase transitions of the solid phase and the water phase are also allowed. Fitting the model to dry gas gun experiments allowed reasonable predictions of nearly saturated experiments. Liquefaction, the loss of shear strength when pore pressure exceeds the mean stress, appears to occur during the unloading portion of these experiments. The pore crushing which occurs, even under fully saturated conditions, leads to greater attenuation of a stress wave, as well as liquefaction of the rock and a lengthening of the wave duration, as the wave passes. 12 refs., 4 figs.

29268 (LA-UR–90-721) **An anomalous wind between valleys—its characteristics and a proposed explanation.** Stone, G.L.; Hoard, D. Los Alamos National Lab., NM (USA). [1990]. 19p. Sponsored by U.S. Department of Defense. (CONF-9006111–3: 5. conference on mountain meteorology, Boulder, CO (USA), 26-29 Jun 1990). Order Number DE90008965. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Beginning in 1986, the US Army engaged the Los Alamos National Laboratory to study meteorological operations at several sites where toxic materials are stored. The main objective of the study was to develop recommendations for a system that could forecast the transport and dispersion of airborne materials in the event of an accident. In the course of that project, detailed meteorological and tracer experiments were conducted at the Army's Tooele Depot, 60 km southwest of Salt Lake City, Utah. During these investigations we observed that the direction of near-surface flow through low passes connecting two adjacent valleys is often opposite to the prevailing gradient flow. In this sense, the wind was considered "anomalous." In this paper we discuss the statistical properties of this intervalley flow and use a case study to illustrate its vertical structure in relation to the surrounding terrain and the overlying gradient flow. A simplified analysis of the thermal energy changes in the valley atmospheres is used to explain the origin of this local flow. 5 figs.

29269 (LBL–28600) **Coupled behavior of rock joints.** Tsang, Chin-Fu. Lawrence Berkeley Lab., CA (USA). Feb 1990. 35p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-900640–5: International conference on rock joints, Loen (Norway), 4-6 Jun 1990). Order Number DE90009222. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The behavior of rock joints under various coupled processes is reviewed under four broad categories: hydromechanical processes, thermohydromechanical processes, hydromechanical-chemical processes, and thermomechanical-hydrochemical processes. The state-of-the-art and possible directions of further research in these coupled processes are discussed. Rock joint behaviors considered include not only dilation, closure, shear and joint propagation, but also changes in flow permeability and chemical sorption and retardation capabilities. These properties are of critical concern in practical considerations of the rock mass as a medium to store and isolate chemical and radioactive wastes. Investigations of coupled processes in two-fracture systems and multi-fracture systems are pointed out as interesting areas for future research. The need to consider coupled processes in borehole testing procedures involving rock joints is emphasized. 70 refs., 12 figs.

29272 (NAGRA-NTB–85-10) **Exploratory boreholes Boettstein, Weiach, Riniken, Schafisheim, Kaisten, Leuggern: fluid-logging. Temperature, salinometer and spinner-flowmeter measurements: Text volume.** Kleboth, P. (Geotest AG, Zollikofen (Switzerland)). Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland). Nov 1988. 127p. (In German). Available from Nagra, CH-5401 Baden, Switzerland.

As part of the hydrogeological investigations in the six exploratory boreholes drilled by NAGRA in northern Switzerland until 1986, a comprehensive data collection programme aimed at the localisation and characterization of zones of increased rock permeability was carried out. Within this programme the 'Fluid Logging' campaign investigated temperature, conductivity and flow conditions of the borehole fluid column. The present report is a comprehensive collection of the most important Fluid-logging runs from all six boreholes (Boettstein, Weiach, Riniken, Schafisheim, Kaisten and Leuggern). The first part of the report presents the methodology followed and describes the operating principles of the temperature, salinometer and spinner-flowmeter tools used, the range of their application and their performance. The second part of the report details the individual logging runs for each borehole. It describes the borehole history, which is important for the interpretation of results and states the boundary conditions e.g. water level in well, pump rate, difficulties encountered etc. Results are presented as composite logs. The fluid logs are compared with the relevant geological data indicating high permeability zones and the provisional results from the numerous hydraulic tests. (author) 15 tabs., 35 figs.

29273 (NAGRA-NTB–88-14) **Inverse modeling of Chalk River block.: HYDROCOIN - level 2/case 3, level 3/case 5a.** Carrera, J. (E.T.S.I. Caminos. U.P.C., Barcelona (Spain)); Heredia, J. Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland). Dec 1988. 124p. Available from Nagra, CH-5401 Baden, Switzerland.

Within the framework of the international project HYDROCOIN, a block of fractured monzonitic gneiss within the facilities of Chalk River National Laboratories, Canada, was selected as a test case to study and develop strategies for the calibration and validation of groundwater flow models. Adopting a quasi-three dimensional formulation, the fractures were simulated by two-dimensional finite elements and the rock mass was simulated by strings of line elements. The models were calibrated using, first, steady-state data and, second, transient data. Model calibration involved both identification of model parameters and model structure. Model parameters were obtained by automatic estimation based on measures of the model response and prior information about the model parameters. Excellent agreement between measured and computed heads was obtained for the transient runs. However, such match was only fair in steady-state. Model Structures Identification criteria were used to rank the performance of several model structures. In the steady state the model structure identification criteria did not strongly support increasing the model complexity. However, it is also believed that the information content of the steady state data was quite poor. In contrast, the transient data being both more numerous and more informative than steady-state data, allowed the model structure identification criteria to suggest more complex models. The validation runs were performed on data corresponding to interference pump tests different from the ones used for calibration. The prediction errors in these runs were relatively small and consistent with the calibration uncertainty. Furthermore, the ranking of the models performances during validation runs was the same as the one obtained at the calibration stage, using Model Structure Identification Criteria. (author) 26 figs., 17 tabs., 39 refs.

29274 (NAGRA-NTB–88-31) **Grimsel test site: radar crosshole tomography with application to migration of saline tracer through fracture zones.** Niva, B. (Swedish Geological Co., Uppsala (Sweden)); Olsson, O.; Bluemling, P. Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland). Oct 1988. 108p. Available from Nagra, CH-5401 Baden, Switzerland.

A comprehensive radar crosshole tomography survey has been carried out at the Grimsel Rock Laboratory in order to test the radar method with respect to its capability to describe geological features and to map migration of saline tracer through difference tomography. The radar survey has provided a map of the attenuation and slowness distribution of radar waves in a planar section with the dimensions 150x225 m. The program has included measurement points along parallel boreholes and a tunnel connecting these boreholes. The slowness and attenuation tomograms give similar images of the structures at the investigated site. The largest anomalies are caused by lamprophyric dikes which are almost parallel to the boreholes while fracture zones give rise to anomalies of smaller magnitude. The attenuation tomograms have poorer resolution and contain more artifacts than the slowness tomograms. This is caused by systematic errors in the amplitude data caused by inadequate knowledge of the antenna radiation pattern for source points located in the tunnel. The transport of saline tracer was investigated by making a tomographic inversion of the difference between data collected prior to injection of saline tracer and during injection. Two such experiments were performed with different injection points. The largest concentrations of tracer were observed close to the injection points. The tracer followed fracture zones extending from the injection points. The results clearly show the capabilities of the radar method to map tracer transport through fractured rock. (author) 33 figs., 5 tabs., 14 refs.

29275 (NAGRA-NTB–89-07) **Stripa Project: interim report on the rock sealing project (stage 1).** Pusch, R. (Clay Technology (Sweden)); Boergesson, L.; Fredrikson, A.; Markstroem, I.; Erkstroem, I.; Ramqvist, G.; Gray, M.; Coons, B. Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland). Sep 1988. 194p. Available from Nagra, CH-5401 Baden, Switzerland.

The objective of the Sealing Project is to find new ways of sealing finely fractured rock by grouting. This requires development of new injection techniques as well as identification of materials which are sufficiently fluid to be groutable, have an acceptably low permeability and are physically and chemically stable. The present report describes the results of the first two years of investigations (Stage 1) which gave very positive results, as can be concluded from the large-scale field test. (author) 88 figs., 27 tabs., 6 refs.

29276 (SAND–89-2126C) **Surface roughness and the physical properties of fractures.** Brown, S.R. Sandia National Labs., Albuquerque, NM (USA). 1990. 9p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. (CONF-900646–5: 31. US symposium on rock mechanics, Golden, CO (USA), 18-20 Jun 1990). Order Number DE90006046. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

This paper presents a brief review of previous work on the effect of surface roughness on the physical properties of fractures. 25 refs., 7 figs.

29277 (SAND–89-2913C) **Combining acoustic emission locations and a microcrack damage model to study development of damage in brittle materials.** Holcomb, D.J.; Stone, C.M.; Costin, L.S. Sandia National Labs., Albuquerque, NM (USA). [1990]. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-900646–3: 31. US symposium on

rock mechanics, Golden, CO (USA), 18-20 Jun 1990). Order Number DE90005195. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Under compressive stresses, brittle polycrystalline materials fail as the result of the growth, interaction and coalescence of microcracks. To predict the deformation of damaging material, constitutive laws developed for such materials must incorporate the effects of crack size, density, orientation, and interaction. A method of incorporating the accumulation and growth of microcracks into a continuum model is to use a measure of microcrack growth and interaction defined as damage. Although a number of damage theories have been proposed, there is no generally accepted experimental technique for detecting and measuring damage. Acoustic emissions (AE) have been correlated with microcrack nucleation and growth. We propose that AE locations and density are useful measures of damage that can be correlated with calculated damage. Our approach is to use acoustic emissions (AE) and computer modeling to study the development of damage in geomaterials. 7 refs., 2 figs.

29278 (UCRL–101526) **Block analysis for preliminary design of underground excavations.** Yow, J.L. Jr. Lawrence Livermore National Lab., CA (USA). Jan 1990. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900646–10: 31. US symposium on rock mechanics, Golden, CO (USA), 18-20 Jun 1990). Order Number DE90008300. Available from NTIS, PC A02/MF A01 - OSTI.

Rock mass discontinuities such as joints and faults often intersect to form discrete blocks that are individually stronger than the rock mass as a whole. When encountered during mining or construction, such blocks can cause stability problems. Displacement of the blocks around an excavation, can affect the rock mass in a hydrologic sense and in a mechanical sense. Hydrologic effects of block displacement can include the creation of preferred pathways for fluid flow or the creation of barriers to unsaturated flow of liquids. Mechanical effects occur because unhealed joints cannot support tensile stress, tend to limit the shear stress that the rock mass can carry, and reduce the rock mass stiffness locally as they open. Block theory and related analytical techniques have been developed to address problems of block identification and kinematic stability. These techniques can identify and screen potentially troublesome blocks early in the design process. Although more detailed analyses can be applied in later stages of the design effort to develop block reaction curves or to evaluate the effects of loosening around, the initial process of block identification and screening is the theme of this discussion. 12 refs., 1 fig., 5 tabs.

29279 (UCRL-ID–103499) **Recording of anomalous shear energy in the teleseismic P-wave coda at Long Valley Caldera, California, on a small aperture array.** Zucca, J.J. (Lawrence Livermore National Lab., CA (USA)); Zandt, G.; Steck, L.K.; Prothero, W A Lawrence Livermore National Lab., CA (USA). Mar 1990. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008189. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Anomalous energy in the coda of teleseismic P-waves at Long Valley caldera has been suggested to be a P to S converted arrival, perhaps with the conversion occurring at the boundaries of magma bodies beneath the caldera. We have collected new data with a small-aperture, three-component array located in the northwestern quadrant of the caldera with the purpose of testing this hypothesis. An examination of three teleseismic events using array and particle motion techniques shows that converted P- to S-waves comprise a significant fraction of the early arriving anomalous energy. In volcanic areas such as Long Valley, the scattered energy could originate at a high velocity contrast feature such as magma body interface. In addition, later arriving energy was detected with slow phase velocity and is tentatively identified as body wave to surface wave scattering. Our interpretation is illustrated with waveforms of two earthquakes from the Kuril Islands and one in northern Peru. Our results show that a small-aperture, three-component array can be used to perform detailed analysis of the coda. 12 refs., 8 figs., 1 tab.

29280 **Stoichiometry of the iron oxidation reaction in silicate melts.** Kress, V.C. (Univ. of California, Berkeley (USA)); Carmichael, I.S.E. *American Mineralogist (USA),* 73(11-12): 1267-1274 (Nov-Dec 1988).

Experiments have been performed that calibrate the stoichiometry and thermodynamics of the iron oxidation reaction in natural silicate melts. A series of experiments was carried out on six melt compositions covering a far larger range of oxygen fugacities than had been examined previously. Oxygen fugacities between air and 5.2 $\log_{10}$ units below those defined by the nickel-nickel oxide assemblage were investigated at 1360 C and 1460 C. Results of these experiments confirm that $\ln(X_{Fe_2O_3}/X_{FeO})$ is a linear function of $\ln f_{O_2}$ over this entire range, and that this linear behavior is independent of composition over the range considered. These results are inconsistent with an ideal mixing between FeO and Fe_2O_3 components. They are, however, entirely consistent with ideal mixing between FeO and $FeO_{1.464\pm0.003}$ (FeO $6Fe_2O_3$) components. A second series of experiments was performed on a single mid-ocean ridge basalt composition (JDFD2) in order to better constrain the temperature dependence of the iron oxidation reaction in this simplified two-component subsystem. This series was carried out at temperatures between 1299 C and 1636 C in air, CO_2, and 0.2 $\log_{10}$ units below the fayalite-magnetitie-quartz buffer assemblage. Results of both series of experiments were combined with the Sack et. al. (1980) and Kilinc et al. (1983) databases to estimate thermodynamic parameters for the iron oxidation reaction expressed in terms of FeO and $FeO_{1.464}$ components. These coefficients offer the most precise method available for estimation of iron oxidation state in natural silicate melts as a function of $\ln f_{O_2}$, temperature, and composition.

29281 **Particle size distributions and the sequential fragmentation/transport theory applied to volcanic ash.** Wohletz, K.H. (Earth and Space Science Division—Los Alamos National Laboratory, New Mexico (USA)); Sheridan, M.F.; Brown, W.K. *Journal of Geophysical Research (USA),* 94(B11): 15703-15722 (10 Nov 1989).

The assumption that distributions of mass versus size interval for fragmented materials fit the log normal distribution is empirically based and has historical roots in the late 19th century. Other often used distributions (e.g., Rosin-Rammler, Weibull) are also empirical and have the general form for mass per size interval: $n(l)=kl^{\alpha}\exp(-l\beta)$, where $n(l)$ represents the number of particles of diameter l, l is the normalized particle diameter, and k, α, and β are constants. We describe and extend the sequential fragmentation distribution to include transport effects upon observed volcanic ash size distributions. The sequential fragmentation/transport (SFT) distribution is also of the above mathematical form, but it has a physical basis rather than empirical. The SFT model applies to a particle-mass distribution formed by a sequence of fragmentation (comminution) and transport (size sorting) events acting upon an initial mass m': $n(x, m)=C\int\int n(x', m')p(\xi)\,dx'\,dm'$, where x' denotes spatial location along a linear axis, C is a constant, and integration is performed over distance from an origin to the sample location and mass limits from 0 to m.

29282 (AD-A–216938/1/XAB) **Characteristics of cosmic infrared variable sources. Final report, 1 October 1986-30 September 1989.** Jones, T.J. Minnesota Univ., Minneapolis, MN (USA). Dept. of Physics and Astronomy. 15 Sep 1989. 52p. Available from NTIS, PC A04/MF A01.

Results of infrared photometric observations of 63 AFGL sources over the past nine years are presented. Using these data together with previous measurements of these stars, we determine pulsation periods and mean photometric characteristics. These stars are found to lie midway between classical Mira variables and the Radio Luminous OH/IR stars in their period distribution and photometric properties. For the sample as a whole, there is no evidence for sudden or transient behavior such as a switch in pulsation mode.

Rather, these stars show rapid, but continuous, evolution from shorter period Miras with weak mass loss to longer periods and larger mass loss rates. The carbon rich stars in our sample have the same period distribution as the oxygen rich stars. None of the carbon stars have periods as long as those of the very long period Radio Luminous OH/IR stars.

29283 (N-90-16596) **Reports of planetary astronomy, 1986.** National Aeronautics and Space Administration, Washington, DC (USA). Aug 1987. 129p. (NASA-TM-100776;NAS-1.15:100776). Available from NTIS, PC A07/MF A01.

A compilation of abstracts of reports from Principal Investigators funded through NASA's Planetary Astronomy Program, Office of Space Science and Applications, is presented. The purpose is to provide a document which succinctly summarizes work conducted in this program for 1986. Each report contains a brief statement on the strategy of investigation and lists significant accomplishments within the area of the author's funded grant or contract, plans for future work, and publications.

29284 (N-90-16607, pp. 1-2) **Analytical study of comet nucleus samples.** Albee, A.L. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR-184821;NAS-1.26:184821;LPI-CONTRIB-691;CONF-890195-: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Analytical procedures for studying and handling frozen (130 K) core samples of comet nuclei are discussed. These methods include neutron activation analysis, x ray fluorescent analysis and high resolution mass spectroscopy.

29285 (N-90-16607, pp. 3-4) **The origin, composition and history of cometary ices from spectroscopic studies.** Allamandola, L.J. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR-184821;NAS-1.26:184821;LPI-CONTRIB-691;CONF-890195-: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The spectroscopic analysis of pristine cometary material provides a very important probe of the chemical identity of the material as well as of the physical and chemical conditions which prevailed during the comet's history. Concerning classical spectroscopy, the spectral regions which will most likely prove most useful are the infrared, the visible and ultraviolet. Newer spectroscopic techniques which have the potential to provide equally important information include nuclear magnetic resonance (NMR) and electron spin resonance (ESR). Each technique is summarized with emphasis placed on the kind of information which can be obtained.

29286 (N-90-16607, pp. 5-7) **Experimental studies of gas trapping in amorphous ice and thermal modelling of comets: Implications for Rosetta.** Bar-nun, A. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR-184821;NAS-1.26:184821;LPI-CONTRIB-691;CONF-890195-: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The trapping of mixtures of CO, CH_4, N_2 and Ar in amorphous water ice was studied experimentally. It is shown that the ice particles could not have been formed at a higher temperature and, subsequently, cool down. Experiments where ice was deposited at elevated temperatures, then cooled down and gas was flowed into the ice, showed that the amount of trapped gas depends only on the highest temperature at which the ice was formed, or resided, prior to cooling and gas flow into it. Consequently, the cometary ice had to be formed at approx. 48 K and the ice is therefore amorphous. The thermal profile of a comet in Halley's orbit was calculated, including the build-up of an insulating dust layer. It was found that an insulating dust layer a few cm thick is enough to choke most of the water emission from the surface. A similar thermal model was calculated for comet P/Temple-1, a candidate for both CRAF and Rosetta (CNSR) missions. The temperature at a depth of 10 m is approx. 160 K for all models considered and, hence, the ice at this depth is crystalline. A crystalline ice layer 40 to 240 m thick was found to overly the gas-laden amorphous ice. Consequently, it should be difficult for the probes of the two comet missions to sample pristine amorphous ice, unless they are aimed at the bottom of an active crater.

29287 (N-90-16607, pp. 8) **On the isotope analysis of cometary dust.** Begemann, F. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR-184821;NAS-1.26:184821;LPI-CONTRIB-691;CONF-890195-: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

It is thought that comets are an intimate mixture of ices and sub-micron to pebble sized silicates. Based on experience with carbonaceous chrondrites, part of the smallest grains are expected to be primary condensates carrying the unadulterated isotopic signature of their place of origin. In order to extract this information a grain-by-grain analysis will be necessary.

29288 (N-90-16607, pp. 9-10) **Direct determination of the morphology, structure and composition of cometary and interstellar ice analogs in the laboratory.** Blake, D.F.; Allamandola, L.J. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR-184821;NAS-1.26:184821;LPI-CONTRIB-691;CONF-890195-: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Abstract Only.

Ices of various kinds (H_2O, CO, CO_2, CH_4, NH_3, CH_3OH, etc.) comprise a volumetrically significant proportion of objects in the solar system (comets, outer planets, planetary rings, satellites) as well as in interstellar space (astrophysical ices). The refinement of analytical electron microscopy (AEM) procedures for storing, preparing and analyzing ices and other materials at cryogenic temperatures is discussed. These procedures will be essential to the successful analysis of returned comet nucleus samples.

29289 (N-90-16607, pp. 11) **Electron beam analysis of particulate cometary material.** Bradley, J. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR-184821;NAS-1.26:184821;LPI-CONTRIB-691;CONF-890195-: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Abstract Only.

Electron microscopy will be useful for characterization of inorganic dust grains in returned comet nucleus samples. The choice of instrument(s) will depend primarily on the nature of the samples, but ultimately a variety of electron-beam methods could be employed. Scanning and analytical (transmission) electron microscopy are the logical choise for morphological, mineralogical, and bulk chemical analyses of dust grains removed from ices. It may also be possible to examine unmelted ice/dust mixtures using an environmental scanning electron microscope equipped with a cryotransfer unit and a cold stage. Electron microscopic observations of comet nuclei might include: (1) porosities of dust grains; (2) morphologies and microstructures of individual mineral grains; (3) relative abundances of olivine, pyroxene, and glass; and (4) the presence of phases that might have resulted from aqueous alteration (layer silicates, carbonates, sulfates).

29290 (N-90-16607, pp. 12) **Thermal and chemical processing of the outermost layer of cometary nuclei.** Campins, H. (Arizona Univ., Tucson (USA)); Krider, E.P. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR-184821;NAS-1.26:184821;LPI-CONTRIB-691;CONF-890195-: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

A non-equilibrium mechanism that may produce substantial thermal and chemical processing of the outermost layer of cometary nuclei is proposed. If this phenomenon does occur, its effects will impact the interpretation of results from the CNSR and CRAF missions.

29291 (N–90-16607, pp. 13-14) **The carbon chemistry of meteorites: Relationships to comets.** Chang, S. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The carbonaceous meteorites exhibiting alteration by liquid water bear a strong relationship to comets. Not only is their elemental composition closer to solar in relative abundances than other meteorites, they are water rich; and they contain isotopic compositions among refractory and volatile elements indicative of presolar components. Some of these isotopic anomalies occur in organic compounds and carbonaceous grains signifying the presence of discrete and identifiable carbon components derived from interstellar and circumstellar matter. Insofar as comets and meteorites are ultimately formed from interstellar gas and dust, and comets have been subjected to considerably less aqueous and thermal evolution than carbonaceous meteorites, the interstellar imprint should be much stronger and better preserved in comets.

29292 (N–90-16607, pp. 15) **Laboratory analyses of micron-sized solid grains: Experimental techniques and recent results.** Colangeli, L. (Lecce Univ. (Italy)); Bussoletti, E.; Blanco, A.; Borghesi, A.; Fonti, S.; Orofino, V.; Schwehm, G. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Morphological and spectrophotometric investigations have been extensively applied in the past years to various kinds of micron and/or submicron-sized grains formed by materials which are candidate to be present in space. The samples are produced in the laboratory and then characterized in their physio-chemical properties. Some of the most recent results obtained on various kinds of carbonaceous materials are reported. Main attention is devoted to spectroscopic results in the VUV and IR wavelength ranges, where many of the analyzed samples show typical fingerprints which can be identified also in astrophysical and cometary materials. The laboratory methodologies used so far are also critically discussed in order to point out capabilities and present limitations, in the view of possible application to returned comet samples. Suggestions are given to develop new techniques which should overcome some of the problems faced in the manipulation and analysis of micron solid samples.

29293 (N–90-16607, pp. 16-17) **Analysis of organic compounds in returned comet nucleus samples.** Cronin, J.R. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Techniques for analysis of organic compounds in returned comet nucleus samples are described. Interstellar, chondritic and transitional organic components are discussed. Appropriate sampling procedures will be essential to the success of these analyses. It will be necessary to return samples that represent all the various regimes found in the nucleus, e.g., a complete core, volatile components (deep interior), and crustal components (surface minerals, rocks, processed organics such as macromolecular carbon and polymers). Furthermore, sampling, storage, return, and distribution of samples must be done under conditions that preclude contamination of the samples by terrestrial matter.

29294 (N–90-16607, pp. 18-19) **Non-equilibrium chemistry in the solar nebula and early solar system: Implications for the chemistry of comets.** Fegley, B. Jr. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Theoretical models of solar nebula and early solar system chemistry which take into account the interplay between chemical, physical, and dynamical processes have great utility for deciphering the origin and evolution of the abundant chemically reactive volatiles (H, O, C, N, S) observed in comets. In particular, such models are essential for attempting to distinguish between presolar and solar nebula products and for quantifying the nature and duration of nebular and early solar system processing to which the volatile constituents of comets have been subjected. The diverse processes and energy sources responsible for chemical processing in the solar nebula and early solar system are discussed. The processes considered include homogeneous and heterogeneous thermochemical and photochemical reactions, and disequilibration resulting from fluid transport, condensation, and cooling whenever they occur on timescales shorter than those for chemical reactions.

29295 (N–90-16607, pp. 22-23) **From interstellar dust to comets.** Greenberg, J.M. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The bulk and microstructure of comet nuclei are derived from the morphological structure and chemical composition of submicron sized interstellar dust grains which have undergone cold aggregation in the pre-solar nebula. The evolutionary picture of dust which is emerging is a cyclic one in which the particles, before being destroyed or going into solar system bodies, find themselves during their 5 billion year lifetime alternately in diffuse clouds and in molecular clouds. A small silicate core captured within a molecular cloud accretes various ices and gradually builds up an inner mantle of organic refractory material which has been produced by photoprocessing of the volatile ices. Clumps of grains form, and then clumps of clumps, and so on, until finally we reach the size of the comet nucleus.

29296 (N–90-16607, pp. 24-25) **Modifications of comet materials by the sublimation process: Results from simulation experiments.** Gruen, E. (Muenster Univ. (Germany, F.R.)); Bar-Nun, A.; Lammerzahl, P.; Klinger, J.; Kochan, H.; Keller, H.U.; Neukum, G.; Roessler, K.; Stoeffler, D.; Spohn, T. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

An active comet like comet Halley loses by sublimation a surface layer of the order of 1 m thickness per perihelion passage. In situ measurements show that water ice is the main constituent which contributes to the gas emission although even more volatile species (CO, NH_3, CH_4, CO_2 etc.) have been identified. Dust particles which were embedded in the ices are carried by the sublimating gases. Measurements of the chemical composition of cometary grains indicate that they are composed of silicates of approximate chondritic composition and refractory carbonaceous material. Comet simulation experiments show that significant modifications of cometary materials occur due to sublimation process in near surface layers which have to be taken into account in order to derive the original state of the material.

29297 (N–90-16607, pp. 26-27) **Comments on comet shapes and aggregation processes.** Hartmann, W.K. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

An important question for a comet mission is whether comet nuclei preserve information clarifying aggregation processes of planetary matter. New observational evidence shows that Trojan asteroids, as a group, display a higher fraction of highly-elongated objects than the belt. More recently evidence has accumulated that comet nuclei, as a group, also display highly-elongated shapes at macro-scale. This evidence comes from the several comets whose

nuclear lightcurves or shapes have been well studied. Trojans and comet nuclei share other properties. Both groups have extremely low albedos and reddish-to neutral-black colors typical of asteroids of spectral class D, P, and C. Both groups may have had relatively low collision frequencies. An important problem to resolve with spacecraft imaging is whether these elongated shapes are primordial, or due to evolution of the objects. Two hypotheses that might be tested by a combination of global-scale and close-up imaging from various directions are: (1) The irregular shapes are primordial and related to the fact that these bodies have had lower collision frequencies than belt asteroids; or (2) The irregular shapes may be due to volatile loss.

29298 (N–90-16607, pp. 28-29) **Cosmogenic nuclides in cometary materials: Implications for rate of mass loss and exposure history.** Herzog, G.F. (Los Alamos National Lab., NM (USA)); Englert, P.A.J.; Reedy, R.C. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

As planned, the Rosetta mission will return to earth with a 10-kg core and a 1-kg surface sample from a comet. The selection of a comet with low current activity will maximize the chance of obtaining material altered as little as possible. Current temperature and level of activity, however, may not reliably indicate previous values. Fortunately, from measurements of the cosmogenic nuclide contents of cometary material, one may estimate a rate of mass loss in the past and perhaps learn something about the exposure history of the comet. Perhaps the simplest way to estimate the rate of mass loss is to compare the total inventories of several long-lived cosmogenic radionuclides with the values expected on the basis of model calculations. Although model calculations have become steadily more reliable, application to bodies with the composition of comets will require some extension beyond the normal range of use. In particular, the influence of light elements on the secondary particle cascade will need study, in part through laboratory irradiations of volatile-rich materials. In the analysis of cometary data, it would be valuable to test calculations against measurements of short-lived isotopes.

29299 (N–90-16607, pp. 30) **Morphology and compositional differentiation of the surface of comets.** Huebner, W.F.; Boice, D.C. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The spacecraft missions to Comet Halley gave us the first detailed view of a comet nucleus. What was suspected before, that the nucleus surface was heterogeneous, was confirmed. The Halley Multicolor Camera aboard Giotto recorded jet-like dust features emanating from active regions covering approximately 15 percent of the surface that were responsible for emitting most of the dust and gas. An intensity gradient across the nucleus originating at the active areas and falling off to the darker, inactive region on the night side is caused by small particles that are more easily entrained by surface winds than larger particles that tend to remain in the jets. Data from the PIA (Giotto) and PUMA (Vega 1,2) instruments indicate that the smallest dust particles are enriched with organics (CHON particles). Some of this fine dust gravitationally settles creating a thin surface layer rich in organics. Particularly strong dust jets may cause wind-blown surface structures over inactive areas, such as, leeward dust accumulation behind hills. At close heliocentric distances the fine dust may be sintered on the surface.

29300 (N–90-16607, pp. 32) **Radiation modification of cometary materials: Laboratory simulations.** Johnson, R.E. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Cosmic rays and solar photons can modify precometary materials, comet surfaces, and ejected cometary materials. This can be of importance for describing the primordial crust of a comet, the composition of the ejected dust, and the degradation of the dust in the solar environment. The laboratory results of interest to radiation modification of materials, the effects of radiation on cometary materials and the relevance of these materials for comet surface analysis, are described.

29301 (N–90-16607, pp. 33-34) **Sulfur compounds in comets.** Kim, S.; Ahearn, M. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Cometary atmospheres exhibit abundant sulfur and sulfur compounds, which are absent in planetary atmospheres. Sulfur compounds were also detected in interstellar media, including SO, SO_2, CS, etc., but excluding S_2 which was identified only in IRAS-Araki-Alcock 1983d. Fluorescence calculations are used to analyze the B-X system of S_2 which appeared in IUE and ground-based spectra of IRAS-Araki-Alcock 1983d. Single- and multiple-cycle fluorescence calculations indicate that fluorescent equilibrium accounts for the observed spectra despite the fact that the S_2 lifetime against solar ultraviolet radiation is relatively short. This analysis confirms unambiguously that emission peaks in the 3000 to 4000 A spectral range of the ground-based data are due to the B-X bands of S_2. New evidence is presented of at least one S_2 outburst before it was detected by A'Hearn, Feldman, and Schleicher. The time variation of S_2 outgassing rates and discussion on the correlation between solar wind flux and the S_2 outbursts will be presented.

29302 (N–90-16607, pp. 35) **Organic chemistry of cometary dust as derived from PUMA 1 data.** Kissel, J. (Ingenieurbuero Krueger, Darmstadt (Germany, F.R.)); Krueger, F.R. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Onboard the Halley Fly-By spacecrafts Vega 1, Vega 2, and Giotto were the dust impact mass spectrometers PUMA 1, PUMA 2, and PIA respectively. PUMA 1 was the most sensitive instrument among them. From its data the occurrence of masslines greater than 60 Daltons could be shown to be statistically significant. An analysis of these masslines lead to a scenario, which could explain the masslines as fragment ions from larger molecules which characterize the chemical nature of cometary organic matter as: (1) highly unsaturated hydrocarbons; (2) some of them containing oxygen; (3) less containing nitrogen; and (4) a few containing oxygen and nitrogen as heteroatoms. From the properties of the spectrometer, also some physical parameters of the dust particles could be inferred, such as their density and structure.

29303 (N–90-16607, pp. 38-39) **Spectrophotometric observations of comet P/Giacobini-Zinner.** Konno, I. (Arizona State Univ., Tempe (USA)); Wyckoff, S.; Wehinger, P.A. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Spectroscopic observations of the Giacobini-Zinner comet were performed on March 20, June 20 and 21, September 11, and October 19, 1985. The September observations were performed at perihelion, exactly at the time of the International Cometary Explorer (ICE) encounter with the comet. The March and June observations were obtained with an intensified image dissector scanner (IIDS) on the 2.1-meter Kitt Peak telescope and the September and the October observations were obtained with a charge-coupled device (CCD) on the 4-meter Kitt Peak telescope. The nucleus spectra from these observations are presented.

29304 (N–90-16607, pp. 40) **Composition of dust from Comet P/Halley: The mineral fraction.** Langevin, Y. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The composition of dust from Comet Halley was investigated in situ during the Vega 1, Vega 2, and Giotto encounters by the PIA/PUMA impact mass spectrometers. More than 5000 meaningful spectra of individual dust particles were obtained, most in a compressed mode. The interpretation of these spectra in terms of elemental and mineralogical composition will be discussed. Accounting for these difficulties, the following conclusions can be derived for the mineral fraction of dust particles: (1) the observed compositions are compatible with the full range of observed meteoritic minerals (in particular mafic silicates, plagioclases, sulfides, oxides); and (2) within each mineralogical class, the spread in composition appears much wider and more uniform than in meteorites. The low overall density and very large excess of light elements will be discussed. These first direct results on cometary dust considerably strengthen the case for a comet sample return mission.

29305 (N–90-16607, pp. 43-44) **Prompt Gamma Activation Analysis (PGAA): Technique of choice for nondestructive bulk analysis of returned comet samples.** Lindstrom, D.J. (National Inst. of Standards and Technology, Gaithersburg, MD (USA)); Lindstrom, R.M. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Prompt gamma activation analysis (PGAA) is a well-developed analytical technique. The technique involves irradiation of samples in an external neutron beam from a nuclear reactor, with simultaneous counting of gamma rays produced in the sample by neutron capture. Capture of neutrons leads to excited nuclei which decay immediately with the emission of energetic gamma rays to the ground state. PGAA has several advantages over other techniques for the analysis of cometary materials: (1) It is nondestructive; (2) It can be used to determine abundances of a wide variety of elements, including most major and minor elements (Na, Mg, Al, Si, P, K, Ca, Ti, Cr, Mn, Fe, Co, Ni), volatiles (H, C, N, F, Cl, S), and some trace elements (those with high neutron capture cross sections, including B, Cd, Nd, Sm, and Gd); and (3) It is a true bulk analysis technique. Recent developments should improve the technique's sensitivity and accuracy considerably.

29306 (N–90-16607, pp. 45-46) **Solar nebula condensates and the composition of comets.** Lunine, J.I. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Interpretation of the volatile abundances in Halley's comet in terms of models for chemical and physical processes in the solar nebula are discussed. Key ratios of the oxidized and reduced species of nitrogen and carbon are identified which tell something of the chemical history of the environment in which cometary grains accreted to form the nucleus. Isotopic abundances are also applied to this problem. It will be shown that the abundances of methane and carbon monoxide are consistent both with models of solar nebula chemistry and chemical processing on grains in star-forming regions. Ultimately, limitations of the current data set on molecular abundances in comets and star-forming regions prevent a definitive choice between the two. Processes important to the composition of outer solar system bodies are: (1) gas phase chemistry in the solar nebula; (2) imperfect mixing in the solar nebula; (3) condensation; (4) clathration; (5) adsorption; and (6) processing of interstellar material.

29307 (N–90-16607, pp. 47) **Candidate sample acquisition systems for the Rosetta.** Magnani, P.G. (Tecnomare S.p.A. (Italy)); Gerli, C.; Colombina, G.; Vielmo, P. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The Comet Nucleus Sample Return (CNSR) mission, one of the four cornerstones of the ESA scientific program, is one of the most complex space ventures within the next century, both from technological and deep space exploration point of view. In the Rosetta scenario the sample acquisition phase represents the most critical point for the global mission's success. The proposed paper illustrates the main results obtained in the context of the CNSR-SAS ongoing activity. The main areas covered are related to: (1) sample properties characterization (comet soil model, physical/chemical properties, reference material for testing); (2) concepts identification for coring, shovelling, harpooning and anchoring; (3) preferred concept (trade off among concepts, identification of the preferred configuration); and (4) proposed development activity for gaining the necessary confidence before finalizing the CNSR mission. Particular emphasis will be given to the robotic and flexibility aspects of the identified sample acquisition systems (SAS) configuration, intended as a means for the overall system performance enhancement.

29308 (N–90-16607, pp. 48-49) **Interstellar and cometary dust.** Mathis, J.S. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Aspects of interstellar dust which are known from direct observation will be discussed. Some specific difficulties that various theories have in explaining the observations will be presented. Several theoretical interpretations which have been advanced will be discussed, highlighting first their similarities and then their differences. Also discussed will be the author's ideas about the conditions of interstellar dust throughout its life cycle, from origin to incorporation in pre-cometary ices. Dust is primarily observed by its effects on the spectra of background stars, so observations at optical and ultraviolet (UV) wavelengths are confined to the diffuse interstellar medium (ISM) or to the outer regions of dense clouds. Within this somewhat limited range of environments there are very few lines of sight which show any evidence for icy mantles, but there are major variations in the wavelength dependence of the extinction. In the infrared region of the spectrum, it is possible to observe a few stellar sources deeply embedded within molecular clouds.

29309 (N–90-16607, pp. 50-51) **The in-situ cometary particulate size distribution measured for one comet: P/Halley.** McDonnell, J.A.M.; Pankiewicz, G.S. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The close approach of Giotto to comet Halley during its 1986 apparition offered an opportunity to study the particulate mass distribution to masses of up to one gram. Data acquired by the front end channels of the highly sensitive mass spectrometer PIA and the dust shield detector system, DIDSY, provide definition to the detected distribution as close as 1000 km to the nucleus. Dynamic motion of the particulates after emission leads to a spatial differentiation affecting the size distribution in several forms: (1) ejecta velocity dispersion; (2) radiation pressure; (3) varying heliocentric distance; and (4) anisotropic nucleus emission. Transformation of the in-situ distribution from PIA and DIDSY weighted heavily by the near-nucleus fluxes leads to a presumed nucleus distribution. The data lead to a puzzling distribution at large masses, not readily explained in an otherwise monotonous power law distribution. Although temporal changes in nucleus activity could and do modify the in-situ size distribution, such an explanation is not wholly possible, because the same form is observed at differing locations in the coma where the time of flight from the nucleus greatly varies. Thus

neither a general change in comet activity nor spatial variations lead to a satisfactory explanation.

29310 (N–90-16607, pp. 54-55) **The comet rendezvous asteroid flyby mission.** Morrison, D. (Jet Propulsion Lab., Pasadena, CA (USA)); Neugebauer, M.; Weissman, P.R. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The Comet Rendezvous Asteroid Flyby (CRAF) mission is designed to answer the many questions raised by the Halley missions by exploring a cometary nucleus in detail, following it around its orbit and studying its changing activity as it moves closer to and then away from the Sun. In addition, on its way to rendezvous with the comet, CRAF will fly by a large, primitive class main belt asteroid and will return valuable data for comparison with the comet results. The selected asteroid is 449 Hamburga with a diameter of 88 km and a surface composition of carbonaceous chondrite meteorites. The expected flyby date is January, 1998. The CRAF spacecraft will continue to make measurements in orbit around the cometary nucleus as they both move closer to the Sun, until the dust and gas hazard becomes unsafe. At that point the spacecraft will move in and out between 50 and 2,500 kilometers to study the inner coma and the cometary ionosphere, and to collect dust and gas samples for onboard analysis. Following perihelion, the spacecraft will make a 50,000 km excursion down the comet's tail, further investigating the solar wind interaction with the cometary atmosphere. The spacecraft will return to the vicinity of the nucleus about four months after perihelion to observe the changes that have taken place. If the spacecraft remains healthy and adequate fuel is still onboard, an extended mission to follow the comet nucleus out to aphelion is anticipated.

29311 (N–90-16607, pp. 56-57) **Measurements of long-lived cosmogenic nuclides in returned comet nucleus samples.** Nishiizumi, K.; Kohl, C.P.; Arnold, J.R. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Measurements of long lived cosmic ray produced radionuclides have given much information on the histories and rates of surface evolution for meteorites, the Moon and the Earth. These nuclides can be equally useful in studying cometary histories and post nebular processing of cometary surfaces. The concentration of these nuclides depends on the orbit of the comet (cosmic ray intensity changes with distance from the sun), the depth of the sampling site in the comet surface, and the rate of continuous evolution of the surface (erosion rate of surface materials). If the orbital parameters and the sampling depth are known, production rates of cosmogenic nuclides can be fairly accurately calculated by theoretical models normalized to measurement on lunar surface materials and meteoritic samples. Due to the continuous evaporation of surface materials, it is expected that the long lived radioactivities will be undersaturated. Accurate measurements of the degree of undersaturation in nuclides of different half-lives allows for the determination of the rate of surface material loss over the last few million years.

29312 (N–90-16607, pp. 58) **Metamorphism of cosmic dust: Processing from circumstellar outflows to the cometary regolith.** Nuth, J.A. III. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Metamorphism of refractory particles continues in the interstellar medium (ISM) where the driving forces are sputtering by cosmic ray particles, annealing by high energy photons, and grain destruction in supernova generated shocks. Studies of the depletion of the elements from the gas phase of the interstellar medium tell us that if grain destruction occurs with high efficiency in the ISM, then there must be some mechanism by which grains can be formed in the ISM. Most grains in a cloud which collapses to form a star will be destroyed; many of the surviving grains will be severely processed. Grains in the outermost regions of the nebula may survive relatively unchanged by thermal processing or hydration. It is these grains which one hopes to find in comets. However, only those grains encased in ice at low temperature can be considered pristine since a considerable degree of hydrous alteration might occur in a cometary regolith if the comet enters the inner solar system. The physical, chemical and isotopic properties of a refractory grain at each stage of its life cycle will be discussed.

29313 (N–90-16607, pp. 60-61) **What if chondritic porous interplanetary dust particles are not the real McCoy.** Rietmeijer, F.J.M. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

To select a target comet for a Comet Nucleus Sample Return Mission (CNSRM) it is necessary to have an experimental data base to evaluate the extent of diversity and similarity of comets. For example, the physical properties (e.g., low density) of chondritic porous (CP) interplanetary dust particles (IDPs) are believed to resemble these properties of cometary dust although it is yet to be demonstrated that the porous structure of CP IDPs is inherent to presolar dust particles stored in comet nuclei. Porous structures of IDPs could conceivably form during sublimation at the surface of active comet nuclei. Porous structures are also obtained during annealing of amorphous Mg-SiO smokes which initially forms porous aggregates of olivine + platey tridymite and which, upon continued annealing, react to fluffy enstatite aggregates. It is therefore uncertain that CP IDPs are entirely composed of unmetamorphosed presolar dust. Conceivably, new minerals and textures may form in situ in nuclei of active comets as a function of their individual thermal history. Unmetamorphosed comet dust is probably structurally amorphous. Thermal annealing of this dust can produce ultra fine-grained minerals and this ultrafine grain size of CP IDPs should be considered in assessments of aqueous alterations that could affect presolar dust in comet nuclei between 200 and 400 K. Devitrification and hydration may occur in situ in ice-dust mixtures and the mantle of active comet nuclei. Devitrification, or uncontrolled crystallization, of amorphous precursor dust can produce a range of chemical compositions of ultrafine-grained minerals and (non-equilibrium) mineral assemblages and textures in dust contained in comet nuclei as a function of period and trajectory of orbit and number of perihelion passages (not considering internal heating).

29314 (N–90-16607, pp. 62-63) **Handling and analysis of ices in cryostats and glove boxes in view of cometary samples.** Roessler, K. (Ruhr Univ., Bochum (Germany, F.R.)); Eich, G.; Heyl, M.; Kochan, H.; Oehler, A.; Patnaik, A.; Schlosser, W.; Schulz, R. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Comet nucleus sample return mission and other return missions from planets and satellites need equipment for handling and analysis of icy samples at low temperatures under vacuum or protective gas. Two methods are reported which were developed for analysis of small icy samples and which are modified for larger samples in cometary matter simulation experiments (KOSI). A conventional optical cryostat system was modified to allow for transport of samples at 5 K, ion beam irradiation, and measurement in an off-line optical spectrophotometer. The new system consists of a removable window plug containing nozzles for condensation of water and volatiles onto a cold finger. This plug can be removed in a vacuum system, changed against another plug (e.g., with other windows (IR, VIS, VUV) or other nozzles). While open, the samples can be treated under vacuum with cooling by manipulators (cut, removal, sample taking, irradiation with light, photons, or ions). After bringing the plug back, the samples can be moved to another site of analysis. For handling the 30 cm diameter mineral-ice samples

from the KOSI experiments an 80x80x80 cm glove box made out of plexiglass was used. The samples were kept in a liquid nitrogen bath, which was filled from the outside. A stream a dry N_2 and evaporating gas from the bath purified the glove box from impurity gases and, in particular, H_2O, which otherwise would condense onto the samples.

29315 (N–90-16607, pp. 64-65) **Trajectory-capture cell instrumentation for measurement of dust particle mass, velocity and trajectory, and particle capture.** Simpson, J.A.; Tuzzolino, A.J. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The development of the polyvinylidene fluoride (PVDF) dust detector for space missions–such as the Halley Comet Missions where the impact velocity was very high as well as for missions where the impact velocity is low was extended to include: (1) the capability for impact position determination - i.e., x,y coordinate of impact; and (2) the capability for particle velocity determination using two thin PVDF sensors spaced a given distance apart - i.e., by time-of-flight. These developments have led to space flight instrumentation for recovery-type missions, which will measure the masses (sizes), fluxes and trajectories of incoming dust particles and will capture the dust material in a form suitable for later Earth-based laboratory measurements. These laboratory measurements would determine the elemental, isotopic and mineralogical properties of the captured dust and relate these to possible sources of the dust material (i.e., comets, asteroids), using the trajectory information. The instrumentation described here has the unique advantages of providing both orbital characteristics and physical and chemical properties–as well as possible origin–of incoming dust.

29316 (N–90-16607, pp. 66-67) **Thermal histories of the samples of two KOSI comet nucleus simulation experiments.** Spohn, T. (Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Cologne (Germany, F.R.)); Benkhoff, J.; Klinger, J.; Gruen, E.; Kochan, H. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Temperatures recorded during two KOSI comet nucleus simulation experiments strongly suggest that heat transport by vapor flow into the interior of the sample is very important. Two comet nucleus simulation experiments have been done by the KOSI team in a big space simulator. The thermal evolution of the sample during insolation and the results of simplified thermal evolution calculations are discussed. The observed thermal histories cannot be explained by a simple model with heat transferred by heat conduction at a constant conductivity, so a coupled heat and mass transfer problem was considered. The porous ice matrix was assumed to have a constant thermal conductivity and to be in thermal equilibrium with vapor in the pores, the internal pressure being the vapor pressure. The vapor was modelled as an ideal gas because, at the temperatures relevant to the problem, the mean free path length of the vapor molecules is large in comparison with the pore dimensions. The heat capacity at constant volume per unit mass of the two phase mixture was also assumed constant. The vapor was allowed to flow and transfer heat in response to an internal pressure gradient.

29317 (N–90-16607, pp. 68-69) **Analysis of particulates of comet nucleus samples: Possible use of olivine as indicator phase.** Steele, I.M. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The electron microprobe is a proven instrument for particulate analysis and modifications are possible for in situ analysis of particulates in ice at temperatures near that of liquid nitrogen. Present sample requirements allow for polished samples with 0.25 x 0.25 dimensions to be maintained in the sample chamber of a modern electron probe (CAMECA SX-50) at a temperature of -150 C; larger samples are possible but at higher temperatures as determined by thermal conductivity. The major problem is transport and insertion of samples into the instrument through vacuum interlocks. The manufacturer of the above microprobe has designed an exchange mechanism to allow storage and transport of samples previously prepared for their sample holder which attaches to their instrument allowing extraction and insertion of samples while maintaining -150 C temperature. An important test will be the capability of preparing polished surfaces of an ice-particulate sample without loss of particles and at low temperatures. While thin sections of water ice are routine, these are not examined for particulate material and are prepared at temperatures easily obtained in room-size volumes. Anticipated problems include rounding of small grains in the relatively soft ice matrix and the technical problem of dry polishing.

29318 (N–90-16607, pp. 70) **The nature of cometary materials.** Stephens, J. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Because cometary surfaces are likely to be far colder and of a different composition than planetary surfaces, there are some new considerations that must be examined in regards to placing instrumented packages or sample return devices on their surfaces. The qualitative analysis of the problem of attaching hardware to a comet and not being ejected back into space can be divided into two parts. The first problem is to pierce the mantle and obtain access to the icy core. Drilling through the mantle requires that the drilling forces be reacted. Reacting such forces probably requires attachment to the icy core below. Therefore, some kinetic impact piercing device is likely to be required as the first act of attachment. The second problem for a piercing device to overcome is the force produced by the impact kinetic energy that tries to eject the piercing device back into space. The mantle and icy core can absorb some of the impact kinetic energy in the form of fracture formation and friction energy. The energy that is not absorbed in these two ways is stored by the core as elastic deformation of the mantle and icy core. It is concluded that because the cometary materials are almost certainly brittle and the icy core is likely to be self lubricating, the elastic rebound and gas pressure expulsion forces must be counteracted by forces greater than those that may be provided by a piercing device or its capture devices (barbs).

29319 (N–90-16607, pp. 71-72) **Methods for the mineralogical and textural analysis of comet nucleus samples.** Stoeffler, D.; Dueren, H.; Knoelker, J. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The objectives and instrumental requirements of a petrographic analysis of porous comet nucleus material are reviewed. Assumptions about its composition and texture, and the available techniques for the microscopic analysis of comet analogue material are investigated. New techniques required for the petrographic investigation of natural and artificial comet nucleus samples are also considered.

29320 (N–90-16607, pp. 73-74) **Non-destructive trace element microanalysis of as-received cometary nucleus samples using synchrotron x ray fluorescence.** Sutton, S.R. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The Synchrotron X ray Fluorescence (SXRF) microprobe at the National Synchrotron Light Source (NSLS), Brookhaven National Laboratory, will be an excellent instrument for non-destructive trace

element analyses of cometary nucleus samples. Trace element analyses of as-received cometary nucleus material will also be possible with this technique. Bulk analysis of relatively volatile elements will be important in establishing comet formation conditions. However, as demonstrated for meteorites, microanalyses of individual phases in their petrographic context are crucial in defining the histories of particular components in unequilibrated specimens. Perhaps most informative in comparing cometary material with meteorites will be the halogens and trace metals. In-situ, high spatial resolution microanalyses will be essential in establishing host phases for these elements and identifying terrestrial (collection/processing) overprints. The present SXRF microprobe is a simple, yet powerful, instrument in which specimens are excited with filtered, continuum synchrotron radiation from a bending magnet on a 2.5 GeV electron storage ring. A refrigerated cell will be constructed to permit analyses at low temperatures. The cell will consist essentially of an air tight housing with a cold stage. Kapton windows will be used to allow the incident synchrotron beam to enter the cell and fluorescent x rays to exit it. The cell will be either under vacuum or continuous purge by ultrapure helium during analyses. Several other improvements of the NSLS microprobe will be made prior to the cometary nucleus sample return mission that will greatly enhance the sensitivity of the technique.

29321 (N–90-16607, pp. 75-76) **Mechanical and SEM analysis of artificial comet nucleus samples.** Thiel, K. (Kernforschungsanlage, Juelich (Germany, F.R.)); Kochan, H.; Roessler, K.; Gruen, E.; Schwehm, G.; Hellmann, H.; Hsiung, P.; Koelzer, G. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Since 1987 experiments dealing with comet nucleus phenomena have been carried out in the DFVLR space simulation chambers. The main objective of these experiments is a better understanding of thermal behavior, surface phenomena and especially the gas dust interaction. As a function of different sample compositions and exposure to solar irradiation (xenon-bulbs) crusts of different hardness and thickness were measured. The measuring device consists of a motor driven pressure foot (5 mm diameter), which is pressed into the sample. The applied compressive force is electronically monitored. The microstructure of the crust and dust residuals is investigated by scanning electron microscopy (SEM) techniques. Stress-depth profiles of an unirradiated and an irradiated model comet are given.

29322 (N–90-16607, pp. 77-78) **Electron Spin Resonance (ESR) studies of returned comet nucleus samples.** Tsay, Fundow; Kim, S.S.; Liang, R.H. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The most important objective of the Comet Nucleus Sample Return Mission is to return samples which could reflect formation conditions and evolutionary processes in the early solar nebula. It is expected that the returned samples will consist of fine-grained silicate materials mixed with ices composed of simple molecules such as H_2O, NH_3, CH_4 as well as organics and/or more complex compounds. Because of the exposure to ionizing radiation from cosmic-ray, gamma-ray, and solar wind protons at low temperature, free radicals are expected to be formed and trapped in the solid ice matrices. The kind of trapped radical species together with their concentration and thermal stability can be used as a dosimeter as well as a geothermometer to determine thermal and radiation histories as well as outgassing and other possible alternation effects since the nucleus material was formed. Since free radicals that are known to contain unpaired electrons are all paramagnetic in nature, they can be readily detected and characterized in their native form by the Electron Spin Resonance (ESR) method. In fact, ESR has been shown to be a non-destructive, highly sensitive tool for the detection and characterization of paramagnetic, ferromagnetic, and radiation damage centers in terrestrial and extraterrestrial geological samples. The potential use of ESR as an effective method in the study of returned comet nucleus samples, in particular, in the analysis of fine-grained solid state icy samples is discussed.

29323 (N–90-16607, pp. 79-80) **Ion bombardment experiments suggesting an origin for organic particles in pre-cometary and cometary ices.** Wdowiak, T.J.; Robinson, E.L.; Flickinger, G.C.; Boyd, D.A. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

During the Giotto and Vega encounters with Comet Halley both organic particles called CHON and energetic ions were detected. The acceleration of ions to hundreds of keV in the vicinity of the bow shock and near the nucleus may be a demonstration of a situation occurring in the early solar system (perhaps during the T Tauri stage) that led to the formation of organic particles only now released. Utilizing a Van de Graaff accelerator and a target chamber having cryogenic and mass spectrometer capabilities, frozen gases were bombarded at 10 K with 175 keV protons with the result that fluffy solid material remains after sublimation of the ice. Initial experiments were carried out with a gas mixture in parts of 170 carbon monoxide, 170 argon, 25 water, 20 nitrogen, and 15 methane formulated to reflect an interstellar composition in experiments involving the freezing out of the products of a plasma. The plasma experiments resulted in a varnish-like film residue that exhibited luminescence when excited with ultraviolet radiation, while the ion bombardment created particulate material that was not luminescent.

29324 (N–90-16607, pp. 81-82) **Physical processing of cometary nuclei.** Weissman, P.R. (Colorado Univ., Boulder (USA)); Stern, S.A. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Cometary nuclei were formed far from the Sun in the colder regions of the solar nebula, and have been stored in distant orbits in the Oort cloud over most of the history of the solar system. It had been thought that this benign environment would preserve comets in close to their original pristine state. However, recent studies have identified a number of physical processes that have likely acted to modify cometary nuclei in a variety of significant ways. It is important to consider all of these possible processes, both in deciding on a site on the nucleus for collection of cometary samples, and in interpreting the results of analyses of returned cometary samples. Although it can no longer be said that comets are pristine samples of original solar nebula material, they are still the best obtainable samples of that unique period in the formation of the planetary system.

29325 (N–90-16607, pp. 84-85) **Refractory solids in chondrites and comets: How similar.** Wood, J.A. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

The grains of ice, dust, and organic material that came together to form the solar system have been preserved to differing degrees in the most primitive solar system bodies, asteroids and comets. The study of samples of asteroids (in the form of chondritic meteorites) reveals that the dust component was extensively altered by high-temperature events and processes in the early solar system, before it was aggregated into chondritic planetesimals. The nature of these high-temperature events and processes is not known, but the evidence of their operation is pervasive and unequivocal. Are the refractory particles in comets likely to be similar to these chondrite components. Probably not (except for the presolar carbonaceous grains in chondrites), because the chondritic components are products of severe thermal processing, and all

imaginable energy sources that could have provided the heat tend to diminish with distance from the sun. Every indication is that comets formed at much greater radial distances than asteroids, so the particles they incorporated would have experienced less heating. The possibilities cannot be completely ruled out that comets, too, formed inside the present orbit of Jupiter, or that thermally-processed grains were able to diffuse great radial distances before being incorporated in accreting objects, but it is far more likely that most of the refractory grains in comets have been spared the extreme thermal processing that shaped the character of chondritic components.

29326 (N–90-16607, pp. 86-87) **Isotopic microanalysis of returned comet nucleus samples.** Zinner, E. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

If isotopic measurements of interplanetary dust particles (IDPs) and primitive meteorites can serve as a guide to the isotopic analysis of returned comet nucleus material, an essential requirement will be the capability for microanalysis. The reason is that in both types of extraterrestrial samples large isotopic heterogeneities on a small spatial scale have become apparent once it was possible to measure isotopes in small samples. In the discovery of large isotopic anomalies the ion microprobe has played a significant role because of its high spatial resolution for isotopic ratio measurements. The largest isotopic anomalies in C, N, O, Mg, Si, Ca and Ti found to date were measured by ion microprobe mass spectrometry. The most striking examples are D/H measurements in IDPs and isotopic measurements of C, N and Si in SiC from the CM chondrites Murray and Murchison.

29327 (N–90-16607, pp. 88-89) **The measurement of trace elements in interplanetary dust and cometary particles by ultra-high sensitivity INAA.** Zolensky, M.E. (National Inst. of Standards and Technology, Gaithersburg, MD (USA)); Lindstrom, D.J.; Lindstrom, R.M.; Lindstrom, M.M. Lunar and Planetary Inst., Houston, TX (USA). 1989. (NASA-CR–184821;NAS–1.26:184821;LPI-CONTRIB–691;CONF-890195–: Workshop on the analysis of returned comet nucleus samples, Milpitas, CA (USA), 16-18 Jan 1989). In *Workshop on Analysis of Returned Comet Nucleus Samples.* Available from NTIS, PC A05/MF A01.

Today the major elemental composition of interplanetary dust particles (IDPs) is routinely determined in many laboratories. These and mineralogical studies have revealed the presence of at least two major types of IDPs, chondritic and refractory. Preliminary results of a successful attempt to determine abundances of a large suite of trace elements from both chondritic and refractory IDPs are reported. The analytical procedure can be used in the grain-by-grain analysis of returned cometary samples. Chondritic and refractory IDPs are characterized by standard scanning electron microscopy and energy dispersive x ray spectroscopy (SEM-EDX) techniques. With this system, detection limits for many elements are well below picogram levels, and some approach femtogram levels. This technique is non-destructive, although some sample handling is required, so particles can be analyzed by other techniques after instrument neutron activation analysis (INAA) is completed. Data is presently being reduced from the analyses of 7 IDPs. These are U2015E10, U2015F1, W7029-A2, W7029-A3, W7013A8, LACI (all chondritic) and 705 (refractory). So far, 17 different major and trace elements were detected and measured in these particles, including rare earths and some very volatile elements (Br and Zn).

29328 (N–90-16676) **Determination of solar flare accelerated ion angular distributions from SMM gamma ray and neutron measurements and determination of the He-3/H ratio in the solar photosphere from SMM gamma ray measurements. Final technical report, 1 July 1987-31 August 1989.** Lingenfelter, R.E. California Univ., La Jolla, CA (USA). Aug 1989. 7p. (NASA-CR–186038;NAS–1.26:186038). Available from NTIS, PC A02/MF A01.

Comparisons of Solar Maximum Mission (SMM) observations of gamma-ray line and neutron emission with theoretical calculation of their expected production by flare accelerated ion interactions in the solar atmosphere have led to significant advances in the understanding of solar flare particle acceleration and interaction, as well as the flare process itself. These comparisons have enabled the determination of, not only the total number and energy spectrum of accelerated ions trapped at the sun, but also the ion angular distribution as they interact in the solar atmosphere. The Monte Carlo program was modified to include in the calculations of ion trajectories the effects of both mirroring in converging magnetic fields and of pitch angle scattering. Comparing the results of these calculations with the SMM observations, not only the angular distribution of the interacting ions can be determined, but also the initial angular distribution of the ions at acceleration. The reliable determination of the solar photospheric He-3 abundance is of great importance for understanding nucleosynthesis in the early universe and its implications for cosmology, as well as for the study of the evolution of the sun. It is also essential for the determinations of the spectrum and total number of flare accelerated ions from the SMM/GRS gamma-ray line measurements. Systematic Monte Carlo calculations of the time dependence were made as a function of the He-3 abundance and other variables. A new series of calculations were compared for the time-dependent flux of 2.223 MeV neutron capture line emission and the ratio of the time-integrated flux in the 2.223 MeV line to that in the 4.1 to 6.4 MeV nuclear deexcitation band.

29329 (PB–90-148677/XAB) **Solar-Geophysical Data Number 542, October 1989. Part 2 (comprehensive reports). Data for April 1989 and miscellaneous.** Coffey, H.E. National Geophysical Data Center, Boulder, CO (USA). Oct 1989. 102p. (SGD–542-PT-2). Available from NTIS, PC A06/MF A01.

Contents: detailed index for 1989; data for April 1989 – solar flares, solar radio bursts at fixed frequencies, interplanetary solar particles and plasma, solar x-ray radiation from GOES satellite, mass ejections from the sun, active prominences and filaments; miscellaneous data – Meudon Carte synoptique carrington rotations 1811-1812, solar ultraviolet radiation Nimbus 7 November 1978-October 1984.

29330 (PB–90-858762/XAB) **Planetary volcanology. November 1972-January 1990 (A Bibliography from the International Aerospace Abstracts data base). Report for November 1972-January 1990.** National Technical Information Service, Springfield, VA (USA). Feb 1990. 88p. Available from NTISPC N01/MF N01.

U.S. sales only.

This bibliography contains citations concerning the causes and effects of volcanism on neighboring planets and their satellites. From Mars' relatively quiet nature to the violent activity on Jupiter's moon IO, these citations emphasize the current theories being developed on extra-terrestrial volcanism, especially where it applies to an understanding of Earth's own evolution, and to that of the solar system. (Contains 188 citations fully indexed and including a title list.)

29331 (PB–90-859844/XAB) **Sunspots: Solar-terrestrial interactions. September 1972-January 1990 (A Bibliography from the International Aerospace Abstracts data base). Report for September 1972-January 1990.** National Technical Information Service, Springfield, VA (USA). Feb 1990. 135p. Available from NTISPC N01/MF N01.

U.S. sales only.

This bibliography contains citations concerning the effects of sunspot activity on the Earth's magnetic field, atmosphere, and climate. Articles include experimental observations of solar-terrestrial effects correlating with sunspot activity; historical data in support of direct effects; and short- and long-term geomagnetic, atmospheric, and climatic effects of observed sunspot activity. Tree ring data, glacial measurements, ozone measurements, ocean floor coring, sea level changes, and other data are cited as examples of effects on Earth's environment caused by sunspot activity. (Contains 313 citations fully indexed and including a title list.)

29332 (RRK–89-30) **Teichmueller motion of (2+1)-dimensional gravity with the cosmological constant.** Fujiwara, Yoshihisa; Soda, Jiro. Hiroshima Univ., Takehara (Japan). Research Inst. for Theoretical Physics. Aug 1989. 27p. Order Number

DE90777745. Available from NTIS (US Sales Only), PC A03/MF A01.

The (2+1)-dimensional Einstein gravity with a cosmological constant is studied in the ADM canonical formalism. Adopting the York's time slice, we completely solve the initial-value problem and the time evolution equations with an initial spacelike 2-surface being a closed Riemann surface of genus zero and one. The result in a torus case is that the Teichmueller parameters for the torus follow a geodesic in the Teichmueller space but its motion asymptotically stops due to the presence of the cosmological constant. (author).

29333 (UCRL-JC–103348) **Update on the OPAL opacity code.** Rogers, F.J.; Iglesias, C.A.; Wilson, B.G. Lawrence Livermore National Lab., CA (USA). 23 Feb 1990. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-891052–2: Atomic processes in plasmas, Gaithersburg, MD (USA), 2-5 Oct 1989). Order Number DE90009946. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Persisting discrepancies between theory and observation in a number of astrophysical properties has led to the conjecture that opacity databases may be inaccurate. The OPAL opacity code has been developed to address this question. The physical basis of OPAL removes several of the approximations present in past calculations. For example, it utilizes a much larger and more detailed set of atomic data than was used to construct the Los Alamos Astrophysical Library. This data is generated online, in LS or intermediate coupling, from prefitted analytic effective potentials and is of similar quality as single configuration, relativistic, self-consistent-field calculations. The OPAL code has been used to calculate opacities for the solar core and for Cepheid variable stars. In both cases, significant increases in the opacity compared to the Los Alamos Astrophysical Library were found. 37 refs., 2 figs., 1 tab.

29334 On the Phase transition to spacetime in string cosmology. Axenides, M. (Univ. of Washington, Seattle (USA)). *General Relativity and Gravitation (USA),* 21(7): 659-664 (Jul 1989).

Closed string models have recently been constructed in lower than their critical spacetime dimensions D { <=} D_{cr}. An ideal gas of closed strings with D { >=} 4 undergoes a phase transition at a universal point (Hagedorn temperature). The authors argue that solitonic configurations on the string world-sheet (vortices) drive the system into a high-temperature phase where the vacuum is dominated by vortex condensates. Flat spacetime is identified with the dipole low-temperature phase of vortex antivortex pairs. This is a Kosterlitz-Thouless transition on the string world-sheet. It is suggestive of a stringy realization of the inflationary universe paradigm.

29335 (AD-A–216440/8/XAB) **Processing of DMSP magnetic data and its use in geomagnetic field modeling. Report for 1 October 1987-30 September 1989.** Ridgway, J.R.; Sabaka, T.J.; Chinn, D.; Langel, R.A. National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center. Nov 1989. 63p. (SCIENTIFIC–1). Available from NTIS, PC A04/MF A01.

The DMSP F-7 satellite is an operational Air Force meteorological satellite which carried a magnetometer for geophysical measurements. The magnetometer was located within the body of the spacecraft in the presence of large spacecraft fields. In addition to stray magnetic fields, the data have inherent position and time inaccuracies. Algorithms were developed to identify and remove time varying magnetic field noise from the data. Techniques developed for Magsat were then modified and used to attempt determination of the spacecraft fields, of any rotation between the magnetometer axes and the spacecraft axes, and of any scale changes within the magnetometer itself. The corrected data were then used to attempt to model the geomagnetic field. This was done in combination with data from Magsat, from the standard magnetic observatories, from aeromagnetic and other survey data, and from DE-2 spacecraft magnetic field data. The results obtained are inconsistent and contradictory. Characterization of the problem is clearest when model coefficients are compared between models with DMSP data only and models with other data types only. In that case the gl(1) term in the DMSP models is consistently lower in magnitude by 10-25 nT from the trend inferred from models based on other data.

29336 (AD-A–216626/2/XAB) **Three-dimensional cloud dynamics: Preliminary application to a HANE (High Altitude Nuclear Explosions) environment. Interim report.** Huba, J.D.; Drake, J.F.; Mulbrandon, M. Naval Research Lab., Washington, DC (USA). 30 Jan 1989. 31p. (NRL-MR–6391). Available from NTIS, PC A03/MF A01.

The Defense Nuclear Agency is sponsoring a broad-based research program on the dynamics and phenomenology of high altitude nuclear explosions (HANEs). An important goal of this research is to understand and model the late time nuclear environment; specifically, the intense field-aligned striations which are produced. These striations are regions of high electron density and are of military significance because they can adversely impact communication and surveillance systems. Of particular interest to DNA is the development of a model which characterizes the power spectral density of nuclear striations: the outer scale, the freezing scale, the inner scale, and the associated power law exponents between these scale sizes. This information provides a description of the late time nuclear environment which can be used in propagation codes relevant to military systems. This document describes 3D plasma cloud dynamics model of Drake et al. (1988) which is applied to barium clouds and to nuclear striations. Quantitative estimates of the critical scale size for marginal stability are presented. The implications of these results regarding the freezing of plasma striations are discussed.

29337 (AD-A–216755/9/XAB) **Critical evaluation of the AE indices.** Kroehl, H.W. National Oceanic and Atmospheric Administration, Boulder, CO (USA). Environmental Research Labs. 1989. 14p. Available from NTIS, PC A03/MF A01.

Pub. in Jnl. of Geomagnetism and Geoelectricity, Vol. 41, 317-329(1989).

The computation of the total eastward and westward auroral electrojets from numerical modeling techniques for three different intervals during disturbed conditions provides a unique opportunity to evaluate the accuracy of the standard Auroral Electrojet indices AU(12) and AL(12). The effect on the indices of replacing the local magnetic coordinate system with a global system, of increasing the latitudinal coverage by increasing the number of stations from 12 to 57, and of integrating the current density to obtain the total current is considered as new indices are correlated with the standard ones. We conclude that AL(12) is a reasonable measure of the westward electrojet current in a statistical sense, that Au(12) is not as good a measure of the eastward current, and that values of AU(12) and AL(12) during quiet conditions, i.e., less than 50 nT, must be treated separately from disturbed conditions. It should also be noted that a rotation of the perturbation vectors into a global coordinate system improves the indices more than an increase in the number of stations. Reprints. (rrh)

29338 (AD-A–216867/2/XAB) **Active probing of space plasmas. Final report, 25 October 1985-30 September 1989.** Chan, C.; Silevitch, M.B.; Villalon, E. Northeastern Univ., Boston, MA (USA). 1 Sep 1989. 110p. Available from NTIS, PC A06/MF A01.

During the course of the research period our efforts were focused on the following areas: (1) An examination of stochastic acceleration mechanisms in the ionosphere; (2) A study of nonequilibrium dynamics of the coupled magnetosphere - ionosphere system; and (3) Laboratory studies of active space experiments. Reprints include: Dynamics of charged particles in the near wake of a very negatively charged body – Laboratory experiment and numerical simulation; Laboratory study of the electron temperature in the near wake of a conducting body; New model for auroral breakup during substorms; Substorm breakup on closed field lines; New model for substorm on sets – The pre-breakup and triggering regimes; Model of the westward traveling surge and the generation of Pi 2 pulsations; Ionospheric electron acceleration by electromagnetic waves near regions of plasma resonances; Relativistic particle acceleration by obliquely propagating electromagnetic fields; Some consequences of intense electromagnetic wave injection into space plasmas.

29339 (CONF-8710514–1) **Quasineutral beam propagation in space.** Papadopoulos, K.; Mankofsky, A.; Drobot, A. Science Applications International Corp., McLean, VA (USA). [1987]. 37p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC03-85SF15935. From Chapman conference; Sendai (Japan); 12-16 Oct 1987. Order Number DE90009459. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The propagation of dense energetic neutralized ion beams or plasmoids injected into a plasma across the ambient magnetic field under ionospheric conditions is considered. Using a simple physical model supported by two-dimensional hybrid simulations, it is shown that think dense beams can propagate ballistically over lengths many times their gyroradius. This occurs when the following conditions are satisfied: $\Delta/R_o \ll 1$, where Δ is the cross field beam width and R_o the gyroradius of an ambient ion having a velocity equal to the beam velocity u_b, and $n_bM_b/n_oM_o \gg 1$, where $n_b(M_b)$, $n_o(M_o)$ are the density (mass) of beam and ambient ions. The scaling of the ballistic propagation lengths and times with beam and ambient parameters is presented along with comments on the applicability of the model to space and astrophysics. 13 refs., 19 figs., 1 tab.

29340 (LA-UR–90-906) **Hf propagation through actively modified ionospheres.** Argo, P.E. (Los Alamos National Lab., NM (USA)); Fitzgerald, T.J.; Wolcott, J.H.; Simons, D.J.; Warshaw, S.; Carlson, R. Los Alamos National Lab., NM (USA). [1990]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-9005150–1: Ionospheric effects symposium, Washington, DC (USA), 1-3 May 1990). Order Number DE90008931. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We have developed a computer modeling capability to predict the effect of localized electron density perturbations created by chemical releases or high-power radio frequency heating upon oblique, one-hop hf propagation paths. We have included 3-d deterministic descriptions of the depleted or enhanced ionization, including formation, evolution, and drift. We have developed a homing ray trace code to calculate the path of energy propagation through the modified ionosphere in order to predict multipath effects. We also consider the effect of random index of refraction variations using a formalism to calculate the mutual coherence functions for spatial and frequency separations based upon a path integral solution of the parabolic wave equation for a single refracted path through an ionosphere which contains random electron density fluctuations. 5 refs., 8 figs.

29341 Substorms, plasmoids, flux ropes, and magnetotail flux loss on March 25, 1983: CDAW 8. Fairfield, D.H. (Laboratory for Extraterrestrial Physics, NASA Goddard Space Flight Center, Greenbelt, Maryland (USA)); Baker, D.N.; Slavin, J.A.; Craven, J.D.; Frank, L.A.; Elphic, R.C.; Fennell, J.F.; Richardson, I.G. *Journal of Geophysical Research (USA)*, 94(A11): 15135-15152 (1 Nov 1989).

During a 9-hour period following a storm sudden commencement on March 25, 1983, six spacecraft near geosynchronous orbit, one over the pole, and three in the magnetotail monitored a complex sequence of magnetospheric variations. Magnetic field compressions associated with the sudden commencement were seen first by the three downtail spacecraft with increasing time delays that were consistent with the tailward movement of an interplanetary-shock- associated pressure enhancement. Ground magnetograms and synchronous orbit data are used to identify seven substorm intensifications during this geomagnetically active period. Six of these intensifications are clearly associated with tail lobe field decreases ~18 R_E behind the Earth. Four of these intensifications are followed by both B_z field increases in the tail lobes at ~18 and ~30 R_E and by the subsequent observation of rapidly flowing plasma sheet plasma at ISEE 3 ~110 R_E down the tail. During two substorms where DE 1 was optically observing the auroral oval, the area of the polar cap was observed to decrease as the tail lobe field decreased at 18 R_E. All these observations are consistent with the substorm-associated release of a plasmoid at a neutral line near 20 R_E; however, the classical north-south variation of the plasma sheet magnetic field thought to be characteristic of the passage of a plasmoid in the deep tail was not seen in every case. © American Geophysical Union 1989

29342 Electromagnetic instabilities in the plasma sheet boundary layer. Angelopoulos, V. (Department of Physics and Institute for Geophysics and Planetary Physics, University of California, Los Angeles (USA)); Elphic, R.C.; Gary, S.P.; Huang, C.Y. *Journal of Geophysical Research (USA)*, 94(A11): 15373-15384 (1 Nov 1989).

Plasma and magnetic field data observed during two ISEE crossings of the plasma sheet boundary layer are studied in conjunction with a linear stability theory analysis. The plasma distribution functions exhibit three distinct potential sources of free energy: ion/ion relative drifts, electron/ion relative drifts corresponding to a nonzero field-aligned current, and large ion temperature anisotropies. These observed distributions are used as source functions in a linear Vlasov theory of electromagnetic instabilities at propagation parallel or antiparallel to the average magnetic field. The theory shows that the field-aligned current gives rise to the low frequency kink-like instability, and anisotropies of the flowing ion components give rise to two distinct branches of the ion cyclotron anisotropy instability with spacecraft frame frequencies both below and above the proton cyclotron frequency Ω_p. Analysis of the magnetic field data demonstrates that the appearance of two fast, counterstreaming, anisotropic ion components corresponds to a significant increase in the magnetic fluctuation energy density both below and above Ω_p, in full agreement with the theoretical predictions. © American Geophysical Union 1989

Measurements of the dissociative Recombination and Excitation of HeH(+), the dissociative excitation of H3(+), the branching ratio for the decay channels for H(+)(3) (v= O) recombination and the cross section for the recombination of H2(+) (v = O) have been performed and are described here. A discussion of the relevance of these measurements to the recombination of H3(+) (v = O) is given. Canada.

29344 (AD-A–216470/5/XAB) **Surface production of ions. Final scientific report, 1 August 1986-30 September 1989.** Seidl, M. Stevens Inst. of Tech., Hoboken, NJ (USA). Dept. of Physics and Engineering Physics. 9 Oct 1989. 145p. Available from NTIS, PC A07/MF A01.

It has been shown that negative hydrogen ions can be produced with high efficiency by backscattering low energy (order of 1 eV) hydrogen atoms or ions from low work-function (less than 1.5 eV) surfaces. This has been demonstrated experimentally by backscattering the Maxwellian tail of thermally produced hydrogen atoms from a variety of low work function surfaces. The general nature of the electron transfer process has been described by a simple theoretical model. Low incident energy guarantees low energy spread of the negative hydrogen ions. It also makes it possible to consider a variety of adsorbates for reducing the work function of the converter surface. The work function of cesium-oxygen films on silicon can be as low as 0.9 eV but these films are too delicate for use on converter surfaces. Thick cesium oxide films with a work function ranging from 1.2 to 1.4 eV have been successfully used on converter surfaces. Surface production of cesium ions from solid electrolyte sources has been investigated. Three types of cesium ion guns were developed and used in the experiments.

29345 (AD-A–216599/1/XAB) **Determining the effects of microwave power and C-field setting on the frequency of a cesium atomic frequency standard. Technical report.** Karuza, S.K.; Johnson, W.A.; Voit, F.J. Aerospace Corp., El Segundo, CA (USA). Electronics Research Lab. 31 Dec 1989. 27p. (TR–0089(4470-03)-1). Available from NTIS, PC A03/MF A01.

In experiments at the United States National Institute of Standards and Technology, Andrea De Marchi showed that there exist optimum values of the C-field setting in a commercial dual-beam cesium frequency standard that make the output frequency insensitive to variations in microwave power. Moreover, and most important, De Marchi demonstrated that the long-term stability of the clock is improved if the C-field is set at one of these optimum settings. To see if these results can be obtained with a clock having a different modulation scheme, the authors, using a completely automated measuring system, performed a similar study on another manufacturer's commercial cesium standard; this standard employed single-beam tube optics and a modulation scheme different from that used by the clocks studied by De Marchi. Our results, similar to those of De Marchi, show that optimum C-field settings exist for the standard we investigated.

29346 (CONF-900289–4) **Negative ion formation processes: A general review.** Alton, G.D. Oak Ridge National Lab., TN (USA). [1990]. 36p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From International workshop on the polarized ion sources and polarized gas jets; Tsukuba-Shi (Japan); 12-17 Feb 1990. Order Number DE90009809. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The principal negative ion formation processes will be briefly reviewed. Primary emphasis will be placed on the more efficient and universal processes of charge transfer and secondary ion formation through non-thermodynamic surface ionization. 86 refs., 20 figs.

29347 (CONF-900466–15) **Interatomic forces and bonding mechanisms in MgO clusters.** Wright, N.F.; Painter, G.S. Oak Ridge National Lab., TN (USA). [1990]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Spring meeting of the Materials Research Society; San Francisco, CA (USA); 16-21 Apr 1990. Order Number DE90010148. Available from NTIS, PC A02/MF A01; OSTI; INIS.

We report results from a first-principles local spin density quantum mechanical study of the energetics and elastic properties of a series of magnesium-oxygen clusters of various morphologies. The role of quantum effects, e.g. covalency, in the bonding character of diatomic MgO is determined by comparison of classical and quantum restoring force curves. The dependence of binding properties on geometry and metal to oxygen ratio is determined by comparison of binding energy curves for a series of clusters. Results show that while gross features of the binding curves may be represented by simple interatomic potentials, details require the many body corrections of a full quantum treatment. 6 refs., 5 figs.

Matematicko-Fyzikalna Fakulta). Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

The term positive streamer covers the filamentary cathode-directed wave of ionization occurring in many electric discharges. Its propagation through the gas is highly influenced by space-charge field enhancements. Both experimental and theoretical studies of the phenomenon are briefly surveyed and the associated difficulties discussed. The aim of the paper is to point out that the use of a negative point/plane electrode geometry simplifies the problem and makes it possible to study the early stages of streamer development as well as the streamer-cathode contact. (J.U.).

29349 (LYCEN–89-06) **Delta excitation in nuclei: the lesson of charge exchange reactions.** Delorme, J. (Lyon-1 Univ., 69 - Villeurbanne (FR). Inst. de Physique Nucleaire); Guichon, P.A.M. Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire. 1989. 25p. (CONF-8903172–: 10. two-yearly meeting on nuclear physics, Aussois (France), 6-10 Mar 1989). Order Number DE90770342. Available from NTIS (US Sales Only), PC A03/MF A01.

We present an attempt of theoretical interpretation of charge exchange reactions on nuclei in the region of the delta resonance. Special care is taken to insure consistency with the constraints from pion and photon excitation channels. Good agreement with measured spectra can be obtained for all types of targets and incident ions except for polarized deuterons data which appear hardly reconcilable with the others within our interpretation. Despite the peripheral character of these reactions, a sizeable part of the observed downward shift of the resonance is possibly ascribable to a yet undetected collective mode of the nucleus at high excitation, the pionic branch. Our limited commitment is due to uncomplete knowledge of the NN $\rightarrow$ N Δ interaction and the transition form factors of the probing ions which has been palliated by some phenomenology.

29350 (N–90-16482) **General contraction of Gaussian basis sets. Part 2: Atomic natural orbitals and the calculation of atomic and molecular properties.** Almloef, J.; Taylor, P.R. Minnesota Univ., Minneapolis, MN (USA). 1989. 38p. (NASA-CR–186201;NAS–1.26:186201). Available from NTIS, PC A03/MF A01.

A recently proposed scheme for using natural orbitals from atomic configuration interaction (CI) wave functions as a basis set for linear combination of atomic orbitals (LCAO) calculations is extended for the calculation of molecular properties. For one-electron properties like multipole moments, which are determined largely by the outermost regions of the molecular wave function, it is necessary to increase the flexibility of the basis in these regions. This is most easily done by uncontracting the outmost Gaussian primitives, and/or by adding diffuse primitives. A similar approach can be employed for the calculation of polarizabilities. Properties which are not dominated by the long-range part of the wave function, such as spectroscopic constants or electric field gradients at the nucleus, can generally be treated satisfactorily with the original atomic natural orbital (ANO) sets.

29351 (N–90-16483) **Theoretical investigations of the structures and binding energies of Be(sub n) and Mg(sub n) (n = 3-5) clusters.** Lee, T.J.; Rendell, A.P.; Taylor, P.R. National Aeronautics and Space Administration, Moffett Field, CA (USA). Ames Research Center. 1989. 23p. (NASA-TM–101931;NAS–1.15:101931). Available from NTIS, PC A03/MF A01.

Researchers determined the equilibrium geometries and binding energies of Be and Mg trimers, tetramers and pentamers using single and double excitation coupled cluster (CCSD) and complete active space self-consistent-field (CASSCF) multireference configuration interaction (MRCI) wave functions in conjunction with extended atomic basis sets. Best estimates of the cluster binding energies are 24, 83 and 110 kcal/mole for Be3, Be4 and Be5; and 9, 31 and 41 kcal/mole for Mg3, Mg4 and Mg5, respectively. A comparison of the MRCI and CCSD results shows that even the best single-reference approach (limited to single and double excitations) is not capable of quantitative accuracy in determining the binding energies of Be and Mg clusters.

29352 (NAC-AR–86-01, pp. 205-207) **Atomic physics: Beam-foil spectroscopy.** National Accelerator Centre, Faure (South Africa). 1986. In *Annual report June 1986.* Order Number DE90624865. Available from NTIS (US Sales Only), PC A13/MF A01; OSTI; INIS.

Beam-foil spectroscopy is a well-established technique for exciting outer-shell transitions which are generally not observable by other spectroscopic techniques. Energetic heavy-ion beams are accelerated by the Van de Graaff accelerator. Outer-shell excitations are induced by passing the beam through a thin carbon foil. The de-excitation radiation in the visible to ultraviolet region is observed in an optical spectrometer. The projects described in this section have investigated atomic spectra for ionised oxygen atoms. 2 tabs., 12 refs.

29355 (SAND--90-0202) **Parametric dependences of the 2.63 and 2.65 μm laser lines of atomic xenon.** Brannon, P.J.; Patterson, E.L.; Samlin, G.E. Sandia National Labs., Albuquerque, NM (USA). Apr 1990. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC04-76DP00789. Order Number DE90008203. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Preliminary results for the parametric dependences of the 2.63 and 2.65 μm lines of a high-pressure xenon laser are given. The power deposition is varied from 200 to 800 W/cm^3 for gas mixtures of Ar(830 Torr)/Xe(4 Torr), Ar(750 Torr)/Xe(83 Torr) and Ar(621 Torr)/He(210 Torr)/Xe(4 Torr). The 2.65 μm line dominates the 2.63 μm line for all gas mixtures and the ratio of the 2.63 μm line intensity to that for the 2.65 μm line is suppressed by the higher concentration of xenon. 13 refs., 4 figs.

29356 (UCRL--21296) **Improved crystal bending techniques applied to the LLNL dual-arm Johann mounting x-ray spectrometer: Final report.** Silver, J.D. (Oxford Univ. (UK). Clarendon Lab.); Chantler, C.T. Lawrence Livermore National Lab., CA (USA); Oxford Univ. (UK). Clarendon Lab. [1990]. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90009528. Available from NTIS, PC A03/MF A01 - OSTI.

Earlier investigations using the LLNL Spectrometer have revealed several limitations to the resolution of observed spectral lines. The first is the broadening due to the finite target source, together with secondary effects due to the bowing of the target. Other limitations relate to the target and spectrometer geometry, and in particular to the small (2R = 30cm) Rowland Circle radius. At small radii the production of a 'perfect' curvature becomes increasingly difficult as distortions of the mosaic spread of crystallite angles are introduced by the stress. This is particularly true of lattice planes with three non-zero Miller indices (e.g. Si111 compared to Si220) and of stiff or thick crystals (e.g. silicon and quartz, which will shatter if >0.2mm crystals are bent to this radius), but small broadening and asymmetrical shifts are also introduced for other crystals. Conversely, soft crystals (such as thin PET) will bend readily to the radius but distort and relax in mountings with fixed bending forces. This report addresses a set of improvements to the bending techniques for both soft and stiff crystals. The first and most important development is the use of parallel, vertical posts and (symmetrical) bending points driven by micrometers instead of the earlier formed (i.e. pressed) crystals. The primary advantage is that the curvature from a small number of stress points is calculable, reproducible and does not introduce random stresses and distortions over the surface. The major methods used include the 2-point, 2-bar mount and the 4-point, 4-bar method. Various 4-point, 2-bar methods were also used. 14 figs.

29357 (UCRL-CR--103296) **High resolution stimulated Raman-Brillouin spectroscopy in gases and solids.** Bischel, W.K. (SRI International, Menlo Park, CA (USA). Molecular Physics Lab.); Dyer, M.J.; Faris, G.W.; Hickman, A.P.; Jusinski, L.E. Lawrence Livermore National Lab., CA (USA); SRI International, Menlo Park, CA (USA). Molecular Physics Lab. Dec 1989. 4p. Sponsored by U.S. Department of Defense; U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90009535. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

High resolution, quasi-cw, stimulated Raman-gain spectroscopy has become a standard technique for the study of molecular energy levels. In this paper we apply this technique to the study of two diverse problems: a determination of the ac Stark effect for the vibrational levels of H_2, and a demonstration of the first high resolution stimulated Brillouin gain spectra in glasses and crystals. 7 refs., 3 figs.

29358 (UCRL-CR--103380) **Correlated electron processes in ion-atom collisions: Final report, September 8, 1988--August 31, 1989.** McColm, D.W. (California Univ., Davis, CA (USA). Dept. of Physics). Lawrence Livermore National Lab., CA (USA); California Univ., Davis, CA (USA). Dept. of Physics. 1 Feb 1990. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90009477. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This final report covers the work carried out under the LLNL Contract P.O. Number B055762, Subcontractor Regents University of California at Davis. The research carried out under this contract investigated electron processes occurring in collisions between heavy ions and atoms. The doubly-differential secondary electron yield following the impact of 3.5 to 8 MeV/uU^{q+}(q = 38,68) ion impact on thin carbon foil targets has been investigated experimentally. The absolute electron emission yields were determined for ejection angles varied between 22.5° and 157° and electron energies ranging from 10 eV to 8 keV. The electron spectra are compared to previous investigations and new experimental data using lighter ion impact at MeV projectile energies. 14 refs., 5 figs.

29359 (UCRL-ID--103424) **The 1989 Livermore Evaluated Photon Data Library (EPDL).** Cullen, D.E.; Perkins, S.T.; Rathkopf, J.A. Lawrence Livermore National Lab., CA (USA). Mar 1990. 65p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008190. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This paper describes the contents of the 1989 Livermore Evaluated Photon Data Library (EPDL) as well as the sources of data, the evaluation methods and how to interpret and use the data. This library contains data for the elements H through Fm, Z = 1 -- 100, over the energy range 10 eV to 100 GeV. For each element cross sections, form factors, coherent anomalous scattering factors and the average energy of all secondary particles are given. 27 refs., 28 figs., 2 tabs.

29360 A new model for the simulation of interfaces at high temperature. Lutsko, J. F. (Materials Science Div., Argonne National Lab., Argonne, IL (US)); Ngayen, T.; Phillpot, S.R.; Wolf, D.; Yip, S. pp. 609 of Interfacial structure, properties and design. Yoo, M.H.; Clark, W.A.T.; Briant, C.L. Materials Research Society, Pittsburgh, PA (USA) (1988). DOE Contract W-31-109-ENG-38. (CONF-8804112--: Interfacial structure, properties and designs in solids, Reno, NV (USA), 5-9 Apr 1988).

A new method for the molecular dynamics simulation of bulk planar interfaces at high temperatures is presented. The method uses the basic Parrinallo-Rahman (constant stress) scheme modified, however, for the application to inhomogeneous systems. Since our computational cell contains only one interface with 2-d periodic boundary conditions we are able to study isolated interfaces all the way up to melting. The interaction between boundaries which may lead to their annihilation at higher temperatures, which is a problem when 3-d periodic boundaries are applied, is thus avoided. As an application, the method is used to study the stability of a grain boundary at high temperatures. Observations on a possible connection between grain boundary migration and premelting are discussed.

29361 NEXAFS studies of unsaturated carboxylic acids and alcohols adborsed on the Si(lll)(7 x 7) surface. Outka, D.A. (Stanford Univ. Stanford, CA (USA)); Stohr, J.; Madix, R.J.; Rotermund, H.H.; Hermsmeier, B.; Solomon, J. pp. 811 of Interfaces, superlattices, and thin films 65491. Dow, J.D.; Schuller, I.K.

Materials Research Society, Pittsburgh, PA (USA) (1987). (CONF-8612131–: Materials Research Society symposium on interfaces, superlattices and thin films, Boston, MA (USA), 1-6 Dec 1986).

The authors present the adsorption of formic (HCOOH), acrylic (CH_2 = CHO_2H), propiolic acid (HC ≡ CCO_2H), and the corresponding alcohols on the Si(III) (7 × 7) surface investigated by NEXAFS. In each case, well-defined dipole transactions were observed above the C and O K-edges and used to probe the orientation and chemistry of theses molecules on this silicon surface. Results illustrate the capabilities of NEXAFS to investigate molecular orientations on surface and the electronic structure of polyatomic adsorbates.

29362 Non-Abelian geometric phase and long-range atomic forces. Zygelman, B. (Institute for Theoretical Physics, University of California at Santa Barbara, Santa Barbara, California 93106 (US)). *Physical Review Letters (USA)*, 64(3): 256-259 (15 Jan 1990).

Using fully quantal methods, we investigate various manifestations of the geometric phase in bound and free diatom systems. Adiabaticity and degeneracy are not invoked in the discussion.

29363 Photoelectron spectroscopy and electronic structure of heavy group IV–VI diatomics. Wang, L. (Department of Chemistry, University of California—Materials and Chemical Sciences Division, Lawrence Berkeley Laboratory, 1 Cyclotron Road, Berkeley, California 94720 (USA)); Niu, B.; Lee, Y.T.; Shirley, D.A.; Balasubramanian, K. *Journal of Chemical Physics (USA)*, 92(2): 899-908 (15 Jan 1990). DOE Contract AC03-76SF00098.

Vibrationally resolved HeI (584 A) photoelectron spectra of the heavy group IV–VI diatomics SnSe, SnTe, PbSe, and PbTe were obtained with a new high temperature molecular beam source. Ionization potentials and spectroscopic constants are reported for all the ionic states observed. Relativistic complete active space multiconfiguration self-consistent field (MCSCF) followed by multireference singles+doubles relativistic configuration interaction (CI) calculations which included up to 200 000 configurations were made on both the neutral diatomics and their positive ions. Ionization potentials and spectroscopic constants were calculated and were in good agreement with the experimentally measured values. Relativistic CI potential energy curves were calculated for all the neutral ground states and the ionic states involved. Relativistic effects were shown to play an important role in these heavy diatomics. The $^2\Sigma^+_{1/2}$ and $^2\Pi_{1/2}$ states for all four molecular ions showed avoided curve crossings, which resulted in pronounced shoulders in the Ω=1/2 potential energy curves of $PbTe^+$. Experimentally, autoionization transitions were also observed for the $PbTe^+$ spectrum. The importance of the relativistic effect and chemical bonding in the heavy diatomics are discussed.

29364 Reduced dimensionality diatom–diatom reactive scattering: Application to a model $H_2+A_2 \rightarrow H+HA_2$ reaction. Sun, Q. (Department of Chemistry, Emory University, Atlanta, Georgia 30322 (US)); Bowman, J.M. *Journal of Chemical Physics (USA)*, 92(2): 1021-1029 (15 Jan 1990). DOE Contract FG05-86ER13568.

We apply a recently formulated quantum theory of diatom–diatom reactions [Q. Sun and J. M. Bowman, Int. J. Quant. Chem., Quant. Chem. Symp. **23**, 9 (1989)] to a model collinear $H_2+A_2 \rightarrow H+HA_2$ reaction, where A has the mass of a hydrogen atom. The theory assumes one diatom bond is nonreactive, and the reactive scattering Hamiltonian is written in terms of hyperspherical and cylindrical coordinates. The potential-energy surface used is the PK2 $H+H_2$ surface augmented by a harmonic degree of freedom describing the nonreactive A_2. Details of the formulation and solution of the coupled-channel equations are given, along with convergence tests, and a discussion of the new state-to-state transition probabilities. In particular, the partial quenching of the well-known collinear $H+H_2$ resonances is noted.

29365 The infrared spectrum of trimethylenemethane. Predictions of in-plane vibrational frequencies from correlated wave functions. Blahous, C.P. III (Center for Computational Quantum Chemistry, University of Georgia, Athens, Georgia 30602 (US)); Xie, Y.; Schaefer, H.F. III. *Journal of Chemical Physics (USA)*, 92(2): 1174-1179 (15 Jan 1990). DOE Contract FG09-87ER13811.

The infrared vibrational spectrum of trimethylenemethane (TMM) is predicted with self-consistent field and configuration interaction methods. The $^3A'_2$ electronic ground state of TMM is described in terms of restricted Hartree–Fock theory and in light of experimental evidence. Analytic gradient methods are employed to optimize theoretical geometries for $^3A'_2$ TMM; vibrational frequencies are evaluated via analytic second-derivative techniques (self-consistent-field) and finite differences of analytic gradients (configuration interaction). The resulting IR-spectral predictions are modified to reflect average errors statistically associated with the two theoretical methods.

29366 Bulk properties from finite-cluster calculations. V. Pseudo-Wannier orbitals from molecular orbital calculations on finite clusters. Cioslowski, J. (Department of Chemistry and Supercomputer Computations, Research Institute, Florida State University, Tallahassee, Florida 32306-3006 (US)). *Journal of Chemical Physics (USA)*, 92(2): 1236-1239 (15 Jan 1990). DOE Contract FC05-85ER25000.

A unitary transformation of the canonical Hartree–Fock orbitals which yields pseudo-Wannier orbitals in periodic finite systems is introduced. These orbitals are localized within individual unit cells and therefore can serve as a suitable one-electron basis for calculating the electron correlation energy. They also provide a natural partitioning scheme which allows for studying the finite-size effects on the total energy and the first-order electronic properties. The similarity sum which is maximized by the above transformation can serve as a measure of deviation of the electronic distribution in the system under consideration from that of an infinite periodic system.

29367 Free energy and stability of macromolecules studied by the double scanning simulation procedure. Meirovitch, H. (Supercomputer Computations Research Institute, Florida State University, Tallahassee, Florida 32306-4052 (USA)); Vasquez, M.; Scheraga, H.A. *Journal of Chemical Physics (USA)*, 92(2): 1248-1257 (15 Jan 1990). DOE Contract FC05-85ER25000.

The double scanning method (DSM) is a computer simulation technique suggested recently by Meirovitch [J. Chem. Phys. **89**, 2514 (1988)]. This method is a variant of the usual or "single" scanning method (SSM) of the same author, which was extended by us to polypeptides [Biopolymers **27**, 1189 (1988); this paper is designated here as paper II]. The two methods are step-by-step construction procedures from which the entropy and the free energy can be estimated. The transition probabilities are obtained by scanning the so-called "future" chains, which are continuations of the chain in future steps up to a maximum of *b* steps. With the SSM, the process is carried out by exact enumeration of the future chains; this is time consuming, and therefore *b* is limited to small values. With the DSM, on the other hand, only a relatively small sample of the future chains is generated by applying an additional scanning procedure. This enables one to increase *b* at the expense of approximating the transition probabilities. Increasing of *b*, however, is important in order to treat medium- and long-range interactions more properly. In this paper (as in our paper II), we apply the DSM to a model of decaglycine without solvent, described by the potential energy function ECEPP at 100 and 300 K. Using the SSM with the maximal value, *b*=4, we found in paper II that, at 100 K, the α helix rather than the statistical coil is the most stable state. The present DSM simulation at *T*=100 K (based on *b*=5) is more efficient than the SSM, and a structure with significantly lower energy than that of the α helix is found. It is argued that *b* can be increased further to 7 at this temperature. At 300 K the DSM, like the SSM, shows that the statistical coil is the most stable state of decaglycine. However, the DSM is found to be less efficient than the SSM.

29368 Measurement of atomic indium during metalorganic chemical vapor deposition. Hebner, G.A. (Sandia National Laboratories, P.O. Box 5800, Albuquerque, New Mexico 87185 (US)); Killeen, K.P. *Journal of Applied Physics (USA)*, 67(3): 1598-1600 (1 Feb 1990).

Atomic indium, produced by the pyrolysis of trimethylindium (TMIn) during metalorganic chemical vapor deposition, has been directly observed using resonant fluorescence spectroscopy. The

indium fluorescence signal is linear with TMIn flow rate at a susceptor temperature of 500 °C above a small background threshold level. The threshold for the observation of an indium signal is 325 °C. Addition of trimethylantimony (TMSb) at concentrations less than those required for normal InSb epitaxial growth results in quenching of the indium signal.

29369 Observation of a SO^+_2 threshold photoelectron band in the energy range 14.4–15.5 eV. Norwood, K. (Ames Laboratory, U. S. Department of Energy—Department of Chemistry, Iowa State University, Ames, Iowa 50011 (USA)); Ng, C.Y. *Journal of Chemical Physics (USA)*, 92(2): 1513-1515 (15 Jan 1990). DOE Contract W-7405-ENG-82.

In orderto gain insight into the autoionization mechanisms of sulfur dioxide, the threshold photoelectron spectrum was measured in the wavelength region of 800–860 Angtroms.(AIP)

29370 Quantum state-resolved study of the rovibrational excitation of OCS by hot hydrogen atoms. Zhu, L. (Department of Chemistry and Columbia Radiation Laboratory, Columbia University, New York, New York 10027 (US)); Hershberger, J.F.; Flynn, G.W. *Journal of Chemical Physics (USA)*, 92(3): 1687-1695 (1 Feb 1990). DOE Contract FG02-88ER13937.

The vibrationally inelastic scattering of OCS by hot hydrogen atoms was studied using an excimer laser photolysis/diode laser probe technique. Nascent rotational distributions for the 10^00 (2062 cm^{-1}) and 00^01 (859 cm^{-1}) stretching vibrations are well fit to Boltzmann temperatures of 840±50 and 545±60 K, respectively. The total vibrational excitation probability of the 00^01 state was about 2.3±0.3 times that of the 10^00 state. Measurement of OCS linewidths immediately after hot atom collisions indicate translational recoil temperatures that vary from 360 to 730 K, with a positive dependence on rotational state. The results are interpreted in terms of repulsive, hard shell collisions with the different stretching vibrations arising from trajectories approaching different ends of the OCS molecule.

29371 Photodissociation and continuum resonance Raman cross sections and general Franck–Condon intensities from *S*-matrix Kohn scattering calculations with application to the photoelectron spectrum of $H_2F^- + h\nu \rightarrow H_2 + F$, $HF + H + e^-$. Zhang, J.Z.H. (Department of Chemistry, University of California, Berkeley, CA (US)— Materials and Chemical Sciences Division, Lawrence Berkeley Laboratory, Berkeley, California 94720 (US)); Miller, W.H. *Journal of Chemical Physics (USA)*, 92(3): 1811-1818 (1 Feb 1990). DOE Contract AC03-76SF00098.

It is shown how the *S*-matrix version of the Kohn variational method for quantum scattering can be readily adapted to compute matrix elements involving the scattering wave function and also matrix elements of the scattering Green's function. The former of these quantities is what is involved in computing photodissociation cross sections, photodetachment intensities from a bound negative ion to a neutral scattering state, or the intensity of any Franck–Condon transition from a bound state to a scattering state. The latter quantity (i.e., a matrix element of the scattering Green's function between two bound states) gives the resonance Raman cross section for the case that the intermediate state in the Raman process is a scattering state. Once the basic *S*-matrix Kohn scattering calculation has been performed, it is shown that little additional effort is required to determine these quantities. Application of this methodology is made to determine the electron energy distribution for photodetachment of H_2F^- to $F+H_2$, HF+H. Resonance structure in the $J=0$ reaction probabilities is seen to appear in the electron energy distribution.

29372 Rotational state distributions from vibrational autoionization of H_2 revisited. Pratt, S.T. (Argonne National Laboratory, Argonne, Illinois 60439 (US)); McCormack, E.F.; Dehmer, J.L.; Dehmer, P.M. *Journal of Chemical Physics (USA)*, 92(3): 1831-1838 (1 Feb 1990). DOE Contract W-31-109-ENG-38.

Photoelectron spectra of vibrationally autoionized $(X\ ^2\Sigma^+_g)np$, $v=1,2$ Rydberg states of H_2 were obtained by using an optical–optical double-resonance technique. The spectra were obtained by using a hemispherical electrostatic electron energy analyzer that had sufficient resolution to determine the rotational state distributions of the H^+_2 ions. The ionization process occurred in a magnetic and electric field-free region. All of the results are consistent with the assumptions that the photoelectrons are ejected as *p* waves and that spin effects are negligible. This is in sharp contrast to our earlier results obtained by using a magnetic bottle electron spectrometer, in which the ionization process occurred in a 0.5–1.0 T magnetic field [J. L. Dehmer *et al.*, J. Chem. Phys. **90**, 6243 (1989)]. It is concluded that the magnetic field can significantly modify the rotational distributions observed for vibrational autoionization. The implications of this conclusion are discussed, with particular attention to other experiments performed with the magnetic bottle spectrometer.

29373 Raman intensities and interference effects for thin films adsorbed on metals. Ager, J.W. III (Center for Advanced Materials, Materials and Chemical Sciences Division, Lawrence Berkeley Laboratory, Berkeley, California 94720 (US)); Veirs, D.K.; Rosenblatt, G.M. *Journal of Chemical Physics (USA)*, 92(3): 2067-2076 (1 Feb 1990). DOE Contract AC03-76SF00098.

Large oscillations in the vibrational Raman intensity have been observed for thin films adsorbed on a metal substrate as a function of film thickness. The systems studied, N_2 and O_2 physisorbed on Ag(111) at 14±1 K, have previously been shown to be unenhanced, i.e., the observations are not caused by the surface enhanced Raman (SERS) effect. The observed oscillations are due to multiple beam interference caused by reflections at the film boundaries of the incident laser light, and, to a lesser extent, the Raman scattered light. We extend the two-dimensional theoretical development of Moscovits and co-workers for Raman scattering in thin films to include more general three-dimensional experimental geometries. We derive expressions for the total intensity as a function of film thickness, incident laser polarization and angle, and scattered light polarization and angle. The resultant expressions are applicable to Raman scattering from any dielectric thin film adsorbed on a substrate with known optical parameters. Although complicated, the general expressions have been numerically evaluated for our experimental conditions using a commercial mathematical package on a personal computer. The calculated Raman intensities are in excellent agreement with the experimental results. The observed period of the intensity oscillation relates the film thickness to the exposure allowing the sticking probabilities to be determined. The sticking probabilities of N_2 on N_2 and O_2 on O_2 at 14±1 K are 0.84±0.2 and 0.82±0.2, respectively.

29374 Reply to the Comment on: "Lifetime of the $A\ ^2\Sigma^+$, $v'=0$ state of HS". Loge, G.W. (Chemical and Laser Sciences Division, Los Alamos National Laboratory, M.S.J567, P. O. Box 1663, Los Alamos, New Mexico 87545 (USA)); Tiee, J.J. *Journal of Chemical Physics (USA)*, 92(3): 2122 (1 Feb 1990).

The results of measurements of the lifetime of the excited states of SH, using Hanle effect and by measuring linewidths in LIF–molecular beam is explained.(AIP)

29375 (DOE/ER/25061–6) **Analytical and numerical studies in flow development: Progress report, 1 July 1989 to present.** Criminale, W.O.; Adams, L.M. Washington Univ., Seattle, WA (USA). Dept. of Applied Mathematics. Mar 1990. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-88ER25061. Order Number DE90010424. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Analytical bases have been established for a wide variety of shear flows under general initial conditions. In addition, provisions have been made for study of both spatial and temporal development of disturbances. This combination is the essential framework for eventual direct numerical simulation of the three major prototypes of flow, namely bounded (channel) flow; semi-infinite (boundary layer) flow; and unbounded (mixing layer) flows. Besides the asset of having closed form solutions in all spatial coordinates and time, the important transient (initial) state of the motion can be determined explicitly. Of particular note is the fact that nonlinearity can be triggered by algebraic growth of disturbances — and therefore an alternate route for the breakdown to turbulence is possible.

Such events have been termed "bypass" because they can occur in a shorter time (or spatial) scale than that of the more common asymptotic exponential growth due to the instability of the flow. It is for these reasons that the eventual kinking of the solutions to the numerical simulation is awaited with optimism.

29376 (SAND–89-1927C) **Partial acoustic filtering applied to the equations of compressible flow.** Torczynski, J.R. Sandia National Labs., Albuquerque, NM (USA). [1990]. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-900651–1: International symposium on nonsteady fluid dynamics, Toronto (Canada), 4-7 Jun 1990). Order Number DE90000673. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Gas contained in a rectangular enclosure of large length and small width is subjected to large, transient, spatially nonuniform, volumetric heating. The heating timescale is much longer than the time required for an acoustic wave to traverse the width but can be comparable to the time required for an acoustic wave to traverse the length. Approximate equations are derived from the two-dimensional equations of mass, momentum, and energy conservation for a perfect gas without viscosity or thermal conductivity. This is accomplished by applying partial acoustic filtering to the equations of motion: pressure waves traversing the width are removed while pressure waves traversing the length are retained. The pressure is partitioned into the average pressure across the width, which is O(1), and the small remaining perturbation that is the difference between the pressure and its average. The resulting equations are hyperbolic for the average pressure term but are elliptic for the perturbation pressure term. If an explicit numerical method is used to solve the approximate system, the maximum allowable time step is potentially much larger than the time step for the original system, which is dominated by resolution of pressure waves propagating across the width. Application of partial acoustic filtering to three-dimensional geometries is discussed. 5 refs.

29377 (UCRL-ID–103198) **Index and consistency analysis for DAE [differential-algebraic equation] systems for Stefan-Maxwell diffusion-reaction problems.** Hindmarsh, A.C. Lawrence Livermore National Lab., CA (USA). 6 Mar 1990. 25p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008188. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The paper by Hindmarsh and Johnson discusses the formulation and solution of certain reaction-diffusion systems involving Stefan-Maxwell diffusion. This report is intended to provide supportive analytical results concerning the systems of differential-algebraic equations (DAEs) treated in that paper. The systems considered have only one reactant fluid, one product fluid, and one reactant solid; this restricted problem was chosen because the various solvability issues can be settled quite thoroughly. Of particular interest is the index of the DAE systems, the evaluation of consistent initial conditions, and the conservation of the sum of fluid mole fractions. 3 refs.

Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900684–1: 5. international colloquium on free boundary problems: theory and applications, Montreal (Canada), 13-22 Jun 1990). Order Number DE90009186. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This article summarizes some recent work on the creeping viscous incompressible plane flow in a region, bounded by a simple smooth closed curve and driven solely by surface tension. Such problems are self-contained in that the applied tractions are intrinsic in the geometry. The objective is to determine exactly the time evolution of the shape of the region. The problems are fundamentally nonlinear due to the large changes in shape, and it is emphasized that no mathematical approximations are made. For finite regions, the shape in the complex z-plane is described in terms of a time-dependent conformal mapping function $\Omega(\zeta,t)$ on the fixed region $||\zeta|| \leq 1$ of the complex. In practice, it has been necessary to conjecture an explicit parametric form $\Omega[\zeta;a_1(t), a_2(t),\cdots]$ whose validity must be verified using the shape-evolution equation. Suitable parameterizations are not always obvious. When the conjectured form hold and the equations can be solved, the equation of the shape with time is obtained in simple, exact and closed form except for the value of the time, which requires a mere quadrature. Internal velocity and stress field can be obtained. 6 refs., 2 figs.

Lawrence Livermore National Lab., CA (USA). Feb 1990. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9006156–2: 8. international conference on computational methods in water resources, Venice (Italy), 11-15 Jun 1990). Order Number DE90009948. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Massively parallel computers, with numerous processor/memory elements connected by high-speed communication channels, will be the standard computing environment in the future. Efficient use of these resources requires algorithms that are well-matched to these architectures. The particle method for solute transport, utilizing a random walk technique for the dispersion term, is a naturally parallel algorithm for solving the advection-dispersion equation. Results of implementation of the random walk particle-grid method in three spatial dimensions on the Intel iPSC/2 are presented. Speedups are measured and high efficiency is obtained for the kernels tested. Future directions are discussed briefly. 8 refs., 3 tabs.

29380 **High Marangoni number convection in a square cavity: Part II.** Carpenter, B.M. (Department of Chemical Engineering, Stanford University, Stanford, California 94305 (US)); Homsy, G.M. *Physics of Fluids A (USA)*, 2(2): 137-149 (Feb 1990).

Steady thermocapillary flow is examined in a square two-dimensional cavity with a single free surface and differentially heated side walls. The numerical solutions are obtained with a finite difference method applied to a streamfunction-temperature formulation. This work investigates the Prandtl number dependence, structure, and stability of high Marangoni number flow. It is found that the character of thermocapillary flow is highly sensitive to the value of the Prandtl number over a range of Marangoni numbers exceeding 1×10^5 for $1\leq Pr\leq 50$, the magnitude of the flow showing nonmonotonic dependence on the Marangoni number for $Pr\leq\sim10$. A complete structural analogy is observed between flow in a cavity driven by a moving lid and thermocapillary flow in the boundary layer limit, and it is found that all the solutions, spanning a wide range of Marangoni and Prandtl numbers, are linearly stable to a restricted class of disturbances.

29381 **Collapsing solutions to the 3-D Euler equations.** Pumir, A. (Ecole Normale Superieure, Department de Physique, 24 rue Lhomond, 75231 Paris Cedex 05, France (FR)— C. E. N. Saclay, 91191 Gif-s/Yvette, France). *Physics of Fluids A (USA)*, 2(2): 220-241 (Feb 1990). DOE Contract AC02-83ER13044.

A three-dimensional adaptive mesh code is used to search for singularities in the incompressible Euler equations. For the initial conditions examined, the maximum vorticity eventually grows only exponentially. The small scales are quasi-two-dimensional and the vorticity has a pronounced tendency to develop sharp jumps in magnitude. The vorticity is very nearly parallel to the eigenvector of the rate-of-strain matrix whose eigenvalue is the smallest in magnitude. This eigenvalue is positive and much smaller than the others.

29382 **A diffusion model for velocity gradients in turbulence.** Girimaji, S.S. (Sibley School of Mechanical and Aerospace Engineering—Cornell University, Ithaca, New York 14853 (USA)); Pope, S.B. *Physics of Fluids A (USA)*, 2(2): 242-256 (Feb 1990).

In this paper a stochastic model for velocity gradients following fluid particles in incompressible, homogeneous, and isotropic turbulence is presented and demonstrated. The model is constructed so that the velocity gradients satisfy the incompressibility and isotropy requirements exactly. It is further constrained to yield the first few moments of the velocity gradient distribution similar to those computed from full turbulence simulations (FTS) data. The performance of the model is then compared with other computations from FTS data. The model gives good agreement of one-time statistics. While the two-time statistics of strain rate are well replicated, the two-time vorticity statistics are not as good, reflecting perhaps a

certain lack of embodiment of physics in the model. The performance of the model when used to compute material element deformation is qualitatively good, with the material line-element growth rate being correct to within 5% and that of surface element correct to within 20% for the lowest Reynolds number considered. The performance of the model is uniformly good for all the Reynolds numbers considered. So it is conjectured that the model can be used even in inhomogeneous, high-Reynolds-number flows, for the study of evolution of surfaces, a problem that is of interest particularly to combustion researchers.

29383 **A second-order projection method for the incompressible Navier–Stokes equations.** Bell, J.B. (Lawrence Livermore National Laboratory, Livermore, California 94550 (USA)); Colella, P.; Glaz, H.M. *Journal of Computational Physics (USA)*, 85(2): 257-283 (Dec 1989). DOE Contract W-7405-ENG-48.

In this paper we describe a second-order projection method for the time-dependent, incompressible Navier–Stokes equations. As in the original projection method developed by Chorin, we first solve diffusion-convection equations to predict intermediate velocities which are then projected onto the space of divergence-free vector fields. By introducing more coupling between the diffusion–convection step and the projection step we obtain a temporal discretization that is second-order accurate. Our treatment of the diffusion-convection step uses a specialized higher order Godunov method for differencing the nonlinear convective terms that provides a robust treatment of these terms at high Reynolds number. The Godunov procedure is second-order accurate for smooth flow and remains stable for discontinuous initial data, even in the zero-viscosity limit. We approximate the projection directly using a Galerkin procedure that uses a local basis for discretely divergence-free vector fields. Numerical results are presented validating the convegence properties of the method. We also apply the method to doubly periodic shear-layers to assess the performance of the method on more difficult applications. © 1989 Academic Press, Inc.

29384 **Chaotic characteristics of a complex gas-solids flow.** Daw, C.S. (Oak Ridge National Laboratory, Post Office Box 2009, Oak Ridge, Tennessee 37831-8087 (US)); Lawkins, W.F.; Downing, D.J.; Clapp, N.E. Jr. *Physical Review, A (General Physics) (USA)*, 41(2): 1179-1181 (15 Jan 1990).

We interpret experimental pressure-drop measurements from a complex gas-solids flow system in terms of recently developed methods for chaotic time-series analysis. The results strongly support the conjecture that the flow can be described by a low-dimensional strange attractor that changes as a key turbulence parameter is varied. The analysis methods also appear to permit clear separation of the chaotic and noise components in the signal.

29385 (SLAC–343, pp. 7-30) **The τ-charm factory storage ring initial design and parameters.** Jowett, J. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The initial design and parameters of the tau-charm factory storage ring is presented. The history of the machine design from January 1987 to May 1989 is included. Items in this report include: luminosity, micro-beta insertion and separation scheme, triplet focusing, injection and geometry, optics, rf system, parameter list, and variation of parameters with energy. An efficient, high-performance injection system is indicated as vital.

29386 (SLAC–343, pp. 31-41) **Crab-crossing in a tau-charm facility.** Voss, G.A.; Paterson, J.M.; Kheifets, S.A. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Crab-Crossing in a tau-charm facility is reviewed. In a crab-crossing beam geometry (beam-crossing half-angle alpha), bunches are rotated by the angle alpha around their centers in deflecting RF cavities such that at the IP the two long axes of the bunches (along which phase oscillations take place) are colinear. This changes effectively the crossing beam geometry into a head-on collision geometry with a simultaneous transverse motion in the laboratory reference system. Horizontal versus vertical beam crossing is discussed. The design of a crab-crossing arrangement for a tau-charm facility is included. Tolerances, beam loading, and average current limitations are presented.

29387 (SLAC–343, pp. 90-112) **Status of the Tau one prong problem.** Hayes, K.G. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The present status of the tau one prong problem is reviewed. Emphasis is placed on recent published branching fraction measurements, the status and implications of tau lifetime measurements, and measurements which constrain the sum of branching fractions to be unity.

29388 (SLAC–343, pp. 113-126) **Rare tau decays.** Barish, B.C. (California Institute of Technology, Pasadena (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The possibilities and challenges for studying rare decays of the τ with the large data samples from a tau-charm factory are discussed. These studies involve expected decay of the τ like multihadronic channels, suppressed decays like 2nd class currents or Cabibbo suppression, and possible unexpected decays.

29389 (SLAC–343, pp. 127-151) **An overview of charmed meson physics accessible to a high luminosity collider operated near charm pair thresholds.** Schindler, R.H. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The second generation up-type quark, charm, may be the only quark for which Cabibbo allowed, singly Cabibbo forbidden, doubly Cabibbo forbidden, second order weak and perhaps even CP violating transitions will be measurable. The charm physics at the Tau-Charm Factory is thus organized along those lines, namely; weak hadronic decays (allowed thru doubly forbidden), pure and semi-leptonic decays (allowed and forbidden), rare decays, second order weak decays, and CP violating decays. The pure leptonic decays allow them to probe the quark overlap in the charm meson in a theoretically unambiguous fashion. These measurements would provide important benchmarks for Lattice QCD. The semileptonic decays provide information on the dynamics of heavy quark decay, one vertex being wholly uninfluenced by QCD. The full range of allowed, forbidden and doubly forbidden hadronic decays test their detailed understanding of the hadronic weak current and the contributions of perturbative and non-perturbative QCD to a heavy quark system. They clearly represent the most difficult processes to untangle, but benefit from the detailed studies of the leptonic and semileptonic processes accessible to the Tau-Charm Factory. The rare decays provide a test of the Standard Model (SM), and are

sensitive to the exchange of massive new (10-100s TeV) particles. Since couplings to new particles may be flavor dependent, these decays provide complementary information to that obtained in rare Kaon decay experiments. $D^0\bar{D}^0$ mixing is one of the few second order weak processes still accessible to experiment. It is potentially very interesting since its rate may be heavily influenced by the presence of intermediate states in the second order weak decay. The origin of CP violation remains a mystery to this day.

29390 (SLAC–343, pp. 169-195) **$D^0\bar{D}^0$ mixing and CP violation in D decays - Can there be high impact physics in charm decays?** Bigi, I.I. (Univ. of Notre Dame, IN (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The phenomenology of D^0-$\bar{D}^0$ mixing and of CP violation in D decays is described. Semiquantitative predictions based on the Standard Model are given on the possible strength of these phenomena. It is pointed out that New Physics beyond the Standard Model would probably enhance these phenomena in quite a significant way. To justify a New Initiative one has to be able to probe D^0-$\bar{D}^0$ mixing down to $r_D = 10^{-4}$ (or better) and CP asymmetries down to 1% (or better). It is of obvious benefit for such searches if one is able to track the proper time evolution of these decays by locating the decay vertices. Yet this can hardly be achieved if one uses e^+e^- annihilation operating in the charm threshold region. It is discussed in some detail how the same kind of dynamical information can be obtained even without visible decay vertices, namely by employing $D\bar{D}$ decay correlations in a judicious fashion.

29391 (SLAC–343, pp. 196-206) **Rare decays of D-mesons.** Willey, R.S. (Univ. of Pittsburgh, PA (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

A proposed Tau-charm factory could reach branching ratios (BR) for D-meson decays down the 10^{-7} level (see the rest of these proceedings). In this contribution the author gives the theoretical expectations for some rare decay modes. The modes considered are: (1) Lepton number violating decays e.g. $D^0 \to \mu^+e^-$. (2) Flavor changing neutral current (FCNC) semileptonic and radiative modes, $D \to \ell\bar{\ell}X$, $D \to \nu\bar{\nu}X$, $D \to \gamma X$. The discussion will be in 2 contexts: (i) the standard model (SM; in particular the minimal version with just three generations of fermions and one Higgs doublet.) (ii) anything beyond the minimal standard model (new physics).

29392 (SLAC–343, pp. 207-219) **J/ψ and charmonium physics in a tau charm factory.** Toki, W.H. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

A high luminosity Tau Charm Factory will yield a sample of 10^9 J/ψ and .5 x 10^9 ψ′ produced events per month of running. This represents an enormous increase over previous data samples. In this paper the physics of glueballs, charmonium decays, meson spectroscopy, and rare decays of the J/ψ and ψ′ that are possible with this data are discussed.

29393 (SLAC–343, pp. 231) **High statistics experiments: The LASS experience.** Awaji, N.; Fujii, K.; Hayashii, H.; Iwata, S.; Kajikawa, R.; Matsui, T.; Miyamoto, A.; Ozaki, H.; Pak, C.; Shimomura, T. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

This paper summarizes the main data processing and analysis procedures employed by the LASS collaboration in the course of a Kp experiment involving 138 million triggers at an incident momentum of 11 GeV/c. The role of multivertex kinematic fitting at the coordinate level is described, and the importance of the ~4 π acceptance for both large and small statistics exclusive channels is discussed. The evolution in understanding of the amplitude structure of mesonic states which has resulted from the acquisition and analysis of large data samples is illustrated using the Kπ S-wave and the partial wave decomposition of the low-mass Kππ system. Implications for future studies of sš spectroscopy at the KAON factory, and for amplitude analyses of meson systems produced in J/ψ decay at a Tau-Charm factory are considered.

29394 (SLAC–343, pp. 232-243) **A Tau-Charm factory in the United States.** Coward, D.H. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

As the conclusions of the many presentations made at the Tau-Charm Workshop illustrate, a strong case can be made for the physics program that can be accomplished at a Tau-Charm Facility. This idea is now being taken one step further. A group of physicists and engineers have started a serious effort to design a Tau-Charm Facility for the US. Their first choice would be to place the Facility at SLAC, but, since it would be built with its own injector and positron source, it could be built at any number of other suitable locations in the US. The people who worked hard on the concept (both from the accelerator physics and particle physics points-of-view) and the initial design leading up to the Workshop are given in the first reference.

29395 (SLAC–343, pp. 244-251) **τ-charm factory workshop machine physics summary.** Brown, K.L.; Fieguth, T.; Jowett, J.M. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Designing a τ-charm Factory to meet the requirements of the experimentalists raises a number of challenging problems in accelerator physics. This was reflected in a set of particularly productive sessions in the Accelerator Physics Working Groups. The summary which follows is intended as a guide to help the reader find his way through the more detailed material reproduced in these proceedings. They have tried to list the participants after the headings summarizing the work of the accelerator physics subgroups but it should be borne in mind that the composition of the subgroups varied in time and there was a good deal of overlap among them.

29396 (SLAC–343, pp. 252-288) **Physics summary τ-Charm factory workshop.** Seiden, A. (Univ. of California, Santa Cruz (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The author will try to emphasize examples of the most important and unique physics topics for the τ-charm factory. The author will assume that a year of data-taking corresponds to an integrated luminosity of 10^{40} cm^{-2}. Detailed analysis of the signal rates and backgrounds has been done using a detector approximately similar to the one worked out at the workshop. Effects of resolution and particle decays are usually included in the simulation. More subtle sources of systematics have not yet been fully studied.

29397 (SLAC–343, pp. 289-293) **Triggers at a Tau/Charm factory.** Thaler, J.J. (Univ. of Illinois, Urbana (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Data rates and pattern recognition are considered for a general purpose detector at a tau/charm factory operating at 10^{33} luminosity. The conclusion is that the primary concern must be to control the understanding of efficiencies and systematic errors at the 0.1% level. Data rates are manageable even at the highest luminosity.

Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

During the Workshop the physics goals of the τ-charm Factory (τcF) were studied and their specific detector requirements evaluated. Based on these requirements and the constraints of the machine, the Detector Working Groups explored various approaches and arrived at a basic detector configuration, using existing technologies, that successfully meets the physics requirements. This configuration, which they summarize in this paper, involves a conceptual design with an initial specification of detector components, their locations and dimensions. No attempt was made at the Workshop to go into detailed aspects of the design or to optimize the materials, dimensions, granularities, etc; this next stage of the detector design is taking place over the coming months.

29399 (SLAC–343, pp. 317-329) **Design of a high luminosity collider for the Tau-Charm factory.** Oide, Katsunobu. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Important relations between basic parameters of a high-luminosity collider are discussed. As the result, it is shown that the maximum bunch spacing is limited by the beam current to clear the threshold of the bunch lengthening. In order to solve the short bunch spacing, the crab-crossing scheme is applied to a design of the ring with 2.2 GeV, 2×10^{33} cm^{-2} s^{-1} luminosity.

29400 (SLAC–343, pp. 342-354) **Multibunch instability investigations for a Tau-Charm Factory.** Zisman, M.S. (Lawrence Berkeley Lab., CA (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. DOE Contract AC03-76SF00098. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

In the design of high-luminosity colliders for high-energy physics, it has become clear that multibunch instabilities will be one of the primary effects that limit beam intensity, and hence luminosity. This paper reports on a series of calculations of multibunch growth rates, using the LBL accelerator physics code ZAP, that illustrate the seriousness of the effect for typical design parameters of a Tau-Charm Factory.

29401 (SLAC–343, pp. 355-368) **Calculation of coupled-bunch instabilities in a Tau-Charm Factory.** Thompson, K.A. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

An essential consideration in the design of tau-charm factory storage rings is the control of coupled-bunch instabilities. In this paper, examples of calculations of the growth times of these instabilities are presented. With careful attention to the design of the RF and feedback systems, it should be feasible to control these instabilities and achieve the desired luminosity.

29402 (SLAC–343, pp. 369-377) **Status and limits of DORIS II.** Nesemann, H. (DESY, Hamburg (West Germany)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

DORIS first came into operation in 1973 as a double ring. Later on it was rebuilt as a single ring, and the maximum energy was increased from 3.5 GeV and to 5.6 GeV. The experience with the double ring is briefly described, and that with the single ring in more detail. Emphasis is put on those topics which are important for the design of the future storage ring colliders. DORIS II is also operating as a source for synchrotron radiation. But this aspect is not treated here.

29403 (SLAC–343, pp. 378-386) **A fast injection system with a superconducting accumulator ring for a Tau Charm Factory.** Barletta, W.A. (Univ. of California, Los Angeles (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. DOE Contract W-7405-ENG-48. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The type of high luminosity, storage ring collider being studied by SLAC for a tau-charm factory will require high energy, low emittance sources of positrons and electrons suitable for filling the rings. Ideally, the fill time should be much shorter than the luminosity life-time of the rings. For the purpose of estimating the characteristics of the injection system, the maximum fill time is taken to be O (100) seconds. The characteristics of the asymmetric storage rings have been studied by Jowett (1). In his parameter studies, Jowett has found that the luminosity life time should be O(10^4 sec). Similar studies conducted at SLAC prior to this workshop have resulted in a set of specifications to be met by the designers of the injection system.

29404 (SLAC–343, pp. 387-393) **Effects of charged Higgs in τ decay.** Tsai, Yungsu. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

An experiment to test the effect of charged Higgs exchange in τ decay is proposed. It is pointed out that in the decay $\tau^- \rightarrow \nu_\tau + \pi^- + \pi^0$ the effect due to Higgs exchange can be obtained by observing the angular distribution of the π^- in the rest frame of the $\pi^- + \pi^0$. For each value of invariant mass of the $\pi^- + \pi^0$ system, the π^- must have a unique p-wave angular distribution independent of the strong interaction if it is due to W^- exchange alone. Any s-wave interference with this p-wave angular distribution can be attributed to the scalar exchange.

29405 (SLAC–343, pp. 394-404) **Effects of W_R and charged Higgs in the leptonic decay of τ.** Tsai, Yungsu. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA),

23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Experimental test of the existence of the right-hand W boson and the charged Higgs particle is suggested. The experiment involves measurement of muon polarization from the decay of polarized τ.

29406 (SLAC–343, pp. 405) **A heavy fourth family neutrino and the τ-lifetime discrepancy.** Shin, M. (Univ. of California, Irvine (USA)); Silverman, D. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

If there is a fourth generation, then the τ neutrino ν_τ will be a superposition of the mass eigenstates $\nu_\tau = U_{\tau 1}\nu_1 + U_{\tau 2}\nu_2 + U_{\tau 3}\nu_3 + U_{\tau 4}\nu_4$. It is possible that the fourth family neutrino is heavier than the τ itself, so that the τ cannot decay to this component of its wave function, resulting in a decrease in the decay probability or increase in the τ lifetime. This idea was proposed in references 1 and 2 where a more complete discussion can be found. The resulting decay rate to a single mode is $\Lambda(\tau^- \rightarrow e^- + \tilde{\nu}_e + \nu_\tau) = G_F{}^2 m_\tau{}^5/192\pi^3\ (1 - ||U_{\tau 4}||^2)$, $\Lambda(\tau^- \rightarrow e^- + \tilde{\nu}_e + \nu_\tau) = BR(\tau^- \rightarrow e^- + \tilde{\nu}_e + \nu_\tau)/\tau_\tau$. Scaling by the muon lifetime gives experimental numbers except for $||U_{\tau 4}||^2\ \tau_\tau/\tau_\mu\ (m_\tau/m_\mu)^5\ (1 - ||U_{\tau 4}||^2) = BR\ (\tau^- \rightarrow e^- + \tilde{\nu}_e + \nu_\tau)$. Using experimental values from K. Hayes (this workshop) gives $(18.92 \pm 0.49)\%(1 - ||U_{\tau 4}||^2) = (17.96 \pm 0.26)\%\ ||U_{\tau 4}||^2 = 0.051 \pm 0.028$. This is the same order as $\sin^2\theta_c$, and is a non-zero value at the 1.7σ level. More accurate measurements of the lifetime and branching ratios of the τ in a τ-charm factory would allow a study of a fourth generation mixing angle, if there is a fourth neutrino heavier than the τ lepton.

29407 (SLAC–343, pp. 406-407) **The τ anomalous magnetic moment measured from the angular dependence of the charged secondary.** Silverman, D. (Univ. of California, Irvine (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The authors examine the angular distributions of the charged secondaries from τ decays into two or three bodies and show that their angular distributions can be used to isolate the effect of an anomalous magnetic moment $F_2(q^2)$ of the τ when it couples to the virtual photon in e^+e^- annihilation. Here, $F_2(0) = a_\tau = (g - 2)/2$. The virtual photon momentum squared is $q^2 = E_{CM}{}^2 = 4E^2$, and $\beta = \sqrt{1 - 4m^2/q^2}$.

29408 (SLAC–343, pp. 436-443) **Backgrounds to τ studies below charm threshold.** Kirkby, J. (CERN, Geneva (Switzerland)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Using DELCO data obtained at SPEAR, the authors evaluate the backgrounds to $\tau^+\tau^-$ data samples below open charm threshold at the τ-charm Factory (τcF). With a single-tagging signature (electron and missing energy, E_{miss}), which is unique to the τcF, the backgrounds are found to be below 0.1%.

29409 (SLAC–343, pp. 444-462) **Leptonic decays of the τ-lepton and the structure of the charged leptonic weak interaction.** Fetscher, W. (Institute for Intermediate Energy Physics, Villigen (Switzerland)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The Lorentz structure of leptonic τ decays cannot be determined by measuring the Michel parameter ρ precisely. It is known from muon decay, however, that the interaction can be fixed by measuring the life-time and four additional parameters yielding information about the lepton chiralities. Two of these, the asymmetry parameters ξ and δ, could be measured at the proposed Tau-Charm-Factory at a c.m. energy of 4 GeV. This would limit five of the ten complex coupling constants. In addition to a more precise measurement of ρ also the low energy spectrum parameter η_μ can be measured with good precision. Its measurement is needed for the test of the universality of the weak interaction.

29410 (SLAC–343, pp. 490-503) **Precision measurements of the τ lifetime.** Kass, R. (Ohio State Univ., Columbus (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. DOE Contract AC02-76ER01545. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

One of the cornerstones of the standard model of electroweak interactions is the universality of the charged coupling constant. For the case of the τ lepton e, μ, τ universality allows us to calculate the lifetime of the τ in terms of the μ mass and lifetime, τ mass and the branching ratio of τ into electrons or muons. Thus a measurement of the τ lifetime is of primary importance as it either affirms the standard model or provides evidence beyond the standard model. In this note they speculate on the opportunities for measuring the τ lifetime at various laboratories over the next few years.

29411 (SLAC–343, pp. 504-518) **τ physics with the TPC/2γ detector at PEP.** Marsiske, H. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The TPC/2γ detector and the PEP machine have been upgraded for high-luminosity running. The authors describe the performance of the new configuration during a test run in fall 1988. Prospects for progress in τphysics, based on a large data sample to be recorded by the TPC/2γ detector, are reviewed.

29412 (SLAC–343, pp. 519-527) **Tau decays to multiphoton final states.** Skwarnicki, T. (Syracuse Univ., NY (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Present status and future prospects of measurements on τ decays to final states with π^0 and η are discussed.

29413 (SLAC–343, pp. 528-537) **Lepton flavor violation and rare tau decays.** Heusch, C.A. (Univ. of California, Santa Cruz (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The author points out that the good statistics promised by the proposed Tau-Charm Factory for tau lepton pair production close to threshold, in combination with the high purity of the tagged sample, opens a window onto new physics phenomena: lepton flavor violation involving the third family of basic fermions may have uniquely

interesting implications not accessible in interactions under scrutiny elsewhere.

29414 (SLAC–343, pp. 538-544) **Can the Higgs sector be probed in Tau-lepton decays?** Haber, H.E. (Univ. of California, Santa Cruz (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

It is unlikely that a high statistics study of τ-lepton decays will be sensitive to the Higgs boson sector of electroweak physics.

29415 (SLAC–343, pp. 545-553) **How to search for an electric dipole form factor of the τ lepton at a τ-charm factory.** Bernreuther, W. (Lawrence Berkeley Lab., CA (USA)); Nachtmann, O. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. DOE Contract AC03-76SF00098. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The authors investigate some CP-odd correlations which can be used to search for an electric dipole form factor $d_\tau(s)$ of the τ in the reaction $e^+e^- \rightarrow \tau^+\tau^-$ at c.m. energies $\sqrt{s}$ relevant for a τ-charm factory. These observables require measurement of the τ polarizations. Using the channel $e^+e^- \rightarrow \tau^+\tau^- \rightarrow \pi^+\bar{\nu}_\tau\pi^-\nu_\tau$ one should be able to measure d_τ at $\sqrt{s} = 4$ GeV with an accuracy $\delta(d_\tau) \simeq 2.5 \times 10^{-16}$e cm, assuming the production of 10^7 τ pairs. The same accuracy can be reached with 10^6 τ pairs at $\sqrt{s} = 10$ GeV, the typical c.m. energy of a B-factory.

29416 (SLAC–343, pp. 554-575) **Multiple-neutral-meson decays of the τ lepton and electromagnetic calorimeter requirements at tau-charm factory.** Gan, K.K. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

This is a study of the physics sensitivity to the multiple-neutral-meson decays of the τ lepton at the Tau-Charm Factory. The sensitivity is compared for a moderate and an ultimate electromagnetic calorimeter. With the high luminosity of the Tau-Charm Factory, a very large sample of the decays $\tau^- \rightarrow \pi^-2\pi^0\nu_\tau$ and $\tau^- \rightarrow \pi^-3\pi^0\nu_\tau$ can be collected with both detectors. However, with the ultimate detector, $2\pi^0$ and $3\pi^0$ can be unambiguously reconstructed with very little background. For the suppressed decay $\tau^- \rightarrow \pi^-\eta\pi^0\nu_\tau$, only the ultimate detector has the sensitivity. The ultimate detector is also sensitive to the more suppressed decay $\tau^- \rightarrow K^-\eta\nu_\tau$ and the moderate detector may have the sensitivity if the hadronic background is not significantly larger than that predicted by Lund. In the case of the highly suppressed second-class-current decay $\tau^- \rightarrow \pi^-\eta\nu_\tau$, only the ultimate detector has sensitivity. The sensitivity can be greatly enhanced with a small-angle photon veto.

29417 (SLAC–343, pp. 589-594) **Supersymmetry and τ decays.** Stroynowski, R. (California Institute of Technology, Pasadena (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

A brief review of the status of searches for supersymmetry involving the τ lepton is given.

29418 (SLAC–343, pp. 595-604) **The τ one-prong problem and recent measurements by the HRS collaboration.** Repond, J. (Argonne National Lab., IL (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The authors summarize recent measurements by the HRS collaboration of the topological branching fractions, the production cross section, the lifetime, and the rate into electrons of the τ lepton. An inconsistency with theoretical expectations persists at the level of two standard deviations.

29419 (SLAC–343, pp. 605-615) **Semileptonic charm decay at a tau charm factory.** Izen, J.M. (Univ. of Illinois, Champaign (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. DOE Contract AC02-76ER01195. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The full spectrum of $D_{\ell 3}$ and $D_{\ell 4}$ semileptonic decays can be precisely measured at a Tau Charm Factory. Sensitivity to rare semileptonic decays extends to branching fractions as small as 10^{-3}. Improved measurements of Cabibbo-Kobayashi-Maskawa matrix elements $V_{cs}$and V_{cd} can be obtained. With an improved theoretical understanding, semileptonic measurements can test the unitarity of the second row of the Cabibbo-Kobayashi-Maskawa matrix at the 1% level.

29420 (SLAC–343, pp. 616-629) **D_s^+ semileptonic decays at a τ-Charm Factory.** Pitman, D. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Preliminary studies of semileptonic D_s^+ decays have been made. The analysis relies on a large sample ($\approx 10^6$) of tagged hadronic D_s^+ events. The Monte Carlo study involved specific decay channels, $D_s^+ \rightarrow \phi e^+\nu_e$ and $D_s^+ \rightarrow K^0e^+\nu_e$, at a center-of-mass energy of 4.03 GeV. Background events due to other D_s^+ modes and to D^0 and D^+ decays are examined. The possibility of signal reconstruction at a center-of-mass energy of 4.14 GeV is investigated.

29421 (SLAC–343, pp. 630-636) **V_{cd} and V_{cs} from current models.** Ward, B.F.L. (CERN, Geneva (Switzerland)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. DOE Contract AS05-76ER03956. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The authors discuss the theoretical uncertainties attendant to the determination of $|V_{cd}|/|V_{cs}|$ from semileptonic D decay. Four different theoretical approaches are considered. Currently, agreement at the level of a factor of 2 for the various theoretical approaches exists so that, indeed, precise experimental data - such as precise lepton energy spectra and decay width data - would discriminate among the models considered.

29422 (SLAC–343, pp. 637-643) **Leptonic and semileptonic d-decays from QCD sum rules.** Paver, N. (University of Trieste (Italy)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Leptonic and semileptonic decay amplitudes play a key role for a determination of the KM quark mixing matrix as well as for a test of a wide variety of theoretical predictions on heavy flavor weak

transitions. Thus considerable effort has been devoted to the theoretical estimates of the leptonic constant f_D (and f_B) and of the Dl_3 (and Bl_3) decay form factors. Here the author briefly presents some results on these transitions, which have been obtained in the framework of QCD sum rules.

29423 (SLAC–343, pp. 644-661) **Unsolved problems in hadronic charm decay.** Browder, T.E. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

This paper describes several outstanding problems in the study of hadronic decays of charmed mesons where further experimental work and theoretical understanding is needed. Four topics are stressed: doubly Cabibbo suppressed decays (DCSD) of D^+ mesons, hadronic D_s decays, weak hadronic quasi-two-body decays to pairs of vector mesons, and penguin decays of D mesons.

29424 (SLAC–343, pp. 662-670) **Physics from doubly quark-mixing suppressed charm meson decays.** Chau, Linglie (Univ. of California, Davis (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Interesting physics and predictions are discussed in the doubly quark-mixing matrix suppressed charm meson decays: into vector-pseudoscalar, pseudoscalar-pseudoscalar, vector-vector mesons.

29425 (SLAC–343, pp. 671-685) **Pure leptonic decays of the D and D_s mesons.** Kim, P.C. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

This report presents a feasibility study of the pure leptonic decays of charmed mesons at a Tau-Charm Factory. A year of running with a luminosity of 10^{33} cm^{-2} sec^{-1} would allow precise measurement of f_D and f_{D_s} at a percent level, providing a benchmark test of Lattice QCD calculations. Possible observation of mass-dependent couplings in D_s decays to $\tau\nu$ and $\mu\nu$ is also discussed.

29426 (SLAC–343, pp. 686-694) **Flavor changing neutral processes bounded by B_d^0 - $\bar{B}_d^0$ mixing and predictions for the Tau-Charm Factory.** Shin, M. (Univ. of California, Irvine (USA)); Bander, M.; Silverman, D. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

In our present understanding of particle physics, there is one potentially important piece of experimental data whose explanation may require new physics beyond the standard model. It is the surprisingly large B_d^0 - $\bar{B}_d^0$ mixing reported by the ARGUS collaboration, which has been confirmed by the CLEO collaboration. In this talk, the authors propose that this mixing is due to or is bound to tree-level flavor changing couplings of the standard model Higgs scalar, H^0, or the Z^0, induced by new physics beyond the standard model. A more complete treatment of this by these authors is in refs. 3 and 4. In sec. 2, they present an illustrative example, based on new heavy weak-isospin singlet heavy quarks, where physics beyond the standard model could be responsible for such flavor changing neutral current processes (FCNP) of the known quarks and leptons. In Sec. 3, they look at various theoretical expectations for the flavor dependence of these couplings. In Sec. 4, they assume that the large B_d^0 - $\bar{B}_d^0$ mixing is due to such FCNP and this anchors one of these couplings. They then analyze all relevant processes using the assumptions on the dependence of the couplings on quark or lepton masses from Sec. 3. The results are pleasing in that not only are the bounds not seriously violated, but several unseen reactions are on the verge of observability. In this talk they focus on those that are relevant for the τ-charm factory.

29427 (SLAC–343, pp. 695-705) **CP noninvariance: A charm possibility.** Chau, Linglie (Univ. of California, Davis (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

CP noninvariance in charm meson decays is discussed in comparison to that in the B and K mesons. It is pointed out that in the case of higher than three generations of quarks, CP nonvariance effects can be substantial in charm decays. It is also pointed out how inclusive semileptonic decays can be used to measure $D^0\bar{D}^0$ mixing and mass-matrix CP noninvariance.

29428 (SLAC–343, pp. 706-723) **Monte Carlo study of CP asymmetry measurement at a Tau-Charm Factory.** Karshon, U. (Stanford Univ., CA (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

It is shown that, for $D^0\bar{D}^0$ mixing of order $\sim$ 1%, it may be possible to observe in a Tau-Charm Factory a CP violation effect in the D^0 $\bar{D}^0$ system via a CP asymmetry. The method used is to tag one D by its semi-leptonic decay and to look for decays of the other D into CP eigenstates. It is estimated that within 1 year of running at the designed luminosity of L = 1033 cm^{-2} sec^{-1}, $\sim$ 6,600 such events can be collected.

29429 (SLAC–343, pp. 724-732) **A study of rare D decays for the Tau-Charm Factory.** Stockdale, I.E. (Univ. of Cincinnati, OH (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The authors present a study of the sensitivity to rare D decays of a Tau-Charm Factory detector. The authors consider both flavor changing neutral currents and family number violating decays, and evaluate the impact of varying the solid angle coverage, lepton identification and neutral hadron identification of the detector. They find that stringent demands must be made on the detector design in order to effectively use the expected data sets to observe small signals (branching fractions $\sim 10^{-7}$ - 10^{-8}) at a five standard deviation level of statistical significance.

29430 (SLAC–343, pp. 733-741) **Physics at the ψ(2S).** Burnett, T.H. (Univ. of Washington, Seattle (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The ψ(2S) hides some potentially interesting secrets that could be explored in only a day, given the high luminosity of the τcF, and the good acceptance of the proposed detector. The author will examine the puzzle of the suppressed hadronic decays to a vector and a pseudoscalar, the as yet unconfirmed h_{c1} and $\eta_c(2S)$ charmonium states, and speculation on the hadronic decays of the χ_{c0}, and examine J/ψ physics that could be done at the ψ'.

29431 (SLAC–343, pp. 742-748) **Open topics in charmonium physics.** Mir, R. (Univ. of Washington, Seattle (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The current status of the charmonium system is reviewed. Several interesting issues are discussed: the absolute branching ratio of $\Psi' \to \gamma\eta_c$ and $\Psi' \to \gamma\eta_c'$; the full width and the $\gamma\gamma$ width of the η_c and η_c'; the three photon decay of the Ψ; and hadronic decays of the η_c. Predictions for the rates of these processes at a future Tau Charm Factory are presented.

29432 (SLAC–343, pp. 749-762) **Tasks in η_c physics.** Heusch, C.A. (Univ. of California, Santa Cruz (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The design luminosity for the Tau/Charm Factory suggests the collection of 10^6 (10^7) events within one month (year), where the vector charmonium ground state decays radiatively to the pseudoscalar ground state. The authors point up physics possibilities that become accessible through these parameters.

29433 (SLAC–343, pp. 763-778) **Scalar and tensor meson spectroscopy at a τ-charm factory.** Bolton, T. (Columbia Univ., Irvington, NY (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

While the clear identification of a glueball would be universally accepted as a fundamental discovery, all such searches have thus far produced ambiguous results. Simplified analyses based on low statistics data samples collected with low acceptance detectors have possibly introduced as much confusion as understanding. However, there is a correct way to do spectroscopy, especially in the two pseudoscalar channel. Several ingredients are necessary: high statistics - $\sim$ 1,000 events per 25 MeV/c^2 mass bin- to make partial wave analyses statistically meaningful; high acceptance - $\gtrsim$ 95% of the 4π solid angle- so that spin analyses are not confused; a clean and well-understood production mechanism, to both aid the analysis and assist in the interpretation; the ability to simultaneously study as many final states as possible to allow cross checking of results and to assist in their interpretation. For the remainder of this report, it will be shown that each of these requirements can be met by building the appropriate detector at a τ-charm factory and adopting the right approach to analyzing the data.

29434 (SLAC–343, pp. 800-815) **The Iota in radiative J/ψ decays.** Burchell, M. (Univ. of California, Santa Cruz (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Given the OZI suppression of strong J/ψ decays, the electromagnetic decays are equally accessible. Radiative J/ψ decays (see figure 1) offer a particularly clean environment for searches for light mesons. Several experiments (MarkII, Crystal Ball, DM2 and MarkIII) have accumulated large samples of J/ψ decays at rest and have searched for decay modes down to branching ratios of some 10^{-4}. Clean. strong signals are seen for many mesons of interest. One of the glueball candidate states that has emerged in the last 10 years or so is the iota (mass around 1,440 MeV/c^2, width 40 → 80 MeV/c^2). This is seen very well in radiative J/ψ decays in the KKπ final state. Below the authors reviews the reported observations of this state, then, using MarkIII data, he discusses the current status of their studies of the iota and also point to future directions for such work at a high statistics (10^9 J/ψ/month) τ-charm factory.

29435 (SLAC–343, pp. 816-828) **Production of $Q^2\bar{Q}^2$ states.** Li, Bingan. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

In this talk, the productions of $Q^2\bar{Q}^2$ states in two-photon collision and J/ψ radiative decays are discussed.

29436 (SLAC–343, pp. 829-835) **Scalar meson spectroscopy in hadronic J/ψ decays at a τ-charm factory.** Lockman, W.S. (Santa Cruz Institute for Particle Physics, CA (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The low-multiplicity vector-P$\bar{P}$ final states are inherently straightforward to analyze and are nearly background-free. Excellent π-K-p separation can be achieved using current-technology time-of-flight and dE/dX systems, together with kinematic fitting, due to the relatively low momenta involved (0.3-1.0 GeV/c). The particle identification requirements are even less severe here than in the corresponding radiative decays, because the vector mesons are massive. In most regions of P$\bar{P}$ mass, present analyses are handicapped by limited statistics and incomplete tracking, calorimetric and particle identification solid-angle coverage. The author reviews the present knowledge of nonradiative 0^{++} isoscalar production into the P$\bar{P}$ final state, and indicate how a τ-Charm Factory experiment will help to solve some of the outstanding experimental questions. The radiative decays are presented by T. Bolton at this conference.

29437 (SLAC–343, pp. 836-845) **Coupled channel interactions in J/ψ → V[PP]S-wave.** Weinstein, J. (Univ. of Tennessee, Knoxville (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The author review the model which lead us to the concept of the K$\bar{K}$ Molecule and show how it can be extended to apply to S-wave pseudoscalar-pseudoscalar production spectra such as those seen in J/ψ → V[PP]S-wave. The author presents some preliminary results of this analysis.

29438 (SLAC–343, pp. 846-872) **Strangeonium spectroscopy at the J/ψ: A comparison with kaon hadroproduction.** Ratcliff, B.N. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144–: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

An experimental program to study strangeonium mesons produced in the decays of the J/ψ at a τ-charm factory is compared with experiments on similar final states in kaon hadroproduction. The sample sizes and experimental performance required are discussed. The complementarity of different production modes and the importance of a broad programmatic approach to this physics are stressed.

29439 (SLAC–343, pp. 873-908) **Tests of quantum chromodynamics in exclusive e^+e^- and $\gamma\gamma$ processes.** Brodsky, S.J.

Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144--: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

Few-body exclusive reactions initiated by electromagnetic initial states is one of the most important areas of investigation in quantum chromodynamics. This report discusses electron-positron and two-photon processes. Factorization theorem for exclusive processes is presented. Other topics in this report include; electromagnetic form factors of baryons, suppression of final state interactions, the gamma-pi_0 transition form factor, exclusive charmonium decays, the π-ρ puzzle, time-like compton processes, multi-hadron production, heavy quark exclusive states and form factor zeros in QCD, exclusive gamma-gamma reactions, higher twist effects, and tauonium and threshold tau^+tau^- production.

29440 (SLAC–343, pp. 911-929) **Central tracking design for a τ-charm factory.** Weinstein, A.J. (California Institute of Technology, Pasadena (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144--: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The authors discuss the considerations involved in the design of a central tracking system for a τ-Charm Factory, including the required momentum resolution, angular coverage, material contributing to multiple scattering, and a variety of other issues. These ideas were discussed during meetings of the Tracking Working Group at the τ-Charm Factory Workshop at the Stanford Linear Accelerator Center in May, 1989.

29441 (SLAC–343, pp. 930-939) **Particle identification using dE/dx technique.** Va'vra, J. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144--: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

The author has calculated the dE/dx particle identification prediction for two cases, one assuming that the central drift chamber has 60 samples 1 cm long operating at 1 atm gas pressure, and the other assuming a special dedicated dE/dx module with only 20 samples 1 cm long and a dedicated dE/dx gas. The attempt was to compare standard gases with helium based gases. To calculate this problem one needs to determine two quantities. First, the most probable energy loss (as a function of particle velocity, gas and the detector parameters), and second, the energy loss fluctuations as a function of similar parameters. The knowledge of these two quantities allows one to calculate the two particle separation in terms of a number of sigmas as a function of momentum.

29442 (SLAC–343, pp. 940-955) **Design considerations for a Cerenkov Ring Imaging detector at the Tau-Charm factory.** Ratcliff, B.N. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144--: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

A schematic design of a Cerenkov ring imaging detector for use at a τ-charm factory is described. The performance of this device and its implications for the other parts of the spectrometer are discussed.

29443 (SLAC–343, pp. 956-962) **Time of flight technique.** Stroynowski, R. (California Institute of Technology, Pasadena (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. (CONF-8905144--: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

At first glance, the traditional Time of Flight (TOF) technique for identification of pions, kaons and protons seems to be ideally suited for the momentum range of particles produced at the Tau-Charm Factory. In the decays of τ leptons and charmed mesons most of the secondaries have momentum smaller than 1 GeV/c. The exception are the two- and three-body decays of ψ and ψ' where the region of interest extends to about 1.5 GeV/c. In the upper end of this momentum range the geometry of the detector will impose strict requirement on the necessary timing resolution.

29444 (SLAC–343, pp. 963-966) **τ-charm factory (τCF) data acquisition and offline requirements.** Sliwa, K. (Tufts Univ., Medford, MA (USA)). Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. DOE Contract AC02-83ER40085. (CONF-8905144--: Tau-Charm Factory workshop, Stanford, CA (USA), 23-27 May 1989). In *Proceedings of the tau-charm factory workshop. Study of tau, charm and J/ψ physics; development of high luminosity e^+e^- rings; design of e^+e^- detectors for tau-charm physics.* Order Number DE90001785. Available from NTIS, PC A99/MF A01.

A single most important factor one has to consider while designing an offline reconstruction system, and similarly in the case of an on-line trigger, is its bandwidth. A priori, if there were no limitations to the number of bytes of data that one can push to (and from) the computer CPUs, one could - by multiplying the number of processors - reduce the clock processing time to an (almost) arbitrarily small value. In general, if a Data Acquisition (DAQ) System is capable of pushing N events per second across a bus while utilizing a fraction F of its bandwidth, one can process in an offline system based on the same single bus (and assuming the size of an output event equal to the size of an input one) M { <=} N/(2*F) events per second. A number of parallel computers (nodes) required in such a system is K = M*t, t being reconstruction time per event in the node used. To go beyond M, one has to multiply the number of complete systems (buses). It is no longer difficult to provide sufficient CPU power to reconstruct the data fast. The τ-Charm Factory should benefit from the experience of several large experiments presently underway - CDF, LEP experiments, D0, high rate fixed target at FNAL, CEBAF - in designing its offline structure and programming environment in a much more user friendly way than it has been done in the past. The author considers this the biggest challenge facing the τCF Offline Group. Many of the answers to those organizational questions may become known within the next few years, hopefully in time for the τCF to benefit from them.

Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This talk deals with Λ, K_s^0 and $\bar{\Lambda}$ production with 14.5 GeV/c Silicon beams. Why study Λ^0 production? Because the study of strangeness is an important part of the search for Quark Gluon Plasma (QGP). Many models predict an enhancement of strangeness in a QGP as compared to the amount of strangeness produced in a superposition of nucleon-nucleon interactions. The

amount of enhancement varies from model to model. Even if no QGP is detected at AGS energies using Si beams, it is important to understand the production mechanisms in quantitative detail so that standard nucleon-nucleon production mechanism can be distinguished from QGP formation. The advantage of measuring strangeness production by measuring V^0 production is that V^0's can be identified by kinematics without the use of any special particle ID detectors. The disadvantage is that usually large aperture detectors are required. Experiment 810 has the needed large aperture. This talk describes the technique and results of V^0 production from ~9000 interactions of Si in a 1 mil (25 micron) Au target recorded in June 1989. 13 figs., 1 tab.

29446 (KEK–89-7) **Proceedings of workshop on K-decay experiments.** Nakai, Kozi (ed.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1989. 246p. (In Japanese). (CONF-8907188–: Workshop on K-decay experiments, Tsukuba (Japan), 11-12 Jul 1989). Order Number DE90777890. Available from NTIS (US Sales Only), PC A11/MF A01.

The elementary particle experiment using the 12 GeV proton synchrotron in the National Laboratory for High Energy Physics (KEK) develops centering around the large scale experiment on K-meson decay. In this case, the ideal precision physics is pursued, and efforts have been exerted to improve the experimental techniques. At present the experiment on searching for rare K-decay is advancing. Next, the experiment on searching for CP nonconservation process will be begun. However, these experiments are in severe competition with those in BNL and Fermilab which have powerful accelerators, therefore it is desirable to grasp well the development of the international research plans. Therefore, in order to obtain the quideline for the experimental plan using the KEK proton synchrotron hereafter, the workshop on K-decay was held on July 11≈12, 1989. In this workshop, Arisaka (UCLA), Numao (TRIUMF) and Yamanaka (Fermilab) returned from USA and lectured on the present status of the experiment and the future perspective. The impression of the planner of the proton synchrotron experiment plan on the experiments are recorded. (K.I.).

29449 (UIUC-HEPG–90-56) **Hadroproduction of $D_s^+ \rightarrow (K\pi)\pi$.** Kroc, T.K. Illinois Univ., Urbana, IL (USA). Dept. of Physics. 1989. 152p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76ER01195. Order Number DE90009954. Available from NTIS, PC A08/MF A01; OSTI; INIS; GPO Dep.

A study of the decay $D_s^+ \rightarrow (K^- \pi^+)\pi^+$ (and charge conjugate) has been performed based on data taken from n-nucleus collisions by the experiment E400 at the Proton East area of FNAL. A signal was observed at the 3.3σ level that behaves properly under lifetime cuts. A method for determining the acceptance due to spectrometer geometry and analysis cuts was developed with the intention of making the acceptance as independent as possible of biases resulting from the production model chosen for the Monte Carlo studies that determined the acceptance. The acceptance was parameterized in two different ways chosen so that inconsistencies would expose any remaining model dependence. The cross-sections resulting from these two parameterizations were consistent and the average of the two is $\Delta\sigma$. Br = 2.36 ± .72 (statistical) ± 1.18 (systematic) over the range $-.02 < x_F < .3$. A comparison is made between this cross-section and the cross-section found for the decay $D_s \rightarrow (K^+ K^-)\pi$, also measured by E400 over the more limited range $0. < x_F < .14$ and the two values are found to be statistically consistent. The cross-section from $D_s \rightarrow (K\pi)\pi$ is compared to cross-sections determined by LERC, an experiment also using a hadron beam of energy similar to E400, with considerable disagreement although no explicit explanation is readily available. Both experiments, as well as many others, measure cross-sections that are considerably larger than lowest order QCD calculations. 41 refs.

29450 (UWThPh–1989-44) **Intermittency in multihadron production: An analysis using stochastic theories.** Biyajima, M. (Shinshu Univ., Matsumoto, Nagano (Japan). Dept. of Physics. Faculty of Liberal Arts); Bartl, A.; Mizoguchi, T.; Suzuki, N. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1989. 12p. Order Number DE90623761. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Multiplicity data of the NA22, KLM, and UA1 collaborations are analysed by means of probability distributions derived in the framework of pure birth stochastic equations. The intermittent behaviour of the KLM and UA1 data is well reproduced by the theory. A comparison with the negative binomial distribution is also made. 19 refs., 3 figs., 1 tab. (Authors).

29451 Improved limit on the branching ratio of $K^+ \rightarrow \pi^+ \mu^+ e^-$. Lee, A.M.; Alliegro, C.; Campagnari, C.; Chaloupka, V.; Cooper, P.S.; Egger, J.; Gordon, H.A.; Hadley, N.J.; Herold, W.D.; Jagel, E.A. *Physical Review Letters (USA),* 64(2): 165-168 (8 Jan 1990). DOE Contract AC02-76CH00016;AC02-76ER03075.

A search for the lepton-flavor number-violating decay $K^+ \rightarrow \pi^+ \mu^+ e^-$ has been conducted at the Brookhaven Alternating Gradient Synchrotron. No candidates have been found which would be consistent with this decay mode. An upper limit on the branching ratio is placed at 2.6×10^{-10}, which can be combined with our previous result to yield an upper limit of 2.1×10^{-10} at the 90% confidence level. A limit on the branching ratio for $\pi^0 \rightarrow \mu^+ e^-$ of 1.6×10^{-8} (90% C.L.) is also established.

29452 Investigation of the electromagnetic structure of η and η' mesons by two-photon interactions. Aihara, H.; Alston-Garnjost, M.; Avery, R.E.; Barbaro-Galtieri, A.; Barker, A.R.; Barnett, B.A.; Bauer, D.A.; Bay, A.; Bobbink, G.J.; Buchanan, C.D. TPC/Two-Gamma Collaboration. *Physical Review Letters (USA),* 64(2): 172-175 (8 Jan 1990).

The TPC/Two-Gamma facility at the SLAC e^+e^- storage ring PEP was used to study the reactions $\gamma\gamma^* \rightarrow \eta$ and $\gamma\gamma^* \rightarrow \eta'$. The $\eta\gamma^*\gamma$ and $\eta'\gamma^*\gamma$ transition form factors were measured as functions of Q^2, the negative of the invariant mass squared of the tagged photon, in the range $0.1 < Q^2 < 7$ GeV^2. These determinations of the electromagnetic structure of the η and η' mesons are consistent with both vector-meson dominance and QCD. They also provide new measurements of the pseudoscalar mixing angle and decay constants.

29453 Results on hadronic decays of D and D_s mesons from Mark III. Kim, P.C. (Stanford Linear Accelerator Center, Stanford University, Stanford, CA (US)). Mark III Collaboration. *AIP Conference Proceedings (American Institute of Physics) (USA),* 196(1): 203-209 (15 Dec 1989). DOE Contract AM03-76SF00010;AC02-76ER01195;AC03-81ER40050;AC02-(CONF-8906204–: International symposium on heavy quark physics, Ithaca, NY (USA), 13-17 Jun 1989).

Recent results on hadronic weak decays of the charmed mesons, $D^0 \rightarrow \bar{K}^0\pi^0$, $\bar{K}^0\eta$, $\bar{K}^0\eta'$ and $D_s^+ \rightarrow \eta\pi^+$, $\eta'\pi^+$, from the Mark III at SPEAR are presented.

29454 Status of the top quark search at CDF. Foster, G.W. CDF Collaboration. *AIP Conference Proceedings (American Institute of Physics) (USA),* 196(1): 354-366 (15 Dec 1989).

(CONF-8906204–: International symposium on heavy quark physics, Ithaca, NY (USA), 13-17 Jun 1989).

A search for new heavy quarks is proton-antiproton collisions at the Fermilab Tevatron Collider ($\sqrt{s}$=1.8 TeV) is described. Primary emphasis is given to the search for final states in which the charged-current decays of a $t\bar{t}$ pair produce both an electron and a muon. The data taken during the first portion (2.0 pb^{-1}) of the 1988–1989 run is analysed. The top quark (as well as a fourth generation b' quark) is excluded at the 95% C. L. in the mass range 30 to 60 GeV/c^2. Other prospects for heavy quark physics at CDF are discussed.

29455 Predictions for CP violation. Gilman, F.J. (Stanford Linear Accelerator Center, Stanford University, Stanford, CA 94309 (US)). *AIP Conference Proceedings (American Institute of Physics) (USA)*, 196(1): 367-384 (15 Dec 1989). DOE Contract AC03-76SF00515. (CONF-8906204–: International symposium on heavy quark physics, Ithaca, NY (USA), 13-17 Jun 1989).

Predictions for CP violation in the three-generation Standard Model are reviewed, especially as they pertain to the K and B meson systems.

29456 Two-photon production of the η_c. Jensen, T. (The Ohio State University, Columbus, OH 43210 (US)). *AIP Conference Proceedings (American Institute of Physics) (USA)*, 196(1): 325-330 (15 Dec 1989). DOE Contract AC02-76ER01545. (CONF-8906204–: International symposium on heavy quark physics, Ithaca, NY (USA), 13-17 Jun 1989).

A brief review of two-photon production of the η_c is given. Preliminary results from the CLEO experiment are presented and shown to be in good agreement with theoretical predictions.

29457 Study of Ψ' decays. Toki, W.H. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94309 (US)). Mark III Collaboration. *AIP Conference Proceedings (American Institute of Physics) (USA)*, 196(1): 317-324 (15 Dec 1989). DOE Contract AM03-76SF00326;AC02-76ER01195;AC03-81ER40050;AC02- (CONF-8906204–: International symposium on heavy quark physics, Ithaca, NY (USA), 13-17 Jun 1989).

Hadronic decays of the Ψ' are reviewed and a new preliminary upper limit of $B(\Psi' \to \rho\pi) < 7.0 \times 10^{-5}$ at 90% C.L. from the Mark III is presented.

29458 (CEA-CONF–9578) **Topological objects in hadron physics.** Rho, M. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique. 1988. 20p. (CONF-8805140–: International conference on medium- and high-energy nuclear physics, Taipei (Taiwan), 23-27 May 1988). Order Number DE90770197. Available from NTIS (US Sales Only), PC A03/MF A01.

The notion of topological objects in hadronic physics is discussed, with emphasis on the role of the Wess-Zumino term and induced transmutation of quantum numbers in chiral bag models. Some applications to nuclear systems are given.

29459 (FNAL/C–90/43-T) **Report of the Electroweak Interactions Theoretical Issues Working Group.** Golden, M. Fermi National Accelerator Lab., Batavia, IL (USA). Nov 1989. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890872–11: Workshop on physics at Fermilab in the 1990's, Breckenridge, CO (USA), 15-24 Aug 1989). Order Number DE90009573. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

An interesting component of the physics program at Fermilab during the next ten years will be the precision verification of the standard model, rather than its extension. While there is a window for finding Z' gauge bosons, it is unlikely that it is possible to discover the standard model Higgs boson. Measurements of $W + \gamma$ rates can place limits on non-standard gauge boson couplings. QCD will be further tested by observation of W or Z plus multiple jets, a signal which is also interesting as a background to new particle searches. Precision measurements of the W and Z masses and the forward-backward asymmetry in Z decays can put limits on new physics. 26 refs., 1 fig., 2 tabs.

29460 (FNAL/C–90/57-T) **Minimal dynamical symmetry breaking of the electroweak interactions and m_{top}.** Hill, C.T. Fermi National Accelerator Lab., Batavia, IL (USA). Mar 1990. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-900135–1: General meeting of the Division of Particles and Fields of the American Physical Society, Houston, TX (USA), 3-6 Jan 1990). Order Number DE90009574. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We review the recent idea of a mechanism for breaking the electroweak interactions which relies upon the formation of condensates involving the conventional quarks and leptons. In particular, such a scheme would indicate that the top quark is heavy, greater than or of order 200 GeV, and gives further predictions for the Higgs boson mass. It may be imbedded either into a GUT setting using supersymmetry or applied to a fourth generation with new strong TEV scale flavor-interactions. 13 refs., 2 tabs.

29461 (HEPHY/PUB–527) **Phenomenological aspects of nonrelativistic potential models.** Lucha, W. (Oesterreichische Akademie der Wissenschaften, Vienna (Austria). Inst. fuer Hochenergiephysik); Schoeberl, F.F. Oesterreichische Akademie der Wissenschaften, Vienna (Austria). Inst. fuer Hochenergiephysik. 1989. 45p. (UWThPh–1989-71). Order Number DE90623708. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

This review reports on the description of hardrons as bound states of quarks by nonrelativistic potential models. It contains a brief sketch of the way in which information on the form of the inter-quark potential may be gained from quantum chromodynamics, proofs of some general theorems related to the potential-model approach, a discussion of the significance of the treatment of bound states consisting of relativistically-moving constituents by the nonrelativistic Schroedinger formalism, as well as a brief survey of the motivations for the various proposed potential models. Finally, it illustrates the application of the developed theoretical framework at a few selected examples. 60 refs., 8 figs., 17 tabs. (Authors).

29462 (INS–785) **Deeply bound pionic states.** Yamazaki, Toshimitsu. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Nov 1989. 9p. Order Number DE90777709. Available from NTIS (US Sales Only), PC A02/MF A01.

We discuss the structure and formation of deeply bound π^- states in heavy nuclei, which are expected to be narrow due to the repulsive π^--nucleus interaction. Possible experiments to produce those states are described. (author).

29463 (INS–789) **Triplicity of hadrons, quarks and subquarks.** Terazawa, Hidezumi. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Nov 1989. 14p. Order Number DE90777712. Available from NTIS (US Sales Only), PC A03/MF A01.

Triplicity of hadrons, quarks and subquarks asserting that a certain physical quantity such as the weak current is taken equally well as either one of a composite operator of hadrons, that of quarks and that of subquarks is proposed. Among other things, the weak mixing angle, the quark mixing matrix and the mass sum rules for quarks and leptons are revisited, reinterpreted and discussed in detail in triplicity. (author).

29464 (INS–791) **Effects of exotic composite bosons in the TRISTAN, SLC and LEP region.** Akama, Keiichi (Saitama Medical Coll., Moroyama (Japan). Dept. of Physics); Hattori, Takashi; Yasue, Masaki. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Nov 1989. 17p. Order Number DE90777713. Available from NTIS (US Sales Only), PC A03/MF A01.

Starting with typical dynamical composite models for exotic bosons as well as weak bosons, we derive their effective interactions, examine the restrictions from the presently known

experimental results, and estimate possible effects on e^+e^- scattering. Some of the neutral exotics in the composite model, which decouple from neutrinos at low energies, can be as light as the order of the weak boson masses and offer the possibility of detecting sizable effects in the TRISTAN, SLC and LEP energy region. (author).

29465 (INS–796) **Studies of deeply bound pionic states by (d, ^{2}He) pion-transfer reactions at SATURNE.** Yamazaki, T. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Nov 1989. 10p. Order Number DE90777715. Available from NTIS (US Sales Only), PC A02/MF A01.

We propose to search for deeply bound π^- states in heavy nuclei by high resolution spectroscopy using (d, ^{2}He) reactions on heavy targets such as ^{208}Pb. Recent calculation by Toki and Yamazaki shows that even in ^{208}Pb the deeply bound pionic states (1s, 2p, etc.) are expected to have narrow widths due to the repulsive nature of the pion-nucleus interaction. To populate those states they proposed to use 'pion transfer' reactions such as (n, pπ^-). The experiment proposed here is to measure the (d, ^{2}He) spectrum around 140 MeV excitation, which lies in a valley between the nuclear GT and the Δ excitation regions. (author).

29466 (Juel-Spez–526) **Pion-pion and pion-kaon interaction in the meson exchange picture.** Lohse, D. Kernforschungsanlage Juelich GmbH (Germany, F.R.). Inst. fuer Kernphysik. Oct 1989. B78 (In German). Order Number DE90780369. Available from NTIS (US Sales Only), PC A05/MF A01.

Following the general line of the Bonn NN-interaction, a model for pseudoscalar-pseudoscalar meson interaction has been constructed and applied consistently to $\pi\pi$ and Kπ scattering. The phases can be reproduced with vector meson t- and s-channel exchange up to 1 GeV. The bare masses of the vector mesons turn out to be in the range of 1.1 GeV, depending on the form factor. We use a coupled channel formalism, which is crucial to explain the S* (975) resonance as a bound anti KK state. Beyond 1 GeV the data require a pseudoscalar-pseudoscalar coupling to a scalar octet (J^P=0$^+$) to fit the s-wave phases in the isospin-0 π and isospin-1/2 Kπ channels. We apply both scalar coupling and derivative coupling. The latter avoids introducing additional degrees of freedom and produces an acceptable fit to the J=0 phase shift data. (orig.).

29467 (Juel-Spez–527) **Antikaon-nucleon interaction in the meson exchange picture.** Mueller-Groeling, A. Kernforschungsanlage Juelich GmbH (Germany, F.R.). Inst. fuer Kernphysik. Oct 1989. 149p. (In German). Order Number DE90780368. Available from NTIS (US Sales Only), PC A07/MF A01.

Within the meson exchange framework of the Bonn NN-potential a model for the anti KN interaction near threshold is constructed. Employing a coupled-channels formalism we calculate total cross sections for six particle channels (pK$^-$, nanti K^0, $\Lambda\pi^0$, $\Sigma^0\pi^0$, $\Sigma^+\pi^-$, $\Sigma^-\pi^+$) and the Λ(1405) mass spectrum. The close connection between KN and anti KN diagrams due to G-parity conservation is exploited in order to examine the nature of short-range repulsion in the KN system. Our investigation suggests that this repulsion is not entirely due to ω-exchange but in addition consists of so far unknown processes of mixed G-parity. Furthermore, fourth-order contributions to the anti KN potential are shown to provide an important isospin dependent part of the interaction while Coulomb corrections turn out to be small, but not totally negligible. Our model definitely predicts Λ(1405) to be a anti KN quasibound state. The observed mass spectrum is reproduced without the inclusion of a genuine three quark state. Therefore we consider Λ(1670) to be the first excited 1/2$^-$ state of the uds-system and include corresponding pole graphs in our model. (orig.).

29468 (KEK–89-13, pp. 63-73) **Origin of CP violation.** Yamaguchi, Yoshio (Tokai Univ., Hiratsuka, Kanagawa (Japan). Faculty of Science). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Oct 1989. (In Japanese). (CONF-8903201–: 2. KEK symposium on ultracold neutrons (UCN) and fundamental physics with slow neutrons, Tsukuba (Japan), 11 Mar 1989). In *The 2nd KEK symposium on ultracold neutrons (UCN) and fundamental physics with slow neutrons.* Order Number DE90760025. Available from NTIS (US Sales Only), PC A07/MF A01.

The 2π decays of the K_L-meson, a unique and clear-cut evidence for CP violation, demonstrate an existence of C conserving but P violating and CP violating interaction $H_X{}^C$. This new interaction $H_X{}^C$ is flavor conserving and its effective strength is $\approx 10^{-3}$ of that of strong interaction. Implication of $H_X{}^C$ in particle and nuclear physics and nature of the spinless force carrier of $H_X{}^C$ are briefly described. (author).

29469 (MPI-PAE/Exp.El.–196) **Uncertainties in τ polarization measurement at SCL/LEP and QED/electroweak radiative corrections.** Boillot, F. (Ecole Polytechnique, 91 - Palaiseau (France). Lab. de Physique Nucleaire et des Hautes Energies); Was, Z. Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.). Werner-Heisenberg-Inst. fuer Physik. Nov 1988. 31p. Contract CPBP 01.09. Order Number DE90780364. Available from NTIS (US Sales Only), PC A03/MF A01.

We discuss the τ polarization measurement at SLC/LEP energies as a data point in the precision tests of the Glashow-Salam-Weinberg model. Theoretical and experimental uncertainties of this measurement are examined and it is concluded that apart from left-right asymmetry measurement, and for typical values of the parameters of the Standard Model, the τ polarization offers the best probe of the couplings of leptons to the Z^0. In particular, the dependence of the τ polarization on the top and Higgs masses is discussed. The interplay of QED initial state bremsstrahlung and other classes of radiative corrections is also discussed. (orig.).

29470 (NBI-HE–89-57) **Electroweak magnetism: Theory and applications.** Ambjoern, J.; Olesen, P. Niels Bohr Inst., Copenhagen (Denmark). Dec 1989. 34p. Order Number DE90623688. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The classical electroweak theory is unstable for magnetic fields H satisfying $eH > m_w{}^2$, m_w being the W mass. We discuss the origin of this instability and the peculiar anti-screening property of the W-condensate formed. The anti-screening is closely related to the asymptotic freedom of the $SU(2)_w$-fields. Assuming that the Higgs mass $m_h > m_w$ there will be a restoration of $SU(2)_w \times U_y(1)$ symmetry for $eH > m_h{}^2$. By using Bogomol'nyi's method in the special case where the mass of the Z-particle $m_z = m_h$ we can find static magnetic solutions with a vacuum condensate of W- and Z-bosons. This class of non-perturbative solutions interpolate between the constant magnetic field in the broken phase ($eH < m_w{}^2$) and a constant $U_y(1)$ field in the symmetric phase ($eH > m_h{}^2$). The consequences of this magnetic instability are discussed in the cases of superconducting cosmic strings, high temperatures (the early universe) and high energy collisions. (orig.).

29473 (RRK–89-33) **Role of exotic mesons in nonleptonic weak decays of strange and charm mesons.** Terasaki, K.; Oneda, S. Hiroshima Univ., Takehara (Japan). Research Inst. for

Theoretical Physics. Dec 1989. 26p. Order Number DE90777765. Available from NTIS (US Sales Only), PC A03/MF A01.

Typical nonleptonic weak decays of strange and charm mesons are studied from the approach in which dynamical features of hadrons are dealt with in earnest. The amplitudes are always cast into the form $M \simeq M_{ETC} + M_S$ by using a hard PS-meson extrapolation. M_S, which can then be regarded as the Born term, is described by the sum of pole amplitudes involving the contributions from not only the ordinary {QQ-bar} but also the exotic [QQ][Q-barQ-bar] and (QQ)(Q-barQ-bar) mesons and a glue-ball. In particular, the persistent puzzle of the ratio, $\Gamma(D^0 \rightarrow K^+K^-)/\Gamma(D^0 \rightarrow \pi^+\pi^-) \simeq 2\text{-}5$, can be solved. Simultaneously, the contribution of the (QQ)(Q-barQ-bar) mesons explains why the violation of the $|\Delta I| = 1/2$ rule is small in the $K \rightarrow \pi\pi$ decays, while its charm counterpart is violated strongly. (author).

29474 (RRK–89-34) **Unified approach to weak decays of strange and charm mesons into two pseudoscalar mesons and the role of exotic mesons.** Terasaki, K.; Oneda, S. Hiroshima Univ., Takehara (Japan). Research Inst. for Theoretical Physics. Dec 1989. 39p. Order Number DE90777764. Available from NTIS (US Sales Only), PC A03/MF A01.

Basic nonleptonic weak decays of strange and charm mesons into two PS-mesons are studied. The amplitudes are cast into the form $M \simeq M_{ETC} + M_S \cdot M_{ETC}$ has now to be evaluated in the infinite momentum frame. M_S is described by the sum of asymptotic pole amplitudes and receives contributions from not only the ordinary {QQ-bar} mesons but also the exotics, i.e., [QQ][Q-barQ-bar] and (QQ)(Q-barQ-bar) mesons and glue-balls, etc. The contribution of the (QQ)(Q-barQ-bar) mesons explains why the violation of the $|\Delta I| = 1/2$ rule is small in the $K \rightarrow \pi\pi$ decays, while its charm counterpart is violated strongly. Glue-balls with $J^{PC} = 0^{++}$ can also play an interesting role in the Cabibbo-angle suppressed decays of the D^0 meson. The persistent puzzle of the ratio, $\Gamma(D^0 \rightarrow K^+K^-)/\Gamma(D^0 \rightarrow \pi^+\pi^-) \simeq 2\text{-}5$, can be solved simultaneously. (author).

29475 (UWThPh–1989-40) **Vector mesons and chiral symmetry.** Ecker, G. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1989. 9p. Order Number DE90623710. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

The ambiguities in the off-shell behaviour of spin-1 exchange can be resolved to $O(p^4)$ in the chiral low-energy expansion if the asymptotic behaviour of QCD is properly incorporated. As a consequence, the chiral version of vector (and axial-vector) meson dominance is model independent. Additional high-energy constraints motivated by QCD determine the V,A resonance couplings uniquely. In particular, QCD in its effective chiral realization sucessfully predicts $\Gamma(\rho \rightarrow 2\pi)$. 10 refs. (Author).

29476 (UWThPh–1989-41) **A light Zeldovich-Konopinski-Mahmoud neutrino with a large magnetic moment.** Ecker, G. (European Organization for Nuclear Research, Geneva (Switzerland)); Grimus, W.; Neufeld, H. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. Aug 1989. 7p. (CERN-Th–5485/89). Order Number DE90623690. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

We propose a non-Abelian extension of a Zeldovich-Konopinski-Mahmoud lepton number symmetry which gives rise to a naturally light Dirac neutrino with a magnetic moment of $O(10^{-11}\,\mu_B)$. The neutrino mass appears first at the two-loop level and is well below the experimental upper bound. 13 refs., 3.figs. (Authors).

29477 (UWThPh–1989-43) **On the 'equivalent' potential to the Leutwyler-Voloshin model.** Bertlmann, R.A.; Hofer, P. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1989. 10p. Order Number DE90623738. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

We calculate the wave functions at origin of the 'equivalent' potential to the Leutwyler-Voloshin model and find that they reproduce the model results very well. 13 refs., 2 tabs. (Authors).

29478 (UWThPh–1989-54) **Supersymmetric quantum mechanics.** Grosse, H. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1989. 31p. Order Number DE90623739. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

We summarize recent developments of supersymmetric quantum mechanics. We start from the susy oscillator, mention the factorization schemes and discuss the order of levels of Schroedinger operators as an example. We mention soliton equation and the inverse scattering problem and discuss susy breaking and index problems for Dirac operators. The construction of Lie-supergroups suggests a generalization of the well-known theorems of von Neumann and Wigner to superspace. We mention finally studies of the general structure of susy models. A number of relations between the operator formulation and the stochastic formulation result. 25 refs., 2 tabs. (Author).

29479 (UWThPh–1989-55) **The classical geometry of Bosonic Strings.** Beig, R. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1989. 5p. Order Number DE90623740. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

We discuss a finite-dimensional 'canonical' framework for the bosonic string on an arbitrary curved background. 8 refs., 2 figs. (Author).

29480 (UWThPh–1989-64) **Quark jets, gluon jets and the three-gluon vertex.** Fodor, Z. (Roland Eoetvoes Univ., Budapest (Hungary). Inst. for Theoretical Physics). Vienna Univ. (Austria). Inst. fuer Theoretische Physik. Nov 1989. 20p. Order Number DE90623711. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Using hadronic jets in electron-positron annihilation, we suggest a simple and model-independent method to see the differences between quark and gluon jets. We define and analyse special energy dependent moments of jets and choose those which are the most characteristic to the jet type. The method handles the energy of a jet in an adequate way. We discuss new methods using jet flavor tagging, ordinary flavor tagging of a definite quark jet or discrimination between quark and gluon jets, to test the triple-gluon vertex in electron-positron annihilation. An enriched sample of gluon jets, jets with the smallest energy in four-jet events, as well as a continuous tagging variable are also studied. 21 refs., 6 figs. (Author).

29481 (UWThPh–1989-65) **Vector meson exchange in radiative kaon decays and chiral perturbation theory.** Ecker, G. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik); Pich, A.; Rafael, E. de. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1989. 15p. (FTUV–89-44;CPT–89/PE2325). Order Number DE90623691. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The role of vector meson resonances in radiative K decays is analyzed within the context of chiral perturbation theory. In general, there are big cancellations between strong amplitudes with external weak transitions and direct weak amplitudes, which are usually not considered in naive vector meson dominance estimates. We introduce a 'weak deformation model' inspired by the geometry of the coset space $SU(3)_R \times SU(3)_L/SU(3)_V$ to estimate the direct weak contributions to $K \rightarrow \pi\gamma^*$ and $K \rightarrow \pi\gamma\gamma$. The implications for the decay mode $K_L \rightarrow \pi^0 e^+ e^-$ are discussed. 23 refs., 4 figs., 1 tab. (Authors).

29482 (UWThPh–1990-9) **The status of the electric dipole moment of the neutron.** Grimus, W. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 26 Feb 1990. 21p. Order Number DE90623741. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The electric dipole moment of particles in quantum mechanics and quantum field theory is discussed. Furthermore, calculations of the neutron electric dipole moment in the standard model and several of its low-energy extensions are reviewed. 47 refs., 7 figs. (Author).

29483 **Phenomenology of the CKM matrix.** Nir, Y. (Stanford Linear Accelerator Center, Stanford University, Stanford, CA 94309 (US)). *AIP Conference Proceedings (American Institute of Physics) (USA)*, 196(1): 35-45 (15 Dec 1989). (CONF-8906204–: International symposium on heavy quark physics, Ithaca, NY (USA), 13-17 Jun 1989).

The way in which an exact determination of the CKM matrix elements tests the Standard Model is demonstrated by a two-generation example. The determination of matrix elements from

meson semileptonic decays is explained, with an emphasis on the respective reliability of quark level and meson level calculations. The assumptions invovled in the use of loop processes are described. Finally, the state of the art of our knowledge of the CKM matrix is presented.

29484 Symmetry, topology and helicity in $D_s \to \omega\pi$ and $D_s \to \rho\pi$ decays. Lipkin, H.J. (Department of Nuclear Physics, Weizmann Institute of Science, Rehovot 76100, Israel (IL)—School of Physics and Astronomy, Raymond and Beverly Sackler Faculty of Exact Sciences, Tel Aviv University, Tel Aviv, Israel—High Energy Physics/Physi *AIP Conference Proceedings (American Institute of Physics) (USA)*, 196(1): 72-78 (15 Dec 1989). DOE Contract W-31-109-ENG-38. (CONF-8906204–: International symposium on heavy quark physics, Ithaca, NY (USA), 13-17 Jun 1989).

Diagrams contributing to $D_s \to \omega\pi$ and $D_s \to \rho\pi$ decays are classified by topology as (a) OZI-forbidden or disconnected, (b) OZI-allowed or connected; by helicity as (a) helicity-conserving, (b) with helicity flips on both outgoing quark lines. The $D_s \to \omega\pi$ decay has an exotic final state and is forbidden for all annihilation diagrams which go via an intermediate state containing a single quark-antiquark pair and less than two additional gluons. It is also forbidden for helicity-conserving OZI-allowed diagrams, which are expected to be dominant and are allowed for $D_s \to \rho\pi$ decays.

29485 Non-perturbative QCD in weak decays. Sharpe, S.R. (University of Washington, Seattle, WA 98195 (US)). *AIP Conference Proceedings (American Institute of Physics) (USA)*, 196(1): 59-71 (15 Dec 1989). DOE Contract AS06-88ER40423. (CONF-8906204–: International symposium on heavy quark physics, Ithaca, NY (USA), 13-17 Jun 1989).

The status of nonperturbative calculations of hadronic matrix elements is reviewed, with particular emphasis on lattice results. New results are presented for B_K and for the $K^+ \to \pi^+\pi^0$ decay amplitude.

29486 Wormholes and Peccei-Quinn symmetries. Choi, K. (Department of Physics, Carnegie Mellon University, Pittsburgh, Pennsylvania 15213 (US)); Holman, R. *Physical Review Letters (USA)*, 64(2): 131-134 (8 Jan 1990). DOE Contract AC02-76ER03066.

We show how wormholes and Peccei-Quinn symmetries are in fact complementary in solving the strong *CP* problem. On the one hand, Peccei-Quinn symmetries are shown to provide us with a wormhole parameter that couples only to the QCD anomaly. This then allows us to implement the wormhole solution to the strong *CP* problem constructed previously by the present authors as well as by Preskill, Trivedi, and Wise. On the other hand, wormholes are shown to drive the axion mass to zero or to the wormhole scale, thus avoiding the axion-energy-density crisis in either case.

29487 Scattering theory relevant to the linear transport of particle swarms. Frosali, G. (Virginia Polytechnic Institute and State Univ., Blacksburg (USA)); van der Mee, C.V.M. *Journal of Statistical Physics (USA)*, 56(1-2): 139-148 (Jul 1989).

The long-time behavior of the velocity distribution of a spatially uniform diluted guest population of charged particles moving within a host medium under the influence of a D.C. electric field is studied within the framework of scattering theory. The authors prove the existence of wave and scattering operators for a simplified one-dimensional model of the linearized Boltzmann equation. The theory is applied to the study of the long-term behavior of electrons and the occurrence of traveling waves in runaway processes.

29488 (CEA-CONF–9521) **Superconformal models and the supersymmetric coulomb gas.** Saleur, H. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique. Mar 1988. 7p. (CONF-8803253–: 3. annecy meeting in theoretical physics on conformal field theory and related topics, Annecy (France), 14-16 Mar 1988). Order Number DE90770196. Available from NTIS (US Sales Only), PC A02/MF A01.

The obtention of the supersymmetric 19-vertex model from an inhomogeneous 6-vertex model, is discussed. The 19-vertex model is considered the underlying theory and applied to calculate the partition function of the torus. A similar scheme to that for the critical models obtention, concerning the restriction procedure at special points of the gaussian line (of the 6-vertex model) is used. The critical line, in the supersymmetric model, is described by a free superfield and related to the XY model. The "fused" lattice models are outlined. It is shown that the results can be generalized to the models obtained by SU(2) coset construction.

29489 (CEA-CONF–9522) **Properties of the stress tensor in more than two dimensions.** Cappelli, A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique); Coste, A. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique. Mar 1988. 8p. (CONF-8803253–: 3. annecy meeting in theoretical physics on conformal field theory and related topics, Annecy (France), 14-16 Mar 1988). Order Number DE90770195. Available from NTIS (US Sales Only), PC A02/MF A01.

Some aspects of conformal invariance in more than two dimensions are analysed. In this case conformal (Weyl) transformations of the metric are not realized in general by coordinate transformations. The operator product expansion of the stress tensor is investigated by means of examples in the free bosonic and fermionic theories. The effective action for the general form of the trace anomaly is built in four dimensions and the Wess-Zumino consistency conditions are discussed. This gives the anomalous transformation law of the stress tensor and the relation to the Casimir effect in the geometry $R \times S^3$. The explicit computation of the bosonic partition function provides a check.

29491 (INS–788) **Magnetic properties of three-dimensional Hubbard-sigma model.** Yamamoto, Hisashi; Ichinose, Ikuo; Tatara, Gen; Matsui, Tetsuo. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Nov 1989. 50p. Order Number DE90777711. Available from NTIS (US Sales Only), PC A03/MF A01.

It is broadly viewed that the magnetism may play an important role in the high-T_c superconductivity in the lamellar CuO_2 materials. In this paper, based on a Hubbard-inspired CP^1 or S^2 nonlinear σ model, we give a quantitative study of some magnetic properties in and around the Neel ordered state of three-dimensional quantum antiferromagnets such as La_2CuO_4 with and without small hole doping. Our model is a (3+1) dimensional effective field theory describing the low energy spin dynamics of a three-dimensional Hubbard model with a very weak interlayer coupling. The effect of hole dynamics is taken into account in the leading approximation by substituting the CP^1 coupling with an 'effective' one determined by the concentration and the one-loop correction of hole fermions. A stationary-phase equation for the one-loop effective potential of S^2 model is analyzed numerically. The behavior of Neel temperature, magnetization (long range Neel order), spin correlation length, etc as functions of anisotropic parameter, temperature, hole concentrations, etc are investigated in detail. A phase diagram is also supported by the renormlization group analysis. The results show that our anisotropic field theory model with certain values of parameters could give a reasonably well description of the magnetic properties indicated by some experiments on pure and doped La_2CuO_4. (author).

29492 (INS–795) **Spontaneous compactification and structure of gauge vacua in six-dimensional gauge theory.** Nakamura, A. (Tokyo Metropolitan Univ. (Japan). Dept. of Physics); Shiraishi, K. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Nov 1989. 17p. Order Number DE90777714. Available from NTIS (US Sales Only), PC A03/MF A01.

We consider an SU(2) gauge theory in six-dimensions. We show that there exists non-trivial structure of gauge vacua in compactified background $M^4 \times S^2$. In this circumstances, there can exist a cosmic string, whose solution is recently constructed by the present authors. We consider the stage of the formation of the strings, i.e., the phase transition of the gauge configuration on the sphere in the 'hot' early universe. We find that if SU(2)-doublet fermions are the dominant component of the radiation at high temperatures, the phase transition successively occurs after the spontaneous-compactification transition. Otherwise, non-trivial vacuum with 'monopole' configuration of the SU(2) gauge field never appears globally and strings must be formed at the same time as the extra space is compactified. (author).

29493 (NBI-HE–89-62) **The O(N)-symmetric non-linear σ-model to three leading orders in 1/N.** Flyvbjerg, H.; Varsted, S. Niels Bohr Inst., Copenhagen (Denmark). Dec 1989. 14p. (CONF-8908189–: Workshop on probabilistic methods in quantum field theory and quantum gravity, Cargese (France), 21-27 Aug 1989). Order Number DE90623403. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The two-point function of the O(N)-symmetric non-linear σ-model is expanded in 1/N, keeping terms of three leading orders. The mass gap and the magnetic susceptibility are obtained from the two-point function. They are evaluated on square lattices for N=3 and N=4. The systematic errors of the 1/N-series truncated after the first, second, or third term are found by using recent high precision Monte Carlo results as bench marks. For all three truncations, we find systematic errors which are smaller than the expected magnitude of neglected terms, both for the mass gap and for the susceptibility. This result is uniform in the inverse coupling β, and valid for N as small as 3. We conclude that the 1/N-series approach the exact results as rapidly as one could ever hope for. (orig.).

29494 (RRK–89-23) **Some aspects of quantum groups and supergroups.** Corrigan, E. (Durham Univ. (UK). Dept. of Mathematical Sciences); Fairlie, D.B.; Fletcher, P.; Sasaki, R. Hiroshima Univ., Takehara (Japan). Research Inst. for Theoretical Physics. Jul 1989. 17p. Order Number DE90777884. Available from NTIS (US Sales Only), PC A03/MF A01.

The paper concentrates upon certain algebraic aspects of the quantum inverse scattering theory and develops ideas arising principally from the viewpoint of Manin, who considers a quantum group as effecting linear transformations upon a space whose elements are non-commutative. The conditions for such a mapping to be an endomorphism constitute the quantum group relations. In fact, since this idea underlies the classical transformation groups, it is a very natural, though at first sight unfamiliar, approach to the deformation of classical groups. The idea of Manin is recounted for the simplest example of GLq(2) and develop properties of this quantum group. A natural extension leads to the definition of the dual group GLq(2) whose elements are Grassmannian, and GLq(1/1) which is connected with the quantum extension of the superalgebra SU(1/1), just as GLq(2) is connected with the quantum extension of SU(2). These groups are then displayed in a more familiar way as bilinear relations specified by an R-matrix satisfying the Yang-Baxter equation. The minimal set of relations imposed by the R-matrix relations is shown to be equivalent to those imposed by Manin's construction, and in fact, Manin's construction can be used to infer the structure of the R-matrix for the classical groups. (N.K.).

29495 (RRK–89-26) **Aspects of perturbed conformal field theory, affine Toda field theory and exact S-matrices.** Braden, H.W. (Durham Univ. (UK)); Corrigan, E.; Dorey, P.E.; Sasaki, R. Hiroshima Univ., Takehara (Japan). Research Inst. for Theoretical Physics. Jul 1989. 14p. Order Number DE90777887. Available from NTIS (US Sales Only), PC A03/MF A01.

Zamolodchikov suggests the hypothesis that the perturbed theory is actually an integrable theory of eight massive bosons. Following this development, the aim of the present study is to try to discover what this integrable theory is by conjecturing a candidate, and testing Zamolodchikov's arguments. On the way, a number of interesting facts are discovered concerning affine Toda field theory and two-dimensional factorisable S-matrices. It seems that this by itself warrants further investigation. Thus, in the report, the Zamolodchikov's strategy is outlined first, and then factorisable S-matrices are discussed on the assumption that the interesting theories contain self-conjugate particles only, with distinct masses. In the next section, the report describes a simple field theory which is certainly related to the S-matrix Zamolodchikov describes and which might be used as a framework within which to explore further. In any case, it seems that the connection with Toda theory is by itself interesting and revives interest in work begun many years ago. Finally, other affine Toda theories are also discussed briefly. (N.K.).

29496 (UWThPh–1989-35) **On the classical geometry of bosonic string dynamics.** Beig, R. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1989. 14p. Order Number DE90623404. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

We develop a treatment of bosonic strings on a general curved background in which the volume element and the coordinates of the worldsheet are related in a similar way as canonically conjugate quantities in mechanics. The resultant formalism is a particular variant of the multi-phase space approach to classical field theory put forward by Kijowski, Tulczyjew and others. We study conservation laws within this framework and find that all conserved quantities are related to point symmetries, i.e. isometries of the underlying spacetime. Thus the symmetries of relativistic mechanics coming from Killing-tensors have no analogue here. We furthermore deduce from the present scheme the covariant version of the usual phase space. 14 refs. (Author).

29497 (UWThPh–1989-46) **Covariant virasoro operators.** Embacher, F. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1989. 9p. Order Number DE90623405. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

The concept of 'covariant Virasoro operators' is defined, and some applications to the open bosonic string field theory are given. 17 refs. (Author).

29498 (UWThPh–1989-66) **Renormalizable ultraviolet finite three dimensional gauge model.** Krasnikov, N.V. (Academy of Sciences of the USSR. Moscow (USSR). Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

We construct a renormalizable ultraviolet finite three dimensional gauge model. We show that three dimensional quantum electrodynamics without a kinetic term for the electromagnetic field is renormalizable and ultraviolet finite in the framework of the 1/N expansion. The generalization of our results to the nonabelian case are briefly discussed. 7 refs., 2 figs. (Author).

29499 (UWThPh–1989-67) **Abelization by operator equivalence in string theory.** Embacher, F. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1989. 25p. Order Number DE90623407. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

An operator is presented which transforms the 'true' bosonic open-string BRST charge into the 'abelized' one. The same transformation relates the transverse DDF-operators with the transverse elementary oscillators. This allows a simple realization of the light-cone gauge condition in the convariant Fock-space. Furthermore, some light is shed upon the concept of covariant Virasoro operators. Finally, the functional representation of the abelizing operator is given, and some speculations about string field theory and string interactions are made. 23 refs. (Author).

We set up a geometrical formulation of the canonical quantization of free Klein-Gordon field on a gravitational background. We introduce the notion of the Bogolubov bundle as the principal fiber bundle over the space of all Cauchy surfaces belonging to some fixed foliation of space-time, with the Bogolubov group as the structure group, as a tool in considering local Bogolubov transformations. Sections of the associated complex structure bundle have the meaning of attaching Hilbert spaces to Cauchy surfaces. We single out, as physical, sections defined by the equation of parallel transport on the Bogolubov bundle. The connection is then subjected to a certain nonlinear differential equation. We find a particular solution, which happens to coincide with a formula given by L.Parker for Robertson-Walker space-times. Finally, we adopt the adiabatic hypothesis as the physical input to the formalism and fix in this way a free parameter in the connection. Concluding, we comment on a possible geometrical interpretation of the regularization of stress-energy tensor and on generalizations of the formalism toward quantum gravity. 14 refs. (Author).

29502 **New mean field theories of the Hubbard model.** Krishnamurthy, H.R, (Princeton Univ., Princeton, NJ (US)); Jayaprakash, C.; Wenzel, W.; Sarker, S. pp. 1744 of Proceedings of the international conference on materials and mechanisms of superconductivity. High temperature superconductors II. Part 1-2. Shelton, R.N.; Harrison, W.A.; Phillips, N.E. Elsevier Science Pub. Co., Inc., New York, NY (USA) (1989). Grant DNR8518163. (CONF-890718–: International conference on materials and mechanisms of superconductivity - high-temperature superconductors II, Stanford, CA (USA), 23-28 Jul 1989).

The authors summarize some of the results they have obtained in recent studies of the Hubbard model on the square and triangular lattices. They utilize spin-boson, slave-fermion mean filed theories and the Hartree-Fock mean field theory allowing for xy-SPIRAL spin order.

29503 **Noether's theorem for local gauge transformations.** Karatas, D.L. (High Energy Physics Division, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Kowalski, K.L. *American Journal of Physics (USA),* 58(2): 123-131 (Feb 1990). DOE Contract W-31-109-ENG-38.

The variational methods of classical field theory may be applied to any theory with an action that is invariant under local gauge transformations. What is the significance of the resulting Noether current? This article examines such currents for both Abelian and non-Abelian gauge theories and provides an explanation for their form and limited range of physical significance on a level accessible to those with a basic knowledge of classical field theory. Several of the more subtle aspects encountered in the application of the residual local gauge symmetry found by Becchi, Rouet, Stora, and Tyutin are also considered in detail in a self-contained manner.

29505 (ANL/NDM–114) **Ambiguities in the elastic scattering of 8 MeV neutrons from adjacent nuclei.** Smith, A.B.; Lawson, R.D.; Guenther, P.T. Argonne National Lab., IL (USA). Oct 1989. 45p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE90009518. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Ratios of the cross sections for elastic scattering of 8 MeV neutrons from adjacent nuclei are measured over the angular range $\approx 20° - 160°$ for the target pairs ^{51}V/Cr, ^{59}Co/^{58}Ni, Cu/Zn, ^{89}Y/^{93}Nb, ^{89}Y/Zr, ^{93}Nb/Zr, In/Cd and ^{209}Bi/Pb. The observed ratios vary from unity by as much as a factor of ≈ 2 at some angles for the lighter target pairs. Approximately half the measured ratios are reasonably explained by a simple spherical optical model, including size and isospin contributions. In all cases, the geometry of the real optical–model potential is essentially the same for neighboring nuclei, and the real–potential strengths are consistent with the Lane model. In contrast, it is found that the imaginary potential may be quite different for adjacent nuclei, and the nature of this difference is examined. It is shown that the spin–spin interaction has a negligible effect on the calculation of the elastic–scattering ratios, but that channel coupling, leading to a large reorientation of the target ground state, can be a consideration, particularly in the ^{59}Co/^{58}Ni case. In the $A \approx 50–60$ region the calculated ratios are sensitive to spin–orbit effects, but the exact nature of this interaction must await more definitive polarization measurements. The measured and calculated results suggest that the concept of a conventional "global" or even "regional" optical potential provides no more than a qualitative representation of the physical reality for a number of cases. 48 refs., 14 figs., 3 tabs.

29507 (JAERI-M–90-025) **Proceedings of the 1989 seminar on nuclear data.** Nakajima, Yutaka (ed.) (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Igashira, Masayuki (ed.). Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment. c Feb 1990. 413p. (NEANDC(J)–149/U;INDC(JPN)–136/L;CONF-8911182–: 1989 seminar on nuclear data, Tokai (Japan), 16-17 Nov 1989). Available from Japan Atomic Energy Research Institute, Department of Technical Information, Tokai-mura, Naka-gun, Ibaraki-ken 319-11, Japan.

The 1989 Seminar on Nuclear Data was held at the Tokai Research Establishment of Japan Atomic Energy Research Institute, on November 16 and 17, 1989. This Seminar was organized by the Japanese Nuclear Data Committee (JNDC) and the Nuclear Data Center, JAERI. In an oral session, review and benchmark tests of JENDL-3 were presented, which were followed by a lively discussion. The need of nuclear data other than neutron induced reaction data were also presented. In addition, several topical talks were given. In a poster session, twenty papers on evaluation and measurement were presented and discussed. In these proceedings, thirty-four papers given in the seminar are compiled.

29508 (KEK–89-12) **Proceedings of the workshop on the experiments by polarized proton and electron beams.** Hasegawa, Takeo (Miyazaki Univ. (Japan)); Hiramatsu, Shigenori; Horikawa, Naoaki; Nakanishi, Tsutomu; Tamae, Tadaaki (eds.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Sep 1989. 237p. (CONF-8810498–: Workshop on the experiments by polarized proton and electron beams, Tsukuba (Japan), 27-28 Oct 1988). Order Number DE90777829. Available from NTIS (US Sales Only), PC A11/MF A01.

This issue is the collection of the papers presented at the title meeting. The 21 of the presented papers are indexed individually. (J.P.N.).

29509 (NAC-AR-86-01, pp. 191-204) **Nuclear reactions and structure: Reactions involving neutrons and reactions induced by alpha-particles. .** National Accelerator Centre, Faure (South Africa). 1986. In *Annual report June 1986.* Order Number DE90624865. Available from NTIS (US Sales Only), PC A13/MF A01; OSTI; INIS.

Information on the level structure of nuclei is extended and new and refined information about specific nuclear reaction mechanisms and nuclear interactions is provided. 7 figs., 18 refs.

29510 (ORNL/FTR-3575) **[Supercomputing in nuclear applications]: Foreign trip report, March 12-22, 1990.** Kirk, B.L. Oak Ridge National Lab., TN (USA). 9 Apr 1990. 25p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90009829. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler attended the first international conference on supercomputing in nuclear applications. The traveler presented a paper on parallel processing of the nodal diffusion method. The traveler visited JAERI, NEDAC, Hitachi Works, CRC and CTCC. At JAERI and NEDAC, the traveler made a presentation on RSIC activities. The traveler then proceeded to the Philippines where she visited PNRI, made an RSIC orientation visit and presented the SNA 90 paper and had several discussions with PNRI staff.

29511 (ORNL/FTR-3586) **[Nuclear structure and decay data]: Foreign trip report, March 8, 1990-March 31, 1990.** Martin, M.J. Oak Ridge National Lab., TN (USA). 10 Apr 1990. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90009865. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler participated in the meeting, the main purpose of which was to continue the coordination and development of the international network of centers devoted to the compilation, evaluation, and exchange of mass-chain nuclear structure and decay data. Following the meeting, the traveler spent an extra week in Kuwait, and visited the data centers in Beijing and Shanghai for more detailed discussions on specific problems in data evaluation and presentation.

29512 (ORNL/FTR-3591) **[The 28th meeting of the Nuclear Energy Agency Nuclear Data Committee]: Foreign trip report, March 26, 1990-March 30,,1990.** Perey, F.G. Oak Ridge National Lab., TN (USA). 16 Apr 1990. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90009866. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler attended the 28th meeting of the NEANDC at Harwell, England. Extensive reorganization of the UK Atomic Energy Authority will severely impact the cross-section work at Harwell. International collaboration on nuclear data evaluation is proceeding smoothly. Changes in handling the separated isotopes in DOE's Research Material Collection will have a serious impact on nuclear data measurements of interest to the United States.

29513 (RCNP-P-107) **Proceedings of the workshop on 'cyclotron cascade project'.** Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. 242p. (In Japanese). (CONF-8903211-: Workshop on cyclotron cascade project, Ibaraki (Japan), 13-15 Mar 1989). Order Number DE90777870. Available from NTIS (US Sales Only), PC A11/MF A01.

This issue is the collection of the papers presented at the title meeting. The 29 of the presented papers are indexed individually. (J.P.N.).

29514 (UCRL-50400-Vol.6-Rev.4-Pt.A) **Tables and graphs of photon-interaction cross sections from 10 eV to 100 GeV derived from the LLNL [Lawrence Livermore National Laboratory] Evaluated Photon Data Library (EPDL): Volume 6: Rev. 4: Part A, Z = 1 to 50.** Cullen, D.E.; Chen, M.H.; Hubbell, J.H.; Perkins, S.T.; Plechaty, E.F.; Rathkopf, J.A.; Scofield, J.H. Lawrence Livermore National Lab., CA (USA). 31 Oct 1989. 374p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90010470. Available from NTIS, PC A16/MF A01 - OSTI; GPO Dep.

Energy-dependent evaluated photon interaction cross sections and related parameters are presented for elements H through Fm (Z = 1 – 100). Data are given over the energy range from 10 eV to 100 GeV. Cross sections, average energy deposits, and form factors are presented in tabulated and graphic form. In addition, photoelectric cross sections for each shell and coherent anomalous scattering factors are presented in graphic form. This information is derived from the Livermore Evaluated Photon Data Library (EPDL) as of October 1989. This publication is divided into two parts. Part A, Z = 1 to 50 and Part B, Z = 51 to 100.

29515 (UCRL-50400-Vol.6-Rev.4-Pt.B) **Tables and graphs of photon-interaction cross sections from 10 eV to 100 GeV derived from the LLNL Evaluated Photon Data Library (EPDL): Volume 6, Part B, Z = 51 to 100: Revision 4.** Cullen, D.E.; Chen, M.H.; Hubbell, J.H.; Perkins, S.T.; Plechaty, E.F.; Rathkopf, J.A.; Scofield, J.H. Lawrence Livermore National Lab., CA (USA). 31 Oct 1989. 452p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90010469. Available from NTIS, PC A20/MF A01 - OSTI; GPO Dep.

Energy-dependent evaluated photon interaction cross sections and related parameters are presented for elements H through Fm (Z = 1–100). Data are given over the energy range from 10 eV to 100 GeV. Cross sections, average energy deposits, and form factors are presented in tabulated and graphic form. In addition, photoelectric cross sections for each shell and coherent anomalous scattering factors are presented in graphic form. This information is derived from the Livermore Evaluated Photon Data Library (EPDL) as of October 1989. This publication is divided into two parts: Part A, Z = 1 to 50 and Part B, Z = 51 to 100.

29516 Valency in actinide systems as viewed by neutron scattering. Lander, G.H. (Argonne National Lab., IL (USA)). pp. 44 of American Chemical Society, Division of Nuclear Chemistry and Technology. American Chemical Society, Washington, DC (US) (1986). (CONF-8609360-: Symposium on solid-state actinide chemistry and physics, Anaheim, CA (USA), 7-12 Sep 1986).

Of central importance in studying actinide systems is the question of how many unpaired 5f electrons surround the actinide nucleus, and what is their interaction with other electrons - either the conduction electrons in metals or the d - p orbitals of neighboring anions. The magnetic moment of the neutron interacts directly with those of the unpaired electrons in the solid and thus can, in principle, answer this important question. Two examples will be presented. The first is the ionic compound UCl_4 where, for the first time, their experiments show how the f electrons participate in the bonding. The second is the metallic system PuSb, where the 5f electrons appear localized (Pu^{3+}) but their experiments indicate deviations from localized behavior caused by interaction with the conduction electrons. New experiments on PuTe will be contrasted with those on PuSb. The extension of this work to other covalent actinide systems will be discussed.

Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

It is believed that a good bet for finding the Quark-Gluon Plasma at AGS energies is with the heaviest projectiles on the heaviest target, i.e. Au on Au. One of the likely signatures of the plasma is strangeness enhancement. Al Saulys has shown what it's like to find Δ and K° with Si projectiles. Our Monte Carlo simulations show track densities 4 times higher for Au projectiles. In addition, the Au beam itself produces 30 times more ionization. Thus the

present TPC's will be limited to only a few hundred ions per sec. This paper discusses plans for these experiments and modification to TPC. 9 figs.

29518 (DOE/ER/40415–12) **Magnetic electron scattering.** Peterson, G.A. Massachusetts Univ., Amherst, MA (USA). Dept. of Physics and Astronomy. [1989]. 20p. Sponsored by U.S. DOE Energy Research. We briefly review some of the motivations, early results, and techniques of magnetic elastic and inelastic electron-nucleus scattering. We then discuss recent results, especially those acquired at high momentum transfers. 50 refs., 19 figs.

29519 (GANIL-P–89-16) **Properties of light nuclei very far from beta stability.** Detraz, C. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1989. 20p. (CONF-890826–: International nuclear physics and cosmology conference, Sao Paulo (Brazil), 20-26 Aug 1989). Order Number DE90770334. Available from NTIS (US Sales Only), PC A03/MF A01.

This paper will be devoted to underlying the major developments which occurred in the study of light nuclei far from the valley of stability since the last International Nuclear Physics Conference in Harrogate (1986) where that field of research was already presented (1). A broader review will appear elsewhere (2). Therefore only some highlights are presented and discussed here. Probably the main development of the field in recent years has to do with a change in its aims and methods. The goal is no longer to search for individual hitherto unobserved nuclear species and to report their existence. It has become to study the major nuclear properties such as binding energy, half life, size, decay modes over broad ranges of neighbouring isotopes extending very far from stability in order to put to a test the current nuclear models based essentially on observations of nuclei near the stability line.

29520 Nucleus-nucleus collisions at relativistic energies: The CERN WA80 experiment. . Plasil, P. (Oak Ridge National Lab., TN (USA)); Awes, T.C.; Bakatash, C.; Ferguson, R.L.; Johnson, J.W.; Lee, I.Y.; Obenshain, F.E.; Sorensen, S.P.; Young, G.R.; Albrecht, R. pp. 541 of Proceedings of the 6th Adriatic international conference on nuclear physics: Frontiers of heavy-ion physics. Cindro, N.; Caplar, R.; Greinder, W. World Scientific Pub. Co., Teaneck, NJ (USA) (1987). DOE Contract AC05-84OR21400. (CONF-8706113–: 6. Adriatic international conference on nuclear physics: frontiers of heavy-ion physics, Dubrovnik (Yugoslavia), 15-19 Jun 1987).

QCD lattice calculations predict that, at sufficiently high energy densities, hadronic matter undergoes a transition to a new phase of matter, the quark-gluon plasma, in which quarks and gluons are deconfined over a relatively large volume. It has been suggested that collisions between heavy nuclei at ultrarelativistic energies may produce the energy densities, estimated to be greater than 2-3 GeV/fm^3, necessary for this phase transition to occur. An important goal of the first experiments with ultrarelativistic heavy-ion beams at the SPS accelerator at CERN is to investigate the extent to which this suggestion is correct. The primary experimental quantity used for estimating the energy density is the transverse energy, E_T. The authors present energies measured at zero degrees, together with transverse energy measurements. Estimates of attained energy densities and preliminary transverse momentum distributions of neutral products are also presented.

29521 (KEK–89-15) **Tests for cold fusion in electrochemically deuterized palladium.** Isagawa, S.; Kanda, Y.; Kondo, K.; Miyajima, M.; Sasaki, S.; Suzuki, T.; Yukawa, T. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Oct 1989. 17p. Order Number DE90777759. Available from NTIS (US Sales Only), PC A03/MF A01.

Two recent papers have reported positive detection of nuclear radiation from similar electrochemical cells operating with deuterated water. We have attempted to confirm this cold nuclear fusion by detecting neutrons and tritiums using similar electrolytic cells. A variety of electrochemical cells having palladium cathodes in the forms of tubes and rods, and electrolytes were examined. So far we have observed no statistically significant evidence for neutron emission and generation of tritium, after running for times up to about one month. (author).

29522 (RCNP-P–106, pp. 86-89) **Structure of the $_\Sigma{}^4$He hypernuclear bound state.** Harada, T. (Hokkaido Univ., Sapporo (Japan). Faculty of Science). Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

The structure of $_\Sigma{}^4$He is theoretically investigated on the basis of realistic ΣN interaction. The bound state has spin-parity $J^\pi = 0^+$ and isospin $T \approx 1/2$ (99 %), binding energy $B_{\Sigma^+} = 3.7 \approx 4.6$ MeV and a narrow ΣN → ΛN conversion width of $\Gamma = 4.5 \approx 7.9$ MeV, which are in agreement with experimental data obtained at KEK. The existence of the Σ-bound state with such a narrow width is explained from characteristic properties of the nucleus-Σ potential derived from the microscopic four-body calculation. (author).

29523 (RCNP-P–106, pp. 77-85) **Production and structure of light Σ hypernuclei: Summary of the few body XII invited talk. .** Hayano, R.S. (Tokyo Univ. (Japan). Dept. of Physics). Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

Recent developments on experimental and theoretical studies on light Σ hypernuclei are presented. The ^{4}He(K^-, π^-) experiment by the Tokyo group, aiming at the search for the Σ hypernuclear ground state, has shown the existence of a peak in the Σ bound region. Comparisons of this result with various theoretical expectations are made. (author).

29524 (RCNP-P–106, pp. 45-51) **Equation for the NNN-πNNN system and its application to pd → ^{3}Heπ^0 ($t\pi^+$) reaction.** Ueda, Tamotsu (Osaka Univ., Toyonaka (Japan). Faculty of Engineering Science). Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

A relativistic and unitary theory for the systems of NNN - πNNN in the Δ production energy region is presented. The systems are approximated by the plural three- and two-body systems which couple through multi-channel two-body interactions. A Faddeev-type equation is given in the form of one-variable integral equation in the three dimensions, while equivalent to the four-dimensional covariant form. The equation describes all the reactions among the Nd, ^{3}He(t)π, NNN and Ndπ system in a unified way. An application is made to pd - ^{3}He $\pi^0(t\pi^+)$ reaction with the approximation that the NNΔ system dominates in the intermediate state through the $J^P = 2^+$ isotriplet-dibaryonic two-body interaction. A remarkable finding is that the $J^P = 5/2^+$ amplitude makes an anticlockwise loop in the Argand plot with its magnitude maximum about 30 MeV below the NNΔ threshold, suggesting the existence of a quasi-bound state of the NNΔ system. Furthermore, the origin for a spike structure in the energy dependence of the tensor polarization of deuteron at T_d = 400-600 MeV is explained. (author).

29525 (RCNP-P–106, pp. 39-44) **Deuteron breakup reaction with strong p-n final state interaction.** Okamura, H. (Institute of Physical and Chemical Research, Wako, Saitama (Japan)). Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (CONF-8905289–: Workshop on few-body systems, Ibaraki

(Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

The deuteron breakup reaction has been studied at E_d = 56 and 70 MeV in a kinematically complete coincidence measurement of p-n pairs with small relative energies. The singlet deuterons ($d_{s=0}$) have been successfully selected. It is demonstrated that the ($d,d_{s=0}$) reaction is a useful tool for the study of the inelastic excitation of the spin- and isospin-flip mode. The elastic breakup reaction at θ = 0deg has been also studied. A conspicuous double-peaked structure in the p-n relative momentum and a characteristic dependence of the cross section on targets are observed. These features are analyzed in terms of the pure Coulomb breakup of the deuteron. (author).

29526 (RCNP-P–106, pp. 34-38) **0 deg measurement of ^{3}He(p,n)^{3}LI and ^{2}H(d,d*)d reactions.** Okihana, Akira (Kyoto Univ. of Education (Japan)). Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

The ^{3}He(p,n)^{3}Li and ^{2}H(d,d*)d* reactions have been measured at 0deg. The spectrum of neutrons from the ^{3}He(p,n)^{3}Li reaction at 65 MeV at 0deg was reproduced without 3p resonances or states. The spectrum of pn coupled to the singlet state from the ^{2}H(d,d*)d* reaction at 56 MeV at 0deg was reproduced with the Watson-Migdal theory. (author).

29527 (RCNP-P–106, pp. 12-14) **Energy dependence of the ^{2}H(d,dp)n reaction.** Hayashi, T. (Kyoto Univ. (Japan). Dept. of Physics); Fukunaga, K.; Kakigi, S.; Ohsawa, T.; Okihana, A.; Sekioka, T.; Nakamura-Yokota, H.; Murayama, T. Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

Energy dependence of the cross section and the vector analyzing power A_y for the ^{2}H(d,dp)n reaction were measured at E_d = 54.6, 56.7, 59.6, 61.7 MeV in the QFS conditions. The experimental data were compared with the PWIA calculation. The cross section changes very slowly with energy, and shows no sharp dip that G.Hrehuss et.al. reported. The analyzing power A_y also shows no structure. (author).

29528 (RCNP-P–106, pp. 10-11) **Analyzing power for the ^{3}He(d,dd)^{1}H reaction at 59.5 MeV.** Sekioka, T. (Himeji Inst. of Tech., Hyogo (Japan)); Fukunaga, K.; Kakigi, S.; Ohsawa, T.; Hayashi, T.; Okihana, A. Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

The ^{3}He(d,dd)^{1}H reaction was investigated with a vector polarized deuteron beam at 59.5 MeV in the quasifree scattering (QFS) conditions. The analyzing powers were obtained at nine coincidence angle pairs. They are compared with the analyzing powers for the dd elastic scattering with deuteron beam energy of 56 MeV. The maximum value of A_y is reduced considerably compared with that for the dd elastic scattering. A calculation of the A_y for the QFS bumps taking account of multiple scattering effect is in progress. (author).

29529 (RCNP-P–106, pp. 6-9) **Three-body breakup contribution to the spectral function of ^{4}He.** Morita, H. (Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics); Suzuki, T. Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

We calculate the three-body break up contribution to the spectral function of ^{4}He within the plane-wave approximation. The realistic spectral function has pronounced high- momentum and excitation energy components caused by the NN correlation. (author).

29530 (RCNP-P–106, pp. 149-152) **Analyzing powers in p+d scattering at low energy.** Sagara, K. (Kyushu Univ., Fukuoka (Japan). Dept. of Physics); Nakamura, H.; Nakashima, M.; Maeda, K.; Izumi, M.; Yamaoka, T.; Nakashima, T. Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

Analyzing powers of H(d,d) scattering at 14 MeV were measured at very forward angles up to 3deg (lab). The tensor analyzing powers reflect apparent Coulomb-nuclear interference effect at around 5deg (lab). The data are compared with Faddeev calculations with/without the Coulomb force. (author).

(FR)); Detraz, C.; Anne, R.; Bricault, P.; Dufour, J.P.; Bazin, D.; Fleury, A.; Hubert, F.; Pravikoff, M.S.; Jacmart, J.C. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1989. 9p. Order Number DE90773449. Available from NTIS (US Sales Only), PC A02/MF A01.

Beta-delayed charged-particle radioactivity has been observed for the ^{40}Ti and ^{39}Ti isotopes produced by reactions of a 65 MeV/u ^{58}Ni beam on a natural Ni target. The measured half-lives for both nuclei are in agreement with theoretical predictions for β-decay. Partial decay scheme for ^{40}Ti is proposed. No evidence was found for direct two-proton radioactivity of ^{39}Ti..

Helicity dependence in the neutron radiative capture and the elastic scattering cross sections of ^{139}La was examined by a simultaneous measurement of capture γ-ray intensity and neutron transmission. Significant helicity dependence was only in a p-wave resonance of ^{139}La at E_n=0.734 eV. The longitudinal asymmetry in the p-wave resonance was $A_{L,\gamma}$=(9.5±0.3)% and $A_{L,n}$=(9.7±0.5)% for the capture γ-ray and the neutron transmission measurements, respectively. A possibility to measure T-odd correlations on polarized neutron transmission through a polarized lanthanum target is discussed. (author).

29536 **Angular momentum effects in subbarrier fusion.** Halbert, M.L. (Oak Ridge National Lab., TN (USA)); Beene, J.R.; Hensley, D.C.; Honkanen, K.; Semkow, T.M.; Abenante, V.; Sarantites, D.G.; Li, Z. pp. 541 of Proceedings of the 6th Adriatic international conference on nuclear physics: Frontiers of heavy-ion physics. Cindro, N.; Caplar, R.; Greinder, W. World Scientific Pub. Co., Teaneck, NJ (USA) (1987). DOE Contract AC05-84OR21400. (CONF-8706113–: 6. Adriatic international conference on nuclear physics: frontiers of heavy-ion physics, Dubrovnik (Yugoslavia), 15-19 Jun 1987).

The authors discuss angular-momentum distributions σ_I for the compound nucleus ^{164}Yb deduced from measurements of γ-ray multiplicity for all significant evaporation residues from fusion of ^{64}Ni and ^{100}Mo and ^{16}O + ^{148}Sm. At the lowest bombarding energies the σ_I extend to higher I values than do predictions that include coupling of the principal inelastic channels, even if the coupling strengths are increased to match the experimental excitation function. Likewise, σ_I from an energy-dependent real potential fitted to the excitation function fails to reproduce the experimental σ_I distribution. No effects attributed to superdeformation were observed.

29537 (UJF–01/89) **Reduced probabilities of gamma transitions in even-even erbium isotopes (A=158-170) and isotones with N=94 (A=158-164) (as well).** Adam, J.; Honusek, M.; Wagner, V. Ceskoslovenska Akademie Ved, Rez (Czechoslovakia). Ustav Jaderne Fyziky. Jan 1989. 71p. Order Number DE90623952. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

The reduced probabilities of the E2 intraband and interband transitions in even-even erbium isotopes (A=158 to 170) and N=94 isotones (A=158 to 164) are analyzed using perturbation theory. The mixing wave functions and different values of intrinsic quadrupole moments were taken into account of ground, beta- and gamma-vibrational states. (author). 18 figs., 16 tabs., 52 refs.

29538 (BNL–44431) **AGS silicon gold collisions measured in the E-810 TPC [Time Projection Chamber].** Bonner, B.E.; Buchanan, J.A.; Chiou, C.N.; Clement, J.M.; Corcoran, M.D.; Kruk, J.W.; Miettinen, H.E.; Mutchler, G.S.; Nessi, M.; Nessi-Tedaldi, F. Brookhaven National Lab., Upton, NY (USA); Rice Univ., Houston, TX (USA); City Coll., New York, NY (USA); Johns Hopkins Univ., Baltimore, MD (USA). 26 Mar 1990. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016;AS05-81ER40032;AC02-83ER40107;AC02- (CONF-900331–2: Heavy ion physics at the alternating gradient synchrotron, Upton, NY (USA), 5-7 Mar 1990). Order Number DE90010015. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The tracking detector of AGS Experiment 810 is a three-piece Time Projection Chamber (TPC) intended to measure all charged tracks in the forward hemisphere of the nucleon-nucleon center of mass system, i.e. forward of an angle of about 20 degrees in the lab. Each module of the TPC contains twelve rows of short anode wires which give 3-D space points on each track, but no dE/dx information useable for particle identification. The TPC was operated in a beam of silicon ions at the end of June 1989 and this talk reports the results of analysis of the data taken with a thin gold target in that run. We have gathered a similar amount of data from thin copper and silicon targets, the analysis of which is in a less advanced state. The results of our investigation of the neutral strange particle decays appear in a separate contribution by Al Saulys. This paper presents the current state of the analysis of the charged tracks from the silicon gold collisions. 1 ref., 15 figs.

29539 (CONF-900450–2) **Superdeformation in the mercury nuclei.** Janssens, R.V.F. (Argonne National Lab., IL (USA)); Carpenter, M.P.; Fernandez, P.B.; Moore, E.F.; Ahmad, I.; Khoo, T.L.; Wolfs, F.L.H.; Drigert, M.W.; Ye, D.; Beard, K.B. Argonne National Lab., IL (USA). [1990]. 15p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract W-31109-ENG-38;AC07-76ID01570;FG02-87ER40346. Grant PHY88-02279. From Nuclear structure in the '90's; Oak Ridge, TN (USA); 23-27 Apr 1990. Order Number DE90010103. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We shall first summarize the present experimental situation concerning ^{192}Hg, the nucleus regarded as the analog of ^{152}Dy for this superdeformation (SD) region in that gaps are calculated to occur at large deformation for Z = 80 and N = 112. Proton and neutron excitations out of the ^{192}Hg core will then be reviewed with particular emphasis on ^{191}Hg and ^{193}Tl. The presentation will conclude with a brief discussion on limits of the SD region for neutron deficient Hg nuclei. 26 refs., 10 figs.

29540 (CONF-900295–3) **Fission at sub-barrier energies.** Back, B.B. (Argonne National Lab., IL (USA)); Betts, R.R.; Fernandez, P.; Glagola, B.G.; Happ, T.; Henderson, D.; Ikezoe, H.; Benet, P. Argonne National Lab., IL (USA). [1990]. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 6. workshop on nuclear dynamics; Jackson Hole, WY (USA); 17-24 Feb 1990. Order Number DE90010127. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Fission fragment angular distributions have been measured for the reaction ^{16}O + ^{232}Th at beam energies of 78.2, 82.2, 86.6, and

100.6 MeV. In this experiment, it was possible to determine the relative contributions of fragments from both the fission decay of the ^{248}Cf compound nuclei, formed in complete fusion reactions between the target and the projectile, and the sequential fission decay of nuclei in the Th region, populated in inelastic scattering and/or transfer reactions on the Th target. This separation was made possible by using flight-time measurements. It was found that fragments from fission of ^{248}Cf showed a somewhat smaller angular anisotropy as compared with earlier measurements in which the sequential fission component was not excluded. The anisotropies found in the present experiment are, however, even with this correction, somewhat larger than expected on the basis of theoretical models. 11 refs., 4 figs.

29541 (CONF-900608–2) **Analysis of the ^{239}Pu neutron cross sections from 300 to 2000 eV.** Derrien, H.; de Saussure, G. Oak Ridge National Lab., TN (USA). [1990]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From American Nuclear Society annual meeting; Nashville, TN (USA); 10-15 Jun 1990. Order Number DE90004303. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A recent high-resolution measurement of the neutron fission cross section of ^{239}Pu has allowed the extension from 1 to 2 keV of a previously reported resonance analysis of the neutron cross sections, and an improvement of the previous analysis in the range 0.3 to 1 keV. This report analyzes this region. 8 refs., 1 fig., 2 tabs.

29542 (CONF-900608–6) **On the ENDF/B unresolved resonance region formalism representation for ^{239}Pu.** Ono, S. (Centro Tecnico Aerospacial, Sao Jose dos Campos, SP (Brazil). Inst. de Estudos Avancados); Paviotti-Corcuera, R.; Perez, R.B.; de Saussure, G. Oak Ridge National Lab., TN (USA). 1990. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From American Nuclear Society annual meeting; Nashville, TN (USA); 10-15 Jun 1990. Order Number DE90005675. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The purpose of this work is to compare the performance of several cross-section evaluation files for the calculation of average cross sections in the unresolved resonance region and to test the validity of the ENDF/B methodology for the calculation of self-shielding factors in this region. The ^{239}Pu neutron cross sections were used for this comparison since a multilevel R-matrix analysis was available, which extended the resolved resonance region from its present ENDF/B limit of 300 eV up to 1 keV. 12 refs., 2 tabs.

29543 (INS–787) **On the stopped antiproton production of heavy hypernuclei.** Bando, H.; Zofka, J. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Nov 1989. 15p. Order Number DE90777710. Available from NTIS (US Sales Only), PC A03/MF A01.

Contributions of various processes in stopped p-bar annihilation populating bound hypernuclear states are estimated for Pb and U targets and compared with experiment. The lower limit is estimated for the effect of unusual ($B \geq 1$) annihilations. (author).

29544 (ANL-PHY–89/1) **Proceedings of a symposium on the occasion of the 40th anniversary of the nuclear shell model: Part 2, Poster papers.** Lee, T.S.H.; Wiringa, R.B. (eds.). Argonne National Lab., IL (USA). Physics Div. Mar 1990. 113p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-890583–Pt.2: Symposium on the occasion of the 40th anniversary of the nuclear shell model, Argonne, IL (USA), 25-27 May 1989). Order Number DE90010252. Available from NTIS, PC A06/MF A01; OSTI; INIS; GPO Dep.

This report contains papers on the following topics: excitation of 1p-1h stretched states with the (p,n) reaction as a test of shell-model calculations; on Z=64 shell closure and some high spin states of ^{149}Gd and ^{159}Ho; saturating interactions in ^{4}He with density dependence; are short-range correlations visible in very large-basis shell-model calculations?; recent and future applications of the shell model in the continuum; shell model truncation schemes for rotational nuclei; the particle-hole interaction and high-spin states near A-16; magnetic moment of doubly closed shell +1 nucleon nucleus ^{41}Sc(I^{π}=7/2^{-}); the new magic nucleus ^{96}Zr; comparing several boson mappings with the shell model; high spin band structures in ^{165}Lu; optical potential with two-nucleon correlations; generalized valley approximation applied to a schematic model of the monopole excitation; pair approximation in the nuclear shell model; and many-particle, many-hole deformed states.

29545 (BNL-NUREG–44453) **Secondary interactions in HIJET.** Longacre, R.S. Brookhaven National Lab., Upton, NY (USA). 2 Apr 1990. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016;AC02-83ER40107;AS05-81ER40032;AC02- (CONF-900331–5: Heavy ion physics at the alternating gradient synchrotron, Upton, NY (USA), 5-7 Mar 1990). Order Number DE90010122. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This talk deals with the investigation of secondary interactions in proton-nucleus and nucleus-nucleus collisions using the Monte Carlo event generator HIJET.

29546 **The nuclear shell model: Proceedings.** Lee, T.-S.H.; Wiringa, R.B. 321p. Elsevier Science Publishers B.V., Amsterdam, The Netherlands (1990). Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Symposium on the occasion of the 40th anniversary of the nuclear shell model; Argonne, IL (USA); 25-27 May 1989.

A symposium was held May 25–27, 1989, at Argonne National Laboratory to celebrate the fortieth anniversary of the nuclear shell model. The focus of the meeting was not on past glory, however, but on the current status and future directions of the shell model. The topics covered included modern large-basis set calculations, developments in interacting boson models, applications to collective modes and high-spin states, connections to mean-field theories, and the latest experimental evidence on shell structure. Considerable emphasis was placed on the role the shell model can play in studies of nucleon structure and quantum chromodynamics in the nucleus.

29547 (CONF-900181–3) **A comparison of the velocity spectra obtained with the Boltzmann and Boltzmann-Langevin equations.** Stryjewski, J. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Ayik, S.; Belkacem, M.; Suraud, E. Tennessee Technological Univ., Cookeville, TN (USA). [1990]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-89ER40530. From 18. international workshop of the gross properties of nuclei and nuclear excitations; Hirschegg (Austria); 15-20 Jan 1990. Order Number DE90009316. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The velocity spectra of Intermediate Mass Fragments produced in the reaction ^{12}C + ^{12}C at 30, 40, 50, and 60 MeV/A are studied using both the Boltzmann and the Boltzmann-Langevin approaches. We find that the velocity distribution obtained with the stochastic Boltzmann-Langevin equation is significantly different from that obtained with the standard (non-stochastic) Boltzmann equation. 7 refs., 1 fig.

29548 (CONF-9002112–1) **Kaon production in Landau-Vlasov calculations.** Belkacem, M. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Stryjewski, J.; Suraud, E.; Ayik, S. Tennessee Technological Univ., Cookeville, TN (USA). [1990]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-89ER40530. From 28. winter meeting on nuclear dynamics; Bormio (Italy); Feb 1990. Order Number DE90009315. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The cross section of the Kaon production for the ^{12}C + ^{12}C and ^{93}Nb + ^{93}Nb systems at very "low" bombarding energy ($\leq$500 MeV/A) is estimated using both the Boltzmann and the Boltzmann-Langevin approaches. We find very small cross sections at these energies, but those obtained using the stochastic Boltzmann equation are substantially larger than those obtained with the standard Boltzmann equation. 15 refs., 3 figs.

29549 (KFK–4655) **Applications of the maximum entropy principle in nuclear physics.** Froehner, F.H. Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Inst. fuer Neutronenphysik

und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Projekt Schneller Brueter. Jan 1990. 38p. (CONF-8909300–: 9. summer school on nuclear physics, neutron physics and nuclear energy conference, Varna (Bulgaria), 28 Sep - 7 oct 1989). Order Number DE90780367. Available from NTIS (US Sales Only), PC A03/MF A01.

cSoon after the advent of information theory the principle of maximum entropy was recognized as furnishing the missing rationale for the familiar rules of classical thermodynamics. More recently it has also been applied successfully in nuclear physics. As an elementary example we derive a physically meaningful macroscopic description of the spectrum of neutrons emitted in nuclear fission, and compare the well known result with accurate data on ^{252}Cf. A second example, derivation of an expression for resonance-averaged cross sections for nuclear reactions like scattering or fission, is less trivial. Entropy maximization, constrained by given transmission coefficients, yields probability distributions for the R- and S-matrix elements, from which average cross sections can be calculated. If constrained only by the range of the spectrum of compound-nuclear levels it produces the Gaussian Orthogonal Ensemble (GOE) of Hamiltonian matrices that again yields expressions for average cross sections. Both avenues give practically the same numbers in spite of the quite different cross section formulae. These results were employed in a new model-aided evaluation of the ^{238}U neutron cross sections in the unresolved resonance region. (orig.).

29551 (RCNP-P–106, pp. 29-33) **Total cross section of n+^{6}Li and n+^{7}Li scattering by three-cluster formulation.** Fujiwara, Yoshikazu (Kyoto Univ. (Japan). Faculty of Science); Tang, Y.C. Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

The scattering and reaction cross sections for n+^{7}Li system are examined with a multiconfiguration and multichannel resonating-group calculation utilizing a three-cluster formulation for α+3N+N system. The incorporated channels are n+^{7}Li, n+^{7}Li*, t+^{5}He, and ^{4}H+α, where ^{7}Li* is the excited state of ^{7}Li having t+α structure with the relative orbital angular momentum l=3. The obtained energy spectrum of ^{8}Li has a very nice agreement with the R-matrix predictions by Knox and Lane. The total elastic cross section for n+^{7}Li scattering is overestimated by about 15-20 %. For the total reaction cross section, the present calculation yields only 50-60 % of the experimental value, which is a consistent conclusion with the previous result of the seven-nucleon system in terms of the similar model. (author).

29552 (RCNP-P–106, pp. 26-28) **Calculation of cluster expansion method, 2.** Sakai, W. (Akashi Technical Coll., Hyogo (Japan)). Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan). 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

A Cluster method calculation is applied to determine the energy and radius of the ^{6}Li Nuclei. One Boson Exchange force and α cluster model are employed. The effect of scalar meson, vector meson and pseudo scalar meson are separately calculated. The tendency of these effect are reasonable. (author).

29553 (RCNP-P–106, pp. 20-25) **Analysis of 0^{+}-states on ^{16}O nucleus with the 4α-model Faddeev-Yakubovsky equation.** Oryu, S. (Science Univ. of Tokyo, Noda, Chiba (Japan). Faculty of Science and Technology); Kamada, H.; Sekiguchi, H.; Nishino, T.; Sekine, H. Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

The numerical calculation of the 4-body Faddeev-Yakubovsky equation was done in the case of 4α-model of ^{16}O, and the low-lying 0^{+}-states including the ground state are investigated. The rank-one α-α separable potential which was given by Kukulin-Neudatchin, is adopted for 0^{+}, 2^{+}, and 4^{+} states. We adopted 0^{+}, 2^{+} and 4^{+} substates for ^{12}C which are so called [3+1] sub-states, and also 0^{+}, 2^{+} and 4^{+} states for ^{8}Be-^{8}Be or [2+2] sub-states are chosen. Then, 30 state-channels all together are coupled. We obtained five energy levels below the 3α threshold energy -17.9 MeV of the ^{12}C ground state calculated. However, three of them (-30.1MeV, -39.6MeV, and -61.6MeV) may be physical states, but two levels left (-82.4MeV and -194.5MeV) are spurious states. In order to compare them with the experimental spectra, one should take into account not only the Coulomb energy but also effects of the three-cluster force. (author).

29554 (RCNP-P–106, pp. 15-19) **3-α model and 3-body force.** Kamada, Hiroyuki (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study); Oryu, Shinsho. Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

The 3-alpha model of ^{12}C-nucleus is investigated by using the 3-body Faddeev equation with the Pauli-correct separable alpha-alpha potential. In the low-lying energy spectra of ^{12}C-nucleus, there are characteristic states which contain the shell-model-like states, cluster-states and negative parity states. We obtain aculate energy levels of cluster-states, but shell-model-like-states is over bound. By introducing several types of 3-body forces, we study the role of 3-body force in the composite particle system like ^{12}C-nucleus. It is found that the symmetric or 2-Gaussian type is better to reproduce the energy level structure than the others. (author).

29555 (RCNP-P–106, pp. 153-157) **Deuteron breakup reaction by low energy neutron.** Takemiya, Toshinori (Kumamoto Univ. (Japan). Faculty of Science). Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

A general formulus for the deuteron breakup reaction by low energy neutron is derived from the Faddeev equation. The formulus is applied to the kinematically incomplete deuteron breakup reaction. (author).

29556 (RCNP-P–106, pp. 136-139) **Phenomenological separable N-^{12}C interaction with correct energy-dependence in positive and negative energy regions.** Miyagawa, Kazuya (Okayama Coll. of Science (Japan)); Koike, Yasuro. 29557 (RCNP-P–106, pp. 144-148) **Three-nucleon continuum state and three-body force.** Ishikawa, Souichi (Tohoku Univ., Sendai (Japan). Dept. of Physics). Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

We solved the three-nucleon Faddeev integral equations in the coordinate space for some realistic N-N potentials above the three-body breakup threshold. Some numerical tests are given. (author).

29558 (RCNP-P–106, pp. 131-135) **Three-body Lippmann-Schwinger equation without rearrangement channels.** Sawada, Tatsuro (Nara Women's Univ. (Japan). Dept. of Physics). Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

In the theory of three-body scattering, the triad of Lippmann-Schwinger (LS) equation introduced by Gloeckle (the so-called LS triad) is believed to be equivalent to the Faddeev equation (Conjecture A). It is also believed that, in the absence of rearrangement channels, the LS triad degrades to a single three-body LS equation so that the latter is sufficient to yield a unique solution (Conjecture B). Underlying Conjecture B is Conjecture A. In this note, we investigate what is involed in these conjectures and whether and how they can be correct. (author).

29559 (RCNP-P–106, pp. 128-130) **Validity of continuum discretized coupled channels.** Yahiro, Masanobu (Shimonoseki Univ. of Fisheries, Yamaguchi (Japan)). Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

The widely-used continuum discretized coupled channels (CDCC) method is discussed as an approximate calculations of three body systems. The validity of the discretization and the truncation of the breakup states is discussed. A set of coupled equations is presented for converting a CDCC solution into a full solution of the original Schroedinger equation. (author).

29560 (RCNP-P–106, pp. 122-127) **Coupled-rearrangement-channel variational method for three-nucleon bound states.** Kameyama, H. (Kyushu Univ., Fukuoka (Japan). Dept. of Physics); Kamimura, M. Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Nov 1989. (In Japanese). (CONF-8905289–: Workshop on few-body systems, Ibaraki (Japan), 22-24 May 1989). In *Proceedings of the workshop on few-body systems.* Order Number DE90760000. Available from NTIS (US Sales Only), PC A08/MF A01.

The coupled-rearrangement-channel variational method with Gaussian-basis functions is applied to the ^{3}H and ^{3}He ground states. The binding energies, probabilities of the S, S′, P and D states and the S- and D-wave asymptotic normalization constants for ^{3}H and ^{3}He are calculated with a realistic two-nucleon potential, Argonne V14 potential, and the Tucson-Melbourne three-nucleon potential. For ^{3}He, the Coulomb potential is included nonperturbatively. These values are compared with the results of the Faddeev calculations. Convergence of the present results is seen at a much smaller number of the three-body channels than in the Faddeev calculations. This is because the interaction is truncated in the angular momentum space in the Faddeev calculations but the full interaction is taken in the present method. (author).

29561 Structures of exotic nuclei. Hamilton, J.H. pp. 541 of Proceedings of the 6th Adriatic international conference on nuclear physics: Frontiers of heavy-ion physics. Cindro, N.; Caplar, R.; Greinder, W. World Scientific Pub. Co., Teaneck, NJ (USA) (1987). (CONF-8706113–: 6. Adriatic international conference on nuclear physics: frontiers of heavy-ion physics, Dubrovnik (Yugoslavia), 15-19 Jun 1987).

Discoveries of many different types of nuclear shape coexistence are being found at both low and high excitation energies throughout the periodic table, as documented in recent reviews. Many new types of shape coexistence have been observed at low excitation energies, for examples bands on more than four different overlapping and coexisting shapes are observed in ^{185}Au, and competing triaxial and prolate shapes in ^{71}Se and ^{176}Pt. Discrete states in super-deformed bands with deformations $\beta_2 \sim 0.4$-0.6, coexisting with other shapes, have been seen to high spin up to $60\hbar$ in ^{152}Dy, ^{132}Ce and ^{135}Nd. Super-deformed nuclei with N and Z both around 38 and around Z = 38, N $\geq$ 60. These data led to the discovery of new shell gaps and magic numbers of 38 for N and Z and 60 for N but now for deformed shapes. Marked differences in structure are observed at spins of 6 to 20 in nuclei in this region, which differ by only two protons; for example, ^{68}Ge and ^{70}Se. The differences are thought to be related to the competing shell gaps in these nuclei.

29562 Close collisions between light nuclei-orbiting and fusion. Shapira, D. (Oak Ridge National Lab., TN (USA)); Shivakumar, B.; Harmon, B.A.; Ayik, S. pp. 541 of Proceedings of the 6th Adriatic international conference on nuclear physics: Frontiers of heavy-ion physics. Cindro, N.; Caplar, R.; Greinder, W. World Scientific Pub. Co., Teaneck, NJ (USA) (1987). DOE Contract AC05-84OR21400. (CONF-8706113–: 6. Adriatic international conference on nuclear physics: frontiers of heavy-ion physics, Dubrovnik (Yugoslavia), 15-19 Jun 1987).

According to the authors, studies of close collisions in which nuclear matter, energy and angular momentum undergo substantial rearrangement should enhance understanding of the nuclear many-body system and of the behavior of bulk nuclear matter. The results and models based on studies of such processes between heavy nuclei bear this out. The lighter nuclei, on which this study focuses, are unique in several respects: their binding energy per nucleon increases with mass number - therefore the amalgamation of two such nuclei produces a composite at high excitation energies even for relatively low bombarding energies, and their fission into two complex fragments is also severely restricted. In these light systems the Coulomb and centrifugal barriers attain comparable magnitude and both barriers can influence the outcome of the collision. The study of collisions between light nuclei affords the possibility of full identification of all the detected reaction products, with a modest effort. The authors present their data which demonstrates that in collisions the two nuclei first form a rotating dinuclear complex (DNC) which can breakup into two complex fragments (orbiting) or evolve into a compound nucleus.

29563 The influence of the neutron-proton interaction on nuclei near and at double subshell closure. Meyer, R.A. (Lawrence Livermore National Lab., CA (USA)). pp. 541 of Proceedings of the 6th Adriatic international conference on nuclear physics: Frontiers of heavy-ion physics. Cindro, N.; Caplar, R.; Greinder, W. World Scientific Pub. Co., Teaneck, NJ (USA) (1987). DOE Contract W-7405-ENG-48. (CONF-8706113–: 6. Adriatic international conference on nuclear physics: frontiers of heavy-ion physics, Dubrovnik (Yugoslavia), 15-19 Jun 1987).

Present studies of ^{96} Zr with a double subshell closure are reviewed along with studies of neighboring nuclei. Combination of information from these studies are shown to lead to several important new features. Among these are: dual subshell closure in $_{40}$ Zr nuclei at N = 56, backbending of the 1g-intruder band as low as spin 6, evidence for double octupole phonon states, dramatic alteration of the low energy structure of the N-59 isotones, and the need for a stronger neutron-proton interaction strength used in collective models. Extension of these properties are shown to account for anomolous states in $^{102-8}$ Pd and ^{146} Gd.

29564 Study of nuclei far from stability with exotic nuclear beams. Takahashi, N. (College of General Education, Osaka Univ., Toyonaka-Osaka, 560 (JP)). pp. 541 of Proceedings of the 6th Adriatic international conference on nuclear physics: Frontiers of heavy-ion physics. Cindro, N.; Caplar, R.; Greinder, W. World Scientific Pub. Co., Teaneck, NJ (USA) (1987). (CONF-8706113–: 6. Adriatic international conference on nuclear physics: frontiers of heavy-ion physics, Dubrovnik (Yugoslavia), 15-19 Jun 1987).

A variety of stable and unstable nuclei has been created as fragments in high-energy heavy-ion collisions. Determination of their nuclear radii from the measurement of interaction cross sections reveals appreciable differences between the root-mean-square radii ^{6}He-^{6}Li, ^{8}He-^{8}Li and ^{9}Li-^{9}Be and, on the other hand, the same radii of the pair of mirror nuclei ^{7}Li-^{7}Be. The large radii of the neutron-rich isotopes ^{6}He and ^{8}He suggest the existence of a thick neutron crust. Another use is described of exotic nuclear beams for detection of snowball in superfluid helium. The authors observed a new possibility of studying nuclear moments of exotic nuclei, using the freezing-out of their polarization in a form of snowballs. ^{6}He and ^{8}He and many other beta-active nuclei also serve for study of the transport phenomena related to impurity ions and thus basic interactions in condensed matter.

29565 Origin of complex fragments in intermediate energy heavy ion reactions. Moretto, L.G. (Lawrence Livermore National Lab., CA (USA)). pp. 541 of Proceedings of the 6th Adriatic international conference on nuclear physics: Frontiers of heavy-ion physics. Cindro, N.; Caplar, R.; Greinder, W. World Scientific Pub. Co., Teaneck, NJ (USA) (1987). DOE Contract AC03-76SF00098. (CONF-8706113–: 6. Adriatic international conference on nuclear physics: frontiers of heavy-ion physics, Dubrovnik (Yugoslavia), 15-19 Jun 1987).

Complex fragments observed in intermediate energy heavy ion reactions are shown to arise from the binary decay of a compound nucleus formed in a complete or incomplete fusion process.

29566 Mechanism of dissipation in heavy-ion reactions. Nix, J.R. (Los Alamos National Lab., NM (USA)); Sierk, A.J. pp. 541 of Proceedings of the 6th Adriatic international conference on nuclear physics: Frontiers of heavy-ion physics. Cindro, N.; Caplar, R.; Greinder, W. World Scientific Pub. Co., Teaneck, NJ (USA) (1987). (CONF-8706113–: 6. Adriatic international conference on nuclear physics: frontiers of heavy-ion physics, Dubrovnik (Yugoslavia), 15-19 Jun 1987).

The authors discuss a surface-plus-window mechanism for the conversion of nuclear collective energy into internal degrees of freedom at intermediate excitation energies. This novel dissipation mechanism, which results from the long mean free path of nucleons inside a nucleus, involves interactions of either one or two nucleons with the moving nuclear surface and also, for dumbbell-like shapes encountered in heavy-ion reactions and fission, the transfer of nucleons through the window separating the two portions of the system. To illustrate the effect of surface-plus-window heavy-ion reactions, the authors present dynamical calculations for values of the dissipation strength corresponding to 27% and 100% of the Swiatecki wall-formula value, as well as for no dissipation. In addition to dynamical thresholds for compound-nucleus formation in heavy-ion reactions, their new picture describes such other phenomena as experimental mean fission-fragment kinetic energies for the fission of nuclei throughout the periodic system, enhancement in neutron emission prior to fission, short scission-to-scission times on sequential ternary fission, widths of mass and charge distributions in deep-inelastic heavy-ion reactions, and widths of isoscalar giant quadrupole and giant octupole resonances.

29567 Energy separation of the doublet of intrinsic states at the ground state of ^{229}Th. Reich, C.W. (Idaho National Engineering Laboratory, EG&G Idaho, Incorporated, Idaho Falls, Idaho 83415 (US)); Helmer, R.G. *Physical Review Letters (USA)*, 64(3): 271-273 (15 Jan 1990). DOE Contract AC07-76ID01570.

It has been known from some time that the intrinsic state labeled by the asymptotic quantum numbers (3/2)$^{+}$[631] lies quite close (<0.1 keV) to the (5/2)$^{+}$[633] ground state of ^{229}Th. Using the energies of selected γ rays emitted following the α decay of ^{233}U, we have obtained a value of 1±4 eV for the energy separation of these two intrinsic states.

29568 (CONF-900608–8) **Fision product evaluations for ENDF/B-VI.** Wright, R.Q. Oak Ridge National Lab., TN (USA). [1990]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From American Nuclear Society annual meeting; Nashville, TN (USA); 10-15 Jun 1990. Order Number DE90006562. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Most of the ENDF/B-V fission-product evaluations were completed during the time period 1974–1980, and some of these were based on very limited experimental data. For short-lived fission products, there is still very little experimental data available because of the difficulty of obtaining these measurements. However, since 1980 a considerable amount of new experimental data have become available for stable and long-lived fission products. By utilizing the new data, significant improvements are now possible for some fission-product evaluations. The purpose of this paper is to report on 16 ENDF/B-VI evaluations that have been done at Oak Ridge National Laboratory (ORNL). The primary emphasis in this work has been placed on the resolved resonance region, but for some nuclides, new experimental data were also used to improve the evaluations for energies above the resolved resonance range.

29569 (INP–1345/AP) **"Ottawa Sand", "Royer Dolomite" and "Dunite Sand" as reference samples for the thermal neutron absorption cross-section.** Czubek, J.A.; Drozdowicz, K.; Gabanska, B.; Igielski, A.; Krynicka-Drozdowicz, E. Institute of Nuclear Physics, Cracow (Poland). Oct 1986. 44p. Order Number DE90623767. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The absorption cross-section measurements performed for the thermal neutrons on the three samples supplied by the International Atomic Energy Agency are reported. The absorption cross-section was measured using a method developed at the Institute of Nuclear Physics in Cracow (Poland). The method consists in the irradiation by a pulsed fast neutron beam of the system containing the investigated sample surrounded by an outer moderator. The decay constant of the thermal flux in the system is measured as a function of the thickness of the moderator. The absorption cross-section of the sample is obtained from combining the experimental results and the theoretical calculation. Few independent assays were performed for each sample. The average values of the mass absorption cross-section in 10^{-3} cm^{2}/g are: 2.45 ± 0.23 for the Ottawa Sand, 2.71 ± 0.42 and 1.93 ± 0.28 for the Royer Dolomite, and 3.72 ± 0.22 for the Dunite Sand (at the 95% confidence level). The paper contains individual results of the mass and linear absorption cross-sections and densities of the rocks for each assay. Some experimental details and intermediate results in consecutive assays are also included. 25 refs., 6 figs., 36 tabs. (author).

29570 (LA-UR–90-97-Rev.) **An analysis of the finite-differenced, even-parity discrete-ordinates equations in slab geometry.** Miller, W.F. Jr. Los Alamos National Lab., NM (USA). 31 Jan 1990. 6p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-900608–9-Rev.: American Nuclear Society annual meeting, Nashville, TN (USA), 10-15 Jun 1990). Order Number DE90006479. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Considerable effort has been expended in recent years in finding improved spatial differencing schemes for the neutron and radiation transport equations. Standard criteria used to select a candidate scheme are its order of spatial convergence for small mesh size and its positivity in the sense that positive solutions emerge from positive input data. More recently, it has become clear that truly robust schemes must behave well in diffusing regions and must be compatible with an effective iteration acceleration method. Recently, Morel and Larsen reported their work on a promising new method called the multiple balance method that has virtually all the desirable characteristics. Here we study a different approach to the problem by considering discrete-ordinates approximations to the even-parity transport equations. We analyze three spatial difference approaches: diamond differencing, cell-edge differencing, and cell-center differencing. For the case of isotropic scattering and sources, the latter two approaches are shown to be strictly positive, to be second-order accurate, to be compatible with derived diffusion synthetic acceleration methods, and to possess the necessary diffusion limits. Unlike previous work with the even-parity equation, we do not use finite elements or variational principles. 5 refs., 1 tab.

6550 Medical Physics

29571 (CONF-900679–1) **An improved technique for reading C-39 track etch neutron dosimeters.** Koch, P.N.; Sygitowicz, L.S. Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (USA). 1989. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-89NV10630. From 1990 Health Physics Society meeting; Anaheim, CA (USA); 24-28 Jun 1990. Order Number DE90003944. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A significantly improved technique for reading CR-39 track etch neutron dosimetry foils has been developed at the Health Physics Laboratory of Reynolds Electrical & Engineering Co., Inc., at the Nevada Test Site. This new technique, using reflected light for illumination, can be used to discriminate against most surface defects and improves the accuracy and precision of track etch foil analysis. 9 figs.

29572 (SAAS-Mitt–88-02) **Standard operational radiation protection instructions in applying radiographic equipment 2. edit.** Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic). 1988. 23p. (In German). Order Number DE90624694. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

According to article 16(3) of the Ordinance on the Implementation of Atomic Safety and Radiation Protection of 11 October 1984, operational radiation protection instructions have to be worked out for each type of nuclear energy application. Based on the valid legal provisions of the GDR and on experience and knowledge gained in practice, the most important operational instructions and procedures for the operation of radiographic equipment were compiled. The example should enable the management to make the instructions directly applicable and, if necessary, to modify or supplement them.

29573 A logical framework for radiation protection standards for the public. Alexander, R.E. pp. 355 of Population exposure from the nuclear fuel cycle. Proceeding. Alpen, E.L.; Chester, R.O.; Fisher, D.R. Gordon and Breach Science Publishers S.A., New York, NY (US) (1988). (CONF-8709104–: ANS/ORNL topical conference on population exposure from the nuclear fuel cycle, Oak Ridge, TN (USA), 14-18 Sep 1987).

In the past the protection of the public from radiation has been provided by various Federal and State government agencies in a relatively uncoordinated manner. The EPA, NRC, DOE, DOD, DOT, State agencies and others have established and enforced standards applicable within their mandated jurisdictions. The amount of attention that has been given in the adoption of these standards to the possibility that people could be exposed to multiple sources is considered by some to be inadequate. There has been a tendency to develop specific standards, well below 500 millirems per year, on the basis of cost-benefit analysis that consider only the source under study. Logic would seem to dictate that an acceptable level of collective risk would be established for public exposure to ionizing radiation susceptible to governmental controls, and that an appropriate fraction of this risk would then allocated to each contributing source. Nothing of this nature has happened yet, but the problem of exposure to multiple sources is receiving more attention. In consideration of the above problems, a Federal interagency committee has been formed under the lead of the EPA to prepare new Federal guidance for radiation protection of the public. Several meetings of this committe have been held, and discussions have indicated the need for a logical framework within which the committee's deliberations can proceed in a systematic manner. The balance of this paper is devoted to a framework of this nature that has been presented to the committee and is now under consideration.

29574 Experience with the application of radiation protection standards: A driving force. Selby, J.M. (Pacific Northwest Lab., Richland, WA (USA)); Swinth, K.L.; Vallario, E.J. pp. 355 of Population exposure from the nuclear fuel cycle. Proceeding. Alpen, E.L.; Chester, R.O.; Fisher, D.R. Gordon and Breach Science Publishers S.A., New York, NY (US) (1988). DOE Contract AC06-76RL01830. (CONF-8709104–: ANS/ORNL topical conference on population exposure from the nuclear fuel cycle, Oak Ridge, TN (USA), 14-18 Sep 1987).

The purposes of this paper are: (1) to identify the driving forces for the development of new standards within the radiation protection areas; (2) to characterize the process of developing such guidance; (3) to discuss problems with the application of guidance; and (4) to discuss experience in applying recommendations and standards to radiation protection. Efforts to improve performance in health physics measurements, including methods to determine the feasibility and applicability of standards are also described in paper.

29575 (CONF-900466–8) **Mechanical properties of carbon-implanted niobium.** Zinkle, S.J. (Oak Ridge National Lab., TN (USA)); Huang, J.S. Oak Ridge National Lab., TN (USA). [1990]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Spring meeting of the Materials Research Society; San Francisco, CA (USA); 16-21 Apr 1990. Order Number DE90009864. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Polycrystalline niobium specimens were implanted with either 200 keV carbon ions or a combination of 50, 100, and 200 keV carbon ions to peak concentrations of 0.6 to 50 at. %. Microindentation techniques were used to measure the hardness and elastic modulus of the implanted layer. Both the hardness (H) and modulus (E) showed dramatic increases due to the carbon implantation. The measured peak hardness and modulus following uniform implantation with 16 at. % C were 15× and 3× that of niobium, respectively, which is comparable to the literature values for NbC. The peak hardness and modulus for the implanted specimens were observed at an indent depth of ~40 nm, which is about one-eighth of the depth of the implanted carbon layer. The decrease in the indentation mechanical properties at deeper indent depths is due to the interaction of long-ranging strain fields underneath the indenter with the niobium substrate. 17 refs., 6 figs.

29576 (CONF-900684–2) **A weak formulation for phase-change problems with bulk movement due to unequal densities.** Alexiades, V. (Tennessee Univ., Knoxville, TN (USA). Dept. of Mathematics); Drake, J.B. Oak Ridge National Lab., TN (USA). [1990]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 5. international colloquium on free boundary problems: theory and applications; Montreal (Canada); 13-22 Jun 1990. Order Number DE90009398. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

When the densities of solid and liquid are different, a change of phase induces a volume change, forcing movement of the bulk phases. Conservation of total energy across the interface leads to a modified Stefan Condition, which contains a term cubic in the interfacial speed. We present a weak formulation for the conservation of mass, momentum and energy and study numerically a 1-phase, 1-dimensional example. 6 refs., 3 figs.

29577 (KEK–89-2, pp. 36-39) **Analysis of electron-stimulated desorption of H^+ from W(100) based on measured time of flight.** Ikeda, Etsuro (Gakushuin Univ., Tokyo (Japan). Faculty of Science); Suzuki, Toshiyuki; Arakawa, Ichiro. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). May 1989. (In Japanese). (CONF-8903187–: 7. meeting on ultra high vacuum techniques for accelerators and storage rings, Tsukuba (Japan), 27-28 Mar 1989). In *Proceedings of the 7th meeting on ultra high vacuum techniques for accelerators and storage rings.* Order Number DE90741445. Available from NTIS (US Sales Only), PC A11/MF A01.

When a solid is irradiated with electron beams, atoms and molecules are deported from its surface through a electronic stimulation process. This process is called electron-stimulated desorption. The authors have been engaged in research aimed at investigating the mechanism of this process for hydrogen atoms desorbed from a tungsten crystal surface in an effort to develop a method for analysis of hydrogen atoms adsorbed on a solid surface. In particular, the present study focuses on quantitative

analysis and state analysis of hydrogen atoms adsorbed on a surface on the basis of measurements of the energy, directional distribution and yield of hydrogen atoms desorbed by electronic stimulation. H^+ ions desorbed by electron simulation is detected by the flight time method, and a discussion is made of the angular distribution and dependence of the desorption yield on the temperature of the substrate. Results show that H^+ signals decreases with increasing substrate temperature. A slight number of H^+ ions is found to be desorbed by electron simulation even at 673K. The number of desorbed ions is largest in the direction perpendicular to the surface. The desorption energy does not largely depend on the angle. (N.K.).

29578 (NAC-AR-86-01, pp. 229-238) **Solid state and materials research: Solid state interactions in thin-film structures.** National Accelerator Centre, Faure (South Africa). 1986. In *Annual report June 1986.* Order Number DE90624865. Available from NTIS (US Sales Only), PC A13/MF A01; OSTI; INIS.

Thin-film systems which are of importance to the microelectronics industry are discussed. Basic aspects of silicon process technology, such as metallisation, oxidation, and doping, are being investigated. Ion-beams from the Van de Graaff accelerator are used for characterisation, while radioactive tracers provide information about interaction mechanisms. Extensive use is also made of electron microscopy to determine the microstructure of the materials being studied. 6 figs., 5 refs.

29579 (NAC-AR-86-01, pp. 239-243) **Solid state and materials research: Laser irradiation of solids.** National Accelerator Centre, Faure (South Africa). 1986. In *Annual report June 1986.* Order Number DE90624865. Available from NTIS (US Sales Only), PC A13/MF A01; OSTI; INIS.

A high-powered, pulsed (30 ns) ruby laser is used to modify the surface and subsurface regions of materials by rapid melting and quenching (greater than 10^9 degrees C/sec). Heat-flow calculations and modelling are used to determine temperature profiles in the irradiated materials, from which melt depths, recrystallisation velocities and quench rates are determined. The research also includes laser annealing of ion-implanted damage, laser-assisted doping of semiconductors and the formation of glassy materials. 3 figs., 1 tab.

29581 (SAND-89-2918C) **Molecular dynamics simulations of short-range force systems on 1024-node hypercubes.** Plimpton, S.J. Sandia National Labs., Albuquerque, NM (USA). [1990]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9004159-3: 5. distributed memory computing conference, Charleston, SC (USA), 9-12 Apr 1990). Order Number DE90009833. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Two parallel algorithms for classical molecular dynamics are presented. The first assigns each processor to a subset of particles; the second assigns each to a fixed region of 3d space. The algorithms are implemented on 1024-node hypercubes for problems characterized by short-range forces, diffusion (so that each particle's neighbors change in time), and problem size ranging from 250 to 10000 particles. Timings for the algorithms on the 1024-node NCUBE/ten and the newer NCUBE 2 hypercubes are given. The latter is found to be competitive with a CRAY-XMP, running an optimized serial algorithm. For smaller problems the NCUBE 2 and CRAY-XMP are roughly the same; for larger ones the NCUBE 2 (with 1024 nodes) is up to twice as fast. Parallel efficiencies of the algorithms and communication parameters for the two hypercubes are also examined. 8 refs., 2 figs., 1 tab.

29582 (UCRL-CR-103294) **Transient effects in Brillouin gain spectroscopy in solids.** Fairs, G.W. (SRI International, Menlo Park, CA (USA)); Jusinski, L.E.; Dyer, M.J.; Bischel, W.K.; Hickman, A.P. Lawrence Livermore National Lab., CA (USA); SRI International, Menlo Park, CA (USA). 7 Dec 1989. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90009476. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Transient effects on Brillouin gain spectroscopy in solids are examined. A method for accurate measurements of Brillouin peak gain coefficients and linewidths valid in the transient regime is described. Detailed measurements in crystals are presented. 1 refs., 2 figs.

29583 (UCRL-CR-103297) **Brillouin gain spectroscopy in glasses and crystals.** Faris, G.W. (SRI International, Menlo Park, CA (USA). Molecular Physics Lab.). Lawrence Livermore National Lab., CA (USA); SRI International, Menlo Park, CA (USA). Molecular Physics Lab. Dec 1989. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90009536. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Gain spectroscopy is a well established technique for the study of nonlinear scattering phenomena. Several capabilities of gain spectroscopy make the technique very powerful for frequency domain measurements of scattering processes. The use of gain spectroscopy is illustrated by the application of the technique to Brillouin measurements in solids. 21 refs., 2 figs.

29584 Nonequilibrium interface kinetics during rapid solidification. Aziz, M.J. (Harvard Univ., Cambridge, MA (USA). Div. of Applied Sciences). pp. 462 of Science and technology of rapidly quenched alloys. Tenhover, M.; Johnson, W.L.; Tanner, L.E. Materials Research Society, Pittsburgh, PA (USA) (1987). (CONF-861207--: Materials Research Society fall meeting, Boston, MA (USA), 1-5 Dec 1986).

The deviations form local equilibrium at a rapidly moving solid-liquid interface are well documented. The fraction of solute atoms in the liquid that joins the crystal during rapid solidification approaches unity and the interface temperature drops. Experimental and theoretical work on impurity incorporation and interfacial undercooling is reviewed. Past and future experiments to test the theories are discussed.

29585 Ion beam deposition of calcium hydroxyapatite. Barthell, B.L. (Los Alamos National Laboratory, Materials Science and Technology Div., Los Alamos, NM (US)); Archuleta, T.A.; Kossowsky, R. pp. 806 of Biomedical materials and devices. Hanker, J.S.; Giammara, B. L. Materials Research Society, Pittsburgh, PA (USA) (1989). (CONF-8711102--: Symposium on biomedical materials and devices, Boston, MA (USA), 30 Nov - 4 dec 1987).

Calcium hydroxyapatite has been sputtered on glass and Ti-6Al-4V substrates using a 1.5 kV argon ion beam. The films have been examined by X- ray diffraction analysis, energy dispersive spectroscopy, scanning electron microscopy, and adhesion testing. Results of this experimentation are presented.

29586 Spectral function of a hole in a Hubbard antiferromagnet. Trugman, S.A. (Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545 (US)). *Physical Review, B: Condensed Matter (USA),* 41(1): 892-895 (1 Jan 1990).

The Green's function $G(\mathbf{k},\omega)$ is calculated for a hole in a Hubbard antiferromagnet by a new nonperturbative, variational method for an infinite square lattice. The quasiparticle and excited-state wave functions show that the substantial structure in the "incoherent" spectrum is related to string states for large U. The strength of the quasiparticle pole and the anisotropic effective mass are obtained as a function of (U/t). The quasiparticle lifetime is infinite for most $\mathbf{k}$.

29587 Iterative approaches to electronic structure with augmented bases. Fernando, G.W. (Department of Physics, Brookhaven National Laboratory, Upton, New York 11973-6000 (US)). *Physical Review, B: Condensed Matter (USA),* 41(2): 903-906 (15 Jan 1990). DOE Contract AC02-76CH00016.

Combining (local) density-functional theory with molecular dynamics provides a first-principles method of studying melting, disorder, and other complex phenomena. However, there are various technical questions that have to be dealt with before such realistic attempts can be made with accurate electronic-structure calculations that use augmented bases. Here we discuss certain technical aspects of speeding up the electronic-structure codes to allow combined calculations of molecular dynamics. We present an iterative scheme to handle the generalized eigenvalue problem, discuss some aspects of these calculations where improvements are needed, and also show the equivalence of the implementations of the Cholesky decomposition and the Gram-Schmidt orthonormalization.

29588 Disorder, screening, and quantum Hall oscillations. Esfarjani, K. (Department of Physics and Astronomy—University of Delaware, Newark, Delaware 19716 (USA)); Glyde, H.R.; Sayakanit, V. *Physical Review, B: Condensed Matter (USA)*, 41(2): 1042-1053 (15 Jan 1990). DOE Contract FG02-84ER45082.

The density of states (DOS) of electrons in two-dimensional (2D) quantum wells and the broadening of Landau levels (LL's) is evaluated. The electrons are assumed to interact with screened, charged impurities located at random in the material. The random location of the impurities leads to a disordered environment seen by the electrons. The screening of the impurities by the 2D electron gas is evaluated in a simple Thomas-Fermi model which depends on the DOS at the Fermi surface, $n(E_F)$. The DOS and screening are evaluated iteratively at each magnetic field value. We find that the self-consistent evaluation of the DOS and screening leads to broadening of the LL's and $n(E_F)$ that oscillates with B. The oscillating LL widths and $n(E_F)$ are compared with the data of Heitmann *et al.*, Englert *et al.*, Wang *et al.*, and Smith *et al.* and reproduce all the observed values quite well. The chief adjustable parameter is the impurity concentration.

29589 Generalized embedded-atom format for semiconductors. Carlsson, A.E. (Department of Physics, Washington University, St. Louis, Missouri 63130-4899 (USA)); Fedders, P.A.; Myles, C.W. *Physical Review, B: Condensed Matter (USA)*, 41(2): 1247-1250 (15 Jan 1990). DOE Contract FG02-84ER45130.

A new type of total-energy functional for semiconductors is proposed, using a form based on an approximate quantum-mecahnical analysis. Two new types of terms are included: pair terms giving a matrix description of an atom's local environment, and cluster terms describing the ring topology. The scheme reproduces both the covalent and metallic behavior of semiconductor materials in the appropriate limits. A parametrized form of the scheme is applied to Si.

29590 Method of producing non-agglomerating submicron size particles. Bourne, R.S.; Eichman, C.C.; Welbon, W.W. To Dept. of Energy, Washington, DC. USA Patent 4872905/A/. 10 Oct 1989. Filed date 11 May 1988. USA Patent Application 7-192,555. Int. Cl. C23C 15/00. 8p.

This paper describes how submicron size particles are produced by using a sputtering process to deposit particles into a liquid. The liquid is processed to recover the particles therefrom, and the particles have sizes in the range of twenty to two hundred Angstroms. Either metallic or non-metallic particles can be produced, and the metallic particles can be used in metallic inks.

29591 (CONF-8810423–1) **Hyperfine interactions associated with iron substituted superconducting oxides.** Ellis, D.E. (Argonne National Lab., IL (USA)); Dunlap, B.D.; Saitovitch, E.B.; Azevedo, I.S.; Scorzelli, R.B.; Kimball, C.W. Argonne National Lab., IL (USA). Jun 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Latin American conference on the applications of the Moessbauer Effect; Rio de Janeiro (Brazil); 31 Oct - 4 nov 1988. Order Number DE90010411. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Theoretical and experimental Moessbauer spectroscopy studies have been made concerning charge and spin densities and magnetic hyperfine fields (H_{hf}) in iron-substituted superconducting oxides. Calculations were carried out in the self-consistent-field embedded cluster model using local density theory (SCF-Xα) with a variational atomic orbital basis. Spectral densities and changes in charge and spin density were monitored around neighboring Cu sites, as well as Fe impurity site, and $La_2Cu_{1-x}Fe_xO_4$ and $YBa_2Cu_{3-x}Fe_xO_{7-y}$ compounds. Moessbauer isomer shifts (IS), quadrupole splittings (QS) and H_{hf} are obtained by fitting multiline models to the observed spectra and are compared with SCF-Xα results for specific lattice sites. The influence of oxygen vacancies and partial oxygen disorder is modelled and compared with the experimental data on variable oxygen content and disorder. 10 refs., 3 tabs.

29592 Single- vs. multi-orbital theories of the cuprate superconductors: Exact results on finite lattices. Schuttler, H.B. (Center for Simulation Physics, Univ. of Georgia, Athens, GA (US)); Chen, C.X.; Fedro, A.J. pp. 1744 of Proceedings of the international conference on materials and mechanisms of superconductivity. High temperature superconductors II. Part 1-2. Shelton, R.N.; Harrison, W.A.; Phillips, N.E. Elsevier Science Pub. Co., Inc., New York, NY (USA) (1989). DOE Contract W-31-109-ENG-38. Grant DMR-8913878. (CONF-890718–: International conference on materials and mechanisms of superconductivity - high-temperature superconductors II, Stanford, CA (USA), 23-28 Jul 1989).

The authors present a comparative exact diagonalization study of single- and three-orbital Hubbard models for cuprate superconductors in their respective strong-coupling limits. For the simplest case of the three-orbital model, their results indicate a close quantitative correspondence with the single-orbital model, both in the groundstate properties and in the low-energy excitation spectra.

29593 The phonon-plasmon mechanism of high T_c. Kresin, V.Z. (Lawrence Berkeley Lab., Berkeley CA (US)); Morawitz, H. pp. 1744 of Proceedings of the international conference on materials and mechanisms of superconductivity. High temperature superconductors II. Part 1-2. Shelton, R.N.; Harrison, W.A.; Phillips, N.E. Elsevier Science Pub. Co., Inc., New York, NY (USA) (1989). Contract N-00014-86-F0015. (CONF-890718–: International conference on materials and mechanisms of superconductivity - high-temperature superconductors II, Stanford, CA (USA), 23-28 Jul 1989).

New results describing further developments of the phonon-plasmon mechanism of high T_c, proposed earlier by the authors, are discussed. According to their approach, high T_c in the oxides is due to the coexistence of strong electron-phonon coupling and the plasmon mechanism connected with the formation of the unusual low-lying acoustic plasmon branches of these layered systems. It is shown that the importance of the phonon-plasmon mechanism (PPM) is connected with uniquely small values of E_F and v_F. For the lattice dynamics they consider phonon anharmonicity and the effect of hybridization of acoustic and optical branches. In addition, the existence of double well potentials for certain modes is discussed. Both effects lead to strong electron-phonon coupling. They also comment on the isotope effect. The non-monotonic dependence of T_c on the carrier concentration is explained with their model. A method based on the special feature of electron loss spectroscopy is proposed, namely its temperature dependence, which allows the determination of the presence of the low frequency plasmon branch.

29594 Electron-phonon interactions in copper-oxides. Kim, J.H. (The James Franck Institute, The Univ. of Chicago, Chicago, Illinois (US)); Levin, K.; Wentzcovitch, R.; Auerbach, A. pp. 1744 of Proceedings of the international conference on materials and mechanisms of superconductivity. High temperature superconductors II. Part 1-2. Shelton, R.N.; Harrison, W.A.; Phillips, N.E. Elsevier Science Pub. Co., Inc., New York, NY (USA) (1989). (CONF-890718–: International conference on materials and mechanisms of superconductivity - high-temperature superconductors II, Stanford, CA (USA), 23-28 Jul 1989).

The authors calculate electron-phonon coupling constants for the copper oxide planes using a renormalized band structure as well as a diagrammatic 1/N approach. The effects of infinitely strong

Coulomb repulsion lead to a dramatic reduction in the coupling. Phononic, polaronic and some charge transfer descriptions of the superconductivity seem unlikely in view of these results.

29595 A virial theorem and the method of simulated annealing in the Ginzburg-Landau theory. Doria, M.M. (Instituto de Fisica, Univ. de Sao Paulo, C.P. 20516, San Paulo, SP 01498 (BR)); Gubernatis, J.E.; Rainer, D. pp. 1744 of Proceedings of the international conference on materials and mechanisms of superconductivity. High temperature superconductors II. Part 1-2. Shelton, R.N.; Harrison, W.A.; Phillips, N.E. Elsevier Science Pub. Co., Inc., New York, NY (USA) (1989). (CONF-890718--: International conference on materials and mechanisms of superconductivity - high-temperature superconductors II, Stanford, CA (USA), 23-28 Jul 1989).

The method of simulated annealing is used to solve the Ginzburg-Landau equations numerically. The authors also derived a viral theorem for the Ginzburg-Landau theory which establishes a direct relation between the magnetic induction, the external magnetic field and the average kinetic and field energies. The theorem is extended to the presence of inhomogeneities as well. The magnetic properties of superconductors type II are obtained by means of this simulated annealing method and the viral theorem.

29596 Anisotropy in magnetic properties of high-T_c materials. Kogan, V.G. (Iowa State Univ., Ames Lab, Ames, IA (US)). pp. 1744 of Proceedings of the international conference on materials and mechanisms of superconductivity. High temperature superconductors II. Part 1-2. Shelton, R.N.; Harrison, W.A.; Phillips, N.E. Elsevier Science Pub. Co., Inc., New York, NY (USA) (1989). (CONF-890718--: International conference on materials and mechanisms of superconductivity - high-temperature superconductors II, Stanford, CA (USA), 23-28 Jul 1989).

A brief review is given on recent results concerning equilibrium flux-line lattices, the field distribution within a cell of vortex lattices, the transverse magnetization and the anisotropy related torque. Current carrying properties of boundaries between misaligned anisotropic superconductors are discussed.

29597 High-resolution-angle resolved photoemission studies of high temperature superconductors. Olson, C.G. (Ames Lab, Iowa State Univ., Ames, IA (US)); Liu, R.; Lynch, D.W.; Veal, B.W.; Chang, Y.C.; Jiang, P.Z.; Liu, J.Z.; Paulikas, A.P.; List, R.S. pp. 1744 of Proceedings of the international conference on materials and mechanisms of superconductivity. High temperature superconductors II. Part 1-2. Shelton, R.N.; Harrison, W.A.; Phillips, N.E. Elsevier Science Pub. Co., Inc., New York, NY (USA) (1989). DOE Contract W-7405-ENG-82. Grant N00014-89-J-1837. (CONF-890718--: International conference on materials and mechanisms of superconductivity - high-temperature superconductors II, Stanford, CA (USA), 23-28 Jul 1989).

This paper presents recent photoemission studies of Y 123 and Bi 2212 performed with high energy and angular resolution. They provide detailed information on the nature of the states near the Fermi level. Measurements of the superconducting gap, band dispersion, and the density of states near the Fermi level in the normal state all support a Fermi liquid description of these materials.

I show that two spin rotators 180° apart may be desirable for the repetitive Stern-Gerlach effect. I also calculate the effect of depolarization resonance on the repetitive Stern-Gerlach effect. It is shown that to first order in resonance strength, we can avoid the imperfection resonance if the energy of the beam is at $G\gamma = n + 1/2$. The time available for accumulating the Stern-Gerlach kick is then limited by the intrinsic resonance. 5 refs., 1 fig.

The nonlinear boundary integral equations that arise in research of nonlinear magnetostatic problems are investigated in combined formulation on an unbounded domain. Approximations of the derived operator equations are studied based on the Galerkin method. The investigated boundary operators are strongly monotone, Lipschitz-continuous, potential and have a symmetrical Gateaux derivative. The error estimates of the Galerkin's approximation in Sobolev spaces of fractional powers are obtained using the above-mentioned properties of the operators, too. The problem has been studied on surfaces in two and three-dimensional spaces. We answer also some questions on convergence connected with the discretized systems of equations. 21 refs.

29601 (N-90-16401) **Triangle based TVD schemes for hyperbolic conservation laws. Final report.** Durlofsky, L.J.; Osher, S.; Engquist, B. National Aeronautics and Space Administration, Hampton, VA (USA). Inst. for Computer Applications in Science and Engineering. Jan 1990. 31p. (NASA-CR-181984;NAS-1.26:181984;ICASE-90-10). Available from NTIS, PC A03/MF A01.

A triangle based total variation diminishing (TVD) scheme for the numerical approximation of hyperbolic conservation laws in two space dimensions is constructed. The novelty of the scheme lies in the nature of the preprocessing of the cell averaged data, which is accomplished via a nearest neighbor linear interpolation followed by a slope limiting procedures. Two such limiting procedures are suggested. The resulting method is considerably more simple than other triangle based non-oscillatory approximations which, like this scheme, approximate the flux up to second order accuracy. Numerical results for linear advection and Burgers' equation are presented.

As a 'by-product' of the Connes-Narnhofer-Thirring theory of dynamical entropy for (originally non-Abelian) nuclear C^*-algebras, the well-known variational principle for topological entropy is eqivalently reformulated in purly algebraically defined terms for (separable) Abelian C^*-algebras. This 'algebraic variational principle' should not only nicely illustrate the 'feed-back' of methods developed for quantum dynamical systems to the classical theory, but it could also be proved directly by 'algebraic' methods and could thus further simplify the original proof of the variational principle (at least 'in principle'). 23 refs. (Author).

29608 (UWThPh–1989-56) **Lightlike contractions.** Aichelburg, P.C. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1989. 8p. Order Number DE90623388. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

The technique of lightlike contractions in flat and curved space is described. The method consists in boosting a classical field configuration to the velocity of light by an appropriate generalized Lorentz transformation. Within this framework the gravitational field of a massless neutral particle is a meaningful concept. For electrically charged particles, however, the field equations seem to prevent an analogous procedure. We thus conjecture that general relativity forbids the existence of charged point particles moving with the velocity of light. 6 refs. (Author).

Andre Martin is the master of the Schroedinger equation. Where others may do with cheap approximations he would not buy anything but a conclusive result proved by hard analysis. In recent years he applied his skill to meson spectroscopy where one deals with confining potentials. As a birthday present we will offer him a charged medium which gives such a potential purely in the framework of electrodynamics. We realize that this is just a toy and not the mechanism realized in nature. There it is supposed to emerge from QCD where also nonlinear and quantum effects are important. But our model may provide a formal basis to the heuristic discussions one finds in textbooks [1,2]. 6 refs. (Author).

29612 (UWThPh–1989-75) **On the local behaviour of nodes of solutions of Schroedinger equations in dimensions $\geq$ 3.** Hoffmann-Ostenhof, M. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik); Hoffmann-Ostenhof, T. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1989. 17p. Order Number DE90623382. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The behaviour of local solutions of the Schroedinger equation in the neighbourhood of a zero is investigated. 14 refs.

29613 (UWThPh–1990-1) **Perturbations of supersymmetric systems in quantum mechanics.** Baumgartner, B. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 30 Jan 1990. 15p. Order Number DE90623390. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The methods of supersymmetry are extended to the factorization method. The degeneracy of levels in factorizable systems is broken under perturbations. With the methods of supersymmetry it is possible to state laws on the order of these perturbed energy levels. One proof of a confirmation of these laws has a more algebraic touch and works for first order perturbation theory. The proof of the laws beyond perturbation theory is hard, more of an analytic spirit and exploits convexity properties of the potentials. The convexity properties serve also for an intuitive argument. An important application is the law on the ordering of energy levels in atoms. 8 refs. (Author).

29614 (UWThPh–1990-5) **Gauge fixing by choosing a metric in the BRST phase space.** Hueffel, H. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 6 Feb 1990. 7p. Order Number DE90623383. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Within the framework of Becchi-Rouet-Stora stochastic quantization we show that the choice of a metric in the BRST phase space is related to the conventional gauge fixing procedure. 6 refs. (Author).

29615 (UWThPh–1990-7) **Bounds on the order of vanishing of eigenfunctions of Schroedinger operators.** Hoffmann-Ostenhof, M. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik); Hoffmann-Ostenhof, T. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 21 Feb 1990. 16p. Order Number DE90623384. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

We study L^2-solutions of $(-\Delta+V-E)\psi = 0$ in R^n, $n \geq 2$ and derive a sharp upper bound to $l_{x_0}(\psi)$ in terms of x_0, E and V under rather restrictive assumptions on V. We show for V smooth that an upper bound to $l_{x_0}(\psi)$ implies an upper bound to the dimension of the eigenspace associated to E. 16 refs. (Authors).

29616 **A boundary integral approach to unstable solidification.** Strain, J. (Lawrence Berkeley Laboratory, Berkeley, California (USA)). *Journal of Computational Physics (USA),* 85(2): 342-389 (Dec 1989). DOE Contract AC03-76SF00098.

We consider the supercooled Stefan problem with a general anisotropic curvature- and velocity-dependent boundary condition on the moving interface. We present numerical methods, based on an integral equation formulation and including a new algorithm for moving curves with curvature-dependent velocity. These methods compute a periodic interface with $O(\Delta t)$ accuracy, where Δt is the time step. Previous work has been limited to short time spans and achieved slightly less than $O(\Delta t^{1/2})$ accuracy. Accurate numerical results are seen to agree with the predictions of linear stability theory. This agreement has eluded previous authors, because their numerical methods suffered from grid effects and their linear stability theory was incorrect. We study the long-time evolution of an unstable interface. Our computations exhibit the beginnings of a sidebranching instability when the boundary condition includes anisotropy and tip-splitting in the isotropic case. © 1989 Academic Press, Inc.

29617 Multifractal properties of snapshot attractors of random maps. Romeiras, F.J. (Laboratory for Plasma Research, University of Maryland, College Park, Maryland 20742 (USA)— Centro de Electrodinamica (INIC), Instituto Superior Tecnico, 1096 Lisboa Codex, (Portugal)); Grebogi, C.; Ott, E. *Physical Review, A (General Physics) (USA),* 41(2): 784-799 (15 Jan 1990).

We consider qualitative and quantitative properties of "snapshot attractors" of random maps. By a random map we mean that the parameters that occur in the map vary randomly from iteration to iteration according to some probability distribution. By a "snapshot attractor" we mean the measure resulting from many iterations of a *cloud* of initial conditions viewed at a *single* instant (i.e., iteration). In this paper we investigate the multifractal properties of these snapshot attractors. In particular, we use the Lyapunov number partition function method to calculate the spectra of generalized dimensions and of scaling indices for these attractors; special attention is devoted to the numerical implementation of the method and the evaluation of statistical errors due to the finite number of sample orbits. This work was motivated by problems in the convection of particles by chaotic fluid flows.

29618 One-dimensional nonlinear Schroedinger equation: A nonlinear dynamical approach. Wan, Y. (Ames Laboratory and Department of Physics—Iowa State University, Ames, Iowa 50011 (USA)); Soukoulis, C.M. *Physical Review, A (General Physics) (USA),* 41(2): 800-809 (15 Jan 1990). DOE Contract W-7405-ENG-82.

We have studied a time-independent nonlinear Schroedinger equation of the tight-binding form on a one-dimensional lattice. The real and complex wave functions as solutions to the equation are considered separately for different physical problems. For each case, an area-preserving map for the discrete nonlinear Schroedinger equation is introduced and analyzed. The bounded solutions can be organized in hierarchies composed of periodic, quasiperiodic, as well as chaotic orbits on the phase plane of the nonlinear map. A "stability-zone" diagram, where the bounded orbits exist, is displayed in the parameter space, serving as "phase diagram" of the nonlinear Schroedinger equation under appropriate boundary conditions. Studies of the stability zone yield useful information for the physical problems considered. The periodic orbits and their stabilities can be obtained by a convergent perturbation method. Finally, we remark on several physical problems where these results might be applicable. In particular, we discuss the stabilities of the large polaron solution in the Holstein model.

29619 Conductivity tensor of anisotropic composite media from the microstructure. Torquato, S. (Department of Mechanical and Aerospace Engineering—Department of Chemical Engineering, North Carolina State University, Raleigh, North Carolina 27695-7910 (US)); Sen, A.K. *Journal of Applied Physics (USA),* 67(3): 1145-1155 (1 Feb 1990). DOE Contract FG05-89ER45384.

Perturbation expansions and rigorous bounds on the effective conductivity tensor σ_e of d-dimensional anisotropic two-phase composite media of arbitrary topology have recently been shown by the authors to depend upon the set of n-point probability functions $S^{(i)}_1,\ldots, S^{(i)}_n$. $S^{(i)}_n$ gives the probability of simultaneously finding n points in phase i (i=1,2). Here we describe a means of representing these statistical quantities for distributions of identical, oriented inclusions of arbitrary shape. Our results are applied by computing second-order perturbation expansions and bounds for a certain distribution of oriented cylinders with a finite aspect ratio. We examine both cases of conducting cylindrical inclusions in an insulating matrix and of insulating *cracks* or *voids* in a conducting matrix.

29620 Generalized Brownian dynamics. II. Vibrational relaxation of diatomic molecules in solution. Smith, D.E. (Department of Chemistry, University of California, Berkeley, California 94720 (US)— Materials and Chemical Sciences Division, Lawrence Berkeley Laboratory, Berkeley, California 94720 (US)); Harris, C.B. *Journal of Chemical Physics (USA),* 92(2): 1312-1319 (15 Jan 1990).

A simple classical stochastic model for diatomic vibrational relaxation, based on the generalized Langevin equation, is presented. The memory function in the generalized Langevin equation is determined directly from equilibrium force autocorrelation functions for the individual atoms of the diatomic dissolved in the solvent of interest. A simple autoregressive (AR) procedure, developed in a preceding paper [D. E. Smith and C. B. Harris, J. Chem. Phys. **92**, 1304 (1990)], is used for modeling the memory functions to arbitrary order. This model is tested on the system of iodine in Lennard–Jones xenon using fourth order AR approximations for the memory functions, and is found to be very effective in reproducing data from molecular dynamics simulations at two very different densities. Results are discussed in terms of the simplifying assumption that the solvent interaction with the diatomic can be characterized by equilibrium dynamics of single atoms in solution.

29621 Generalized Brownian dynamics. I. Numerical integration of the generalized Langevin equation through autoregressive modeling of the memory function. Smith, D.E. (Department of Chemistry, University of California, Berkeley, California 94720 (US)— Materials and Chemical Sciences Division, Lawrence Berkeley Laboratory, Berkeley, California 94720); Harris, C.B. *Journal of Chemical Physics (USA),* 92(2): 1304-1311 (15 Jan 1990).

A method is presented for numerical integration of the generalized Langevin equation (GLE) based on modeling of the "random force" as a discrete autoregressive process. This modeling procedure, drawn from digital signal processing and spectral estimation methods which have been used extensively in electrical engineering applications, provides for efficient evaluation of the friction integral in the GLE as well as for generation of a random force process with the desired spectrum. The method is shown, through comparison with molecular dynamics results, to be effective in simulating the force autocorrelation function of an iodine atom dissolved in Lennard-Jones (LJ) xenon. In a companion paper this method is applied in a simulation of the vibrational relaxation of I_2 in LJ xenon at two very different densities and found to perform well.

70 FUSION ENERGY

29622 (IPPCZ–293/I) **15th Czechoslovak seminar on plasma physics and technology. Part 1.** Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. 159p. (In English, Russian). (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Of the 17 papers contained in the proceedings, 8 papers deal with various technological applications of a low-temperature plasma, e.g., the synthesis of very high-purity materials and ultrafine powders, plasma polymerization, and plasma deposition of composite superconducting films. Two papers review the activity in the field of mathematical modeling and experimental investigation of electric arcs used in industrial and laboratory plasmatrons. Other papers report the results of varous diagnostic methods (IR and optical spectroscopy, CARS spectroscopy, probes and interferometry) applied to low-temperature laboratory and technological plasmas. In one paper the positive streamer phenomenon in electric discharges is discussed. (J.U.).

29623 (CONF-900557–1) **The ATF two-frequency correlation reflectometer.** Hanson, G.R.; Wilgen, J.B.; Anabitarte, E.; Bell, J.D.; Harris, J.H.; Dunlap, J.L.; Thomas, C.E. Oak Ridge National Lab., TN (USA). [1990]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 8. topical conference on high-temperature plasma diagnostics; Hyannis, MA (USA); 6-10 May 1990. Order Number DE90010434. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The Advanced Toroidal Facility (ATF) density fluctuation reflectometer system consists of two individual reflectometers operating in the 30- to 40-GHz band. Each reflectometer consists of a tunable microwave source and a quadrature phase detector connected to the same antenna system. This arrangement allows two-frequency operation along the same radial chord for radial coherence measurements. The technique used in making radial coherence measurements is discussed and the results of such experiments are given. Initial experiments have shown high coherence when the frequencies of the two reflectometers are tuned close together and a clear loss of coherence as the radial separation of the cutoff layers is increased by increasing the frequency separation of the two reflectometers. Recent results have shown that local measurements of density fluctuations in plasmas with electron cyclotron heating (ECH) are possible and that detailed structure can be seen in the fluctuation spectra. In addition, radial correlation lengths have been found to be from 0.5 to 1.0 cm in ECH plasmas, with some frequency structures having correlation lengths up to 3 cm. In plasmas with neutral beam injection (NBI), the radial correlation lengths in the edge region have been found to be approximately 0.1–0.2 cm. 4 figs.

29624 (CONF-900602–1) **Density fluctuation measurements on the ATF [Advanced Toroidal Facility] using a two-frequency reflectometer.** Anabitarte, E. (Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas, Madrid (Spain). Inst. de Energias Renovables); Hanson, G.R.; Harris, J.H.; Wilgen, J.B.; Bell, J.D.; Dunlap, J.L.; Hidalgo, C.; Thomas, C.E.; Uckan, T. Oak Ridge National Lab., TN (USA). [1990]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 17. European conference on controlled fusion and plasma heating; Amsterdam (Netherlands); 25-29 Jun 1990. Order Number DE90009810. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A microwave reflectometer system has been installed and operated on the Advanced Toroidal Facility (ATF) to measure density fluctuations. This system consists of two individual reflectometers that use the same antenna system and operate in the 30- to 40-GHz band. This arrangement allows operation at two frequencies along the same radial chord so that radial coherence measurements are possible. During the initial operating period of the reflectometer, a correlation was observed between a change in the edge density fluctuation spectrum and a transition to improved confinement. Recently, local measurements of the density fluctuation spectra in electron-cyclotron-heated (ECH) plasmas has been shown to agree with Langmuir probe measurements at the edge. Furthermore, structure in the spectra has been observed in some ECH plasmas. 4 refs., 3 figs.

29625 (CONF-900602–3) **Impurity transport in ATF [Advanced Toroidal Facility] and the effect of controlled impurity injection.** Horton, L.D. (Oak Ridge National Lab., TN (USA)); Isler, R.C.; Crume, E.C. Jr.; Jernigan, T.C.; Morita, S. Oak Ridge National Lab., TN (USA). [1990]. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 17. European conference on controlled fusion and plasma heating; Amsterdam (Netherlands); 25-29 Jun 1990. Order Number DE90009826. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The operating window in the Advanced Toroidal Facility (ATF) is limited by the occurrence of a sudden decrease in energy confinement. Although it is clear that the final loss of confinement is due to thermal instability at low temperature, the cause of the initial degradation that reduces the plasma temperature to this low range is not clear. A series of experiments using impurities injected either by a fast gas puffing system or by a laser ablation system has been carried out to study the role of impurities in initiating these collapses of energy confinement. For the experiments described here the injected impurities were aluminum and scandium.

29626 (CONF-900602–5) **Bootstrap current studies in the Advanced Toroidal Facility.** Murakami, M.; Carreras, B.A.; Bigelow, T.S.; Dyer, G.R.; England, A.C.; Glowienka, J.C.; Hiroe, S.; Howe, H.C.; Jernigan, T.C.; Rasmussen, D.A. Oak Ridge National Lab., TN (USA); National Inst. for Fusion Science, Nagoya (Japan); Georgia Inst. of Tech., Atlanta, GA (USA). [1990]. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 17. European conference on controlled fusion and plasma heating; Amsterdam (Netherlands); 25-29 Jun 1990. Order Number DE90009859. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The toroidal current observed during electron cyclotron heating (ECH) in the Advanced Toroidal Facility (ATF) torsatron is identified as bootstrap current. The observed current ranges between +3 kA and −1 kA with negligible Ohmic heating (OH) and ECH-driven currents. The observed currents agree well with predictions of neoclassical theory in magnitude (to within 30%) and parametric dependence (including the reversal of the current), as determined by systematic scans of quadrupole (shaping) and dipole (vacuum axis shift) moments of the vertical field. These results show that the current flow in ATF is well described by the neoclassical theory of bootstrap current despite the presence of anomalies in particle and heat flows. In addition, the results demonstrate the ability to control the toroidal current with the vertical field for currentless operation in stellarators. 5 refs., 5 figs.

29627 (CTH-IEFT/PP–1988-19) **Dissipative trapped electron effects on toroidal η_i-mode stability.** Jarmen, A. Chalmers Univ. of Tech., Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics. 1988. 31p. Order Number DE90623626. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

A quadratic dispersion relation is derived for ion temperature gradient driven modes in toroidal geometry without any expansion in inverse aspect ratio and including the effect of dissipative trapped electrons. It is shown that for finite trapping the η_i-mode stability thresholds are discontinously shifted compared to the case without trapping. Furthermore the thresholds are not sensitive to the magnitude of the trapping. A stability requirement on the density scale length L_n which has to be larger than about half the major radius R and an upper and a lower η_i stability threshold which grow linearly with $\pm 2L_n/R$ are derived. (orig.).

29628 (DOE/ET/53088–424) **Wave-particle power transfer in a steady-state driven system.** Berk, H.L.; Breizman, B.N.; Hamaguchi, S. Texas Univ., Austin, TX (USA). Inst. for Fusion Studies. Mar 1990. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-80ET53088. (IFSR–424). Order Number DE90010031. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The general expression of the power transfer from a high-energy ion beam to a background electrostatic plasma wave is obtained as a function of an arbitrary wave amplitude. The injection ions are assumed to slow down through classical transport processes and form a weakly destabilizing distribution function. It is verified that phase space gradients produced by a finite amplitude wave enhances the power transfer significantly, as was also indicated in earlier work. 4 refs., 3 figs.

29629 (DOE/ET/53088–426) **Resonant MHD modes with toroidal coupling: Part 1, Tearing modes.** Connor, J.W. (UKAEA Culham Lab., Abingdon (UK)); Hastie, R.J.; Taylor, J.B. Texas Univ., Austin, TX (USA). Inst. for Fusion Studies. Mar 1990. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-80ET53088. (IFSR–426). Order Number DE90010077. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

In a cylindrical plasma, tearing modes can be calculated by asymptotic matching of ideal mhd solutions across a critical layer. This requires a quantity Δ' which represents the 'discontinuity' in the ideal solution across the layer. In a torus, poloidal harmonics

are coupled and there are many critical surfaces for each toroidal mode number, and correspondingly many discontinuities Δ'_m. The ideal mhd solutions do not determine the Δ'_m but only a relation between them–described by an "E-matrix." We discuss the calculation of the E-matrix for a large aspect-ratio tokamak. In a weak-coupling approximation it is tri-diagonal and can be computed from integrals over the uncoupled eigenfunctions or from simple "basis-functions" comprising triplets of coupled poloidal harmonics. This weak coupling approximation fails if Δ'_m is already small for an uncoupled harmonic. An alternative strong-coupling approximation is developed for this case. 9 refs.

29630 (GA-A–20024) **Three-dimensional simulations of simple electron drift wave turbulence in tokamak geometry.** Waltz, R.E. General Atomics Co., San Diego, CA (USA). Mar 1990. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-89ER53277. (CONF-900237–1: Conference on research trends in nonlinear and relativistic plasma physics, San Diego, CA (USA), 2-8 Feb 1990). Order Number DE90009581. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A three-dimensional code is used to study the scaling of an electrostatic electron drift wave turbulence with respect to shear and curvature of the tokamak magnetic field as well as the driving strength. The electrons are modeled with a simple formula for the deviation from a near Boltzmann response and the ions are modeled as a nonlinear fluid. For sheared slab geometry suppressing curvature (or toroidal) effects, the turbulence level and transport scale according to the mixing length given by the linear normal mode widths and the poloidal wavelengths scaled to the ion gyroradius. Toroidal coupling results in a more complex behavior. 16 refs., 9 figs., 1 tab.

29631 (GA-A–20031) **Parasitic coupling of the fringing fields of an Ion-Bernstein wave antenna.** Chiu, S.C. (General Atomics, San Diego, CA (USA)); Chan, V.S.; Perkins, F.W.; Puri, S. General Atomics, San Diego, CA (USA). Apr 1990. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-89ER53277. (CONF-900602–6: 17. European conference on controlled fusion and plasma heating, Amsterdam (Netherlands), 25-29 Jun 1990). Order Number DE90009918. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Ion-Bernstein wave (IBW) heating is an important method of heating a tokamak plasma. In past experiments, the loading of an IBW antenna is known to be considerable higher than that predicted by linear theory. It was attributed to background loading due to unknown mechanisms. Here, we propose that a possible mechanism is the coupling of the fringing fields of the Faraday screen to a short wavelength electrostatic mode. This mode is highly dissipative and can be propagative or evanescent, depending on the edge parameters. The problem is formulated as a mixed boundary value problem and solved by singular integral technique. Numerical results indicate that this can be significant parasitic coupling mechanism whose magnitude at typical edge parameters can be significantly larger than the coupling to the desired IBW. It is insensitive to variation in magnetic field, which is in sharp contrast to theoretical predictions for IBW coupling. The dependence of the coupling to plasma and antenna parameters will be presented. Relevance to experiments will be discussed. 11 refs., 4 figs.

29632 (IPPCZ–284) **Control of plasma position in the CASTOR tokamak.** Valovic, M. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Nov 1988. 16p. Order Number DE90623583. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

A simple servo-system designed for plasma position control in the CASTOR tokamak is described. Both radial and vertical plasma displacements were minimized using two servo-loops consisting of detection coils, a conventional electric controller and an amplifier operated as an unipolar voltage-controlled current source. To ensure the optimum conditions in the start-up phase of the discharge, currents in the servo-systems were externally preprogrammed. The prescribed plasma position was maintained with the accuracy of 3 mm. The feedback control improves plasma parameters, e.g. it removes the positional disruption at the end of the tokamak discharge. (J.U.). 4 figs., 3 refs.

29633 (IPPCZ–285) **Electron cyclotron emission and absorption experiment on the CASTOR tokamak.** Fedorenko, S.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii); Stoeckel, J.; Valovic, M.; Zacek, F. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Nov 1988. 15p. Order Number DE90623584. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Electron cyclotron radiation and absorption measurements on the CASTOR tokamak are reported. Emission spectra were obtained using fast-scanning Fourier spectrometer and InSb detectors, operating in the spectral range 30 to 300 GHz and receiving two orthogonal polarization components simultaneously. In the high plasma loop voltage runaway electrons gave rise to an intense broad-band emission. Runaway particles can be removed by increasing the plasma density. The electron temperature profile was deduced from thermal emission and absorption around second cyclotron harmonics. From the second and third harmonics of the non-thermal emission the energy and number of non-thermal particles can be calculated. During the lower-hybrid-current-drive (LHCD) experiments, the presence of 60 keV electrons with density of 1.10^{16} m^{-3} was deduced from emission spectra. (author). 5 figs., 6 refs.

29634 (IPPCZ–286) **Gas-puff Z-pinch experiment.** Krejci, A. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Nov 1988. 22p. Order Number DE90623585. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The fast linear Z-pinch was experimentally investigatedusing a pulse high-current generator (10.8 μF, 5 to 10 kJ. 150 to 250 kA) and a pulse injectionof argon and neon. Measured electrical characteristics of the discharge (current shape and risetime, inductance) and calculated dynamic parameters of plasma implosion (accelerated mass, radial plasma velocity) are presented. X-ray diagnostics with temporal resolution (vacuum X-ray diodes, semiconductor detectors) were utilized. The temperature and the density of pinch plasma ($T_e \simeq 50$ eV, $n_e \simeq 1.4x10^{26}$ m^{-3}) and its size and lifetime were estimated. Total energy emitted by pinch in ultra-soft X-ray region ($h\nu<1$ keV) during $\approx$ 200 ns pulse achieves 125 $J/4\pi$. (author). 5 figs., 1 tab., 16 refs.

29635 (IPPCZ–287) **Calculations of soft X-ray emission of REB-heated plasma.** Raus, J.; Babicky, V. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Jan 1989. 41p. Order Number DE90623586. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The non-stationary corona model was used for the calculation of time-dependent soft X radiation spectra of REB-heated hydrogen plasma with 1% of oxygen. Electron impact ionization and excitation, spontaneous radiative decay and radiative and dielectronic recombination were taken into account. The plasma temperature was assumed to increase instantaneously to several tens of eV at the time t=0, remaining constant afterwards. The set of differential equations for ionization states of oxygen was solved using the Euler method. The plasma radiation spectra were computed in the range of 5 eV to 5 keV. The intensity of the continuum radiation component was is found to be not higher than 1% of that of the impurity lines. The theoretical signals of several X-ray detectors with various filters, calculated on the base of the time-dependent spectra obtained, may be directly compared with experimental data. (J.U.). 25 figs., 2 tabs., 26 refs.

29636 (IPPCZ–289) **Hot spots in Ar and Ne gas puff Z-pinch.** Krejci, A. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu); Krousky, E.; Renner, O. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Feb 1989. 9p. Order Number DE90623587. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

The hot spots in Ar and Ne pinch plasma were investigated. Two pinhole cameras with entrance diameter 13 to 250 μm and flat crystal spectrographs with Si and KAP crystals were used for spatially and spectrally resolved soft X-ray diagnostics. The diameters of Ar (25 to 30 μm) and Ne (40 μm) hot spots were found. From X-ray spectrum of Ar spots the following plasma parameters were determined: T_e=1.0 to 1.1 keV and n_e=(1.8 to 4.0)x10^{27} m^{-3}. The

validity of the Bennett equilibrium for unstable hot spots is discussed. (author). 1 fig., 11 refs.

29637 (IPPCZ–290) **Computation of coupling elements between waveguides and modes for large launching structures.** Hurtak, O.; Preinhaelter, J. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. 18p. Order Number DE90623632. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Optimization of large launching structures - grills and multijunction grills which are intended for lower hybrid current drive in big tokamaks - calls for quick and sufficiently precise computation of the coupling elements between waveguides and modes. The original method of computation is described which is efficient for small structures only and is based on integration along the real axis. For computation of coupling elements between more distant waveguides another method of integration is developed which uses a shift of the integration path. For this purpose, the analytical continuation of the plasma surface impedance into the complex N_z-plane is calculated and a new numerical code developed. Some numerical results are given to compare both methods. A combination of both methods speeds up the computation needed for the grill design. (author). 2 figs., 2 tabs., 2 refs.

29638 (IPPCZ–291) **Solar flares and dynamics of Langmuir waves in current-carrying plasmas.** Jungwirth, K. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu); Karlicky, M. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. 40p. Order Number DE90623633. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The dynamics of intense Langmuir waves in current-carrying plasma is studied both analytically and numerically. Starting with the widely used Zakharov equations adapted to these systems, specific features of the problem are pointed out. The role of resonant particles is analyzed. Using a one-dimensional macroparticle numerical code, nonlinear regimes of modified-decay and modulational instabilities are modelled. An efficient cooperation of essentially ponderomotive and electron-ion drift effects is demonstrated. It appears that the heating of a current-carrying plasma can be activated by releasing the inductively stored energy, due to the enhanced conversion of energy associated with the electron drift motion. The underlying physics is discussed and its relationship to the solar flare theory is suggested. (author). 6 figs., 1 tab., 30 refs.

29639 (IPPCZ–292) **Quasilinear approach to the damping of LH waves in a reactor-grade plasma.** Pavlo, P.; Krlin, L.; Tluchor, Z. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Jun 1989. 31p. Order Number DE90623588. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The results are presented of a computer simulation of the lower hybrid current drive (LHCD) for ITER parameters. The damping of lower hybrid waves on alpha particles, due to the interaction at high cyclotron resonances, is obtained by solving the two-dimensional Fokker-Planck equation with the corresponding quasilinear term (FPA code). This code is incorporated into a one-dimensional LHCD code so as to obtain radial profiles of the RF power transferred to electrons and alpha particles as well as that of the driven current. A noticeable absorption by alpha particles is observed only below 5 GHz of the generator frequency and is bearable down to 3 GHz (22% of the input power with only 10% reduction in the total driven current for an optimized input spectrum.) The absorption is accompanied by acceleration of a group of alpha particles much above their born velocity. RF-induced alpha aprticle losses are found to be too small to affect the energy balance but may contribute to the deterioration of the first wall. Some further mechanisms not included into the code but possibly affecting the interaction are discussed. (author). 9 figs., 1 tab., 14 refs.

29640 (IPPCZ–293/I, pp. 1-23) **Generalization of characteristics of electric arc discharges.** Yas'ko, O.I. (AN Belorusskoj SSR, Minsk (Byelorussian SSR). Inst. Teplo- i Massoobmena). Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (In Russian). (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Use of the similarity theory in formulating generalized laws for complex physical systems such as various arc discharges exploited in laboratory and industrial plasmatrons, meets with serious difficulties. After having identified the predominant physical processes, we can nevertheless find for each such process one dimensionless parameter which can be used in generalized formulae. The plasma characteristics can then be expressed by a small number of dimensionless parameters; as a rule the parameters are different for different working gases. Recently a new approach to mathematical modeling of arcs was proposed, based on an analysis of the temperature dependence of plasma characteristics. The application of this method to the construction of generalized volt-ampere characteristics of arcs is shown by several examples. (J.U.).

29641 (IPPCZ–293/I, pp. 57-68) **Spectral characteristics of chemically active high-pressure plasma used for silicon nitride synthesis.** Simek, M. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu); Taras, P. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Emission spectra of hydrogen-nitrogen-silicon tetrachloride plasma mixtures were obtained as part of an investigation of high-pressure plasma reactivity aimed at the synthesis of nitrides. The plasma stream with the mass temperature of 5800 K was produced by an arc plasmatron with two gas inputs. $SiCl_4$ vapors in nitrogen carrier gas were injected radially downstream the anode nozzle. The emission spectra were analyzed by means of a Jobin-Yvon HR-320 on-line spectrograph. The influence of the hydrogen admixture on spectra of diatomic molecules such as SiN and SiH was studied. The number of SiN radicals found in the experiment was relatively low. It may be concluded that under the conditions of the experiment, nitrogen-containing compounds can be prepared only using hydrogen-nitrogen mixtures. (J.U.).

29642 (IPPCZ–293/I, pp. 69-83) **Plasma temperature measurements based on discrete atomic and molecular spectra - a critical discussion.** Zyrnicki, W. (Politechnika Wroclawska, Wroclaw (Poland). Inst. Chemii Nieorganicznej i Metalurgii Pierwiastkow Rzadkich). Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

The analysis of emission spectra is an indispensable tool when studying the processes in chemically reacting plasmas, the plasma temperature being the most important and most frequently studied plasma parameter. The concept of plasma temperature is discussed in detail and the methods used for measurements of translational, vibrational, rotational and excitation temperatures are surveyed. The sources of inaccuracy of each method are critically analyzed and the role of microcomputers in spectroscopic data processing is emphasized. (J.U.).

29643 (IPPCZ–293/I, pp. 84-98) **Spectroscopic diagnostics of some plasmas used in technology processes.** Zyrnicki, W. (Politechnika Wroclawska, Wroclaw (Poland). Inst. Chemii Nieorganicznej i Metalurgii Pierwiastkow Rzadkich); Kulakowska, B.; Borkowska-Burnecka, J.; Taras, P.; Dudas, J. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

The results are presented of joint spectroscopic studies of technological plasmas performed within the framework of sci-tech

cooperation of IPP, Prague and IICMRE, Wroclaw. The plasma spectra were recorded in Prague and analyzed in Wroclaw. In the first experiment a water plasma was generated by the Czechoslovak water-stabilized plasmatron PAL 160. Both a pure water plasma and that with additions of $ZrSiO_4$, Al_2O_3 and Al powders were investigated. In the second experiment a plasma jet producing a mixed hydrogen-nitrogen-$SiCl_4$ plasma was used. In the first experiment the spectra were recorded on ORWO plates by means of prism spectrograph Q 24. In the second experiment, Kodak plates and planar grating spectrograph PGS-2 were used. (J.U.).

29644 (IPPCZ–293/I, pp. 99-111) **On the potential of CARS spectroscopy in low-temperature plasma diagnostics.** Ambrazyavichyus, A.B. (AN Litovskoj SSR, Kaunas (USSR). Inst. Fiziko-Tekhnicheskikh Problem Ehnergetiki); Gladkov, S.M.; Grigajtis, Yu.P.; Koroteev, N.I. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (In Russian). (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

The principles of coherent anti-Stokes Raman spectroscopy (CARS) and its application to the diagnostics of technological plasmas are briefly discussed. THe CARS spectrometer is described, developed in IPTPE, Caunas for investigations of a nitrogen plasma stream generated by an industrial plasmatron, and several CARS spectra of nitrogen molecules are presented. As the CARS signal from vibrational-rotational energy levels decreases substantially at plasma temperatures above 2000 K, an alternative scheme using electronlevels of atoms or ions has to be used. To test the method, CARS signals from the lines of the first nitrogen ion were studied in a low-voltage spark discharge. (J.U.).

29645 (IPPCZ–293/I, pp. 112-115) **The spectroscopic study of $SiCl_4$ in 400 kHz low pressure plasma etch reactor.** Jurani, R. (Komenskeho Univ., Bratislava (Czechoslovakia)); Trnovec, J. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

The low-pressure high-frequency $SiCl_4$ discharge was studied spectroscopically in the range of 250-610 nm by means of the SPM-2 monochromator (Zeiss Jena). The typical discharge spectrum is presented and the observed and missing emission lines are identified. Discussed are some features of kinetics of the gas-phase processes which may be deduced from the experimental data. The physical mechanism responsible for two broad emission bands observed around 400 nm and 575 nm, however, remains unknown. (J.U.).

29646 (IPPCZ–293/I, pp. 129-134) **Substrate temperature distribution in microwave plasma used for polymer deposition.** Ohl, A. (Akademie der Wissenschaften der DDR, Greifswald (German Democratic Republic). Zentralinstitut fuer Elektronenphysik); Schmidt, M. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Thin film deposition in a microwave-generated plasma is studied. The finite depth of microwave penetration into the plasma results in a spatial inhomogeneity of plasma parameters and complicates the solution of energy balance equations at the substrate. In the investigation of plasma polymerization of hexamethyl disiloxane the substrate temperature is a critical parameter. Therefore, a special experimental setup was developed which makes it possible to measure the spatial distribution of temperature along the substrate. The experimental results are in good agreement with calculations based on a simple energy balance model. (J.U.).

29647 (IPPCZ–293/I, pp. 143-145) **Quick gas rotational temperature determination in a plasma reactor.** Janca, J. (Universita J.E. Purkyne, Brno (Czechoslovakia). Prirodovedecka Fakulta); Brablec, A.; Skricka, L.; Tesar, C. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Up to 1000 K the gas rotational temperature may be quickly determined from the measured spectral intensity of the second positive system (vibrational band 2-0) of a nitrogen molecule, making use of the pronounced temperature sensitivity of the shallow saddle minimum in the vibrational band. The results obtained theoretically were verified experimentally in a high-frequency excited nitrogen plasma. (J.U.).

29648 (IPPCZ–293/I, pp. 146-152) **Time stability influence of the FPI on the accuracy of measurement of spectral line profiles in plasma physics.** Stastny, F. (Universita J.E. Purkyne, Brno (Czechoslovakia). Prirodovedecka Fakulta); Brablec, A. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

The stability in time of Fabry-Perot interferometers with piezoelectric scanning of the line profiles is a problem in plasma diagnostics when spectral line profiles are to be measured with great accuracy. Stability tests were performed with a computer-controlled RC 150 (Burleigh, USA) interferometer. The experimental data revealed a systematic change of the interferometer constant on a long time scale, which cannot be neglected in accurate measurements. (J.U.).

29649 (IPPCZ–293/I, pp. 156-158) **Optical diagnostics of discharges.** Kapicka, V. (Universita J.E. Purkyne, Brno (Czechoslovakia). Prirodovedecka Fakulta); Kovar, L.; Tesar, C. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Some results of rotational temperature measurements in a capacity-coupled high-frequency discharge and of interferometric measurements of radial temperature distribution in an electric arc are reported. (J.U.).

29650 (IPPCZ–293/I, pp. 159) **Interference and schlieren diagnostics of current sheath generated by coaxial gun.** Kravarik, J. (Ceske Vysoke Uceni Technicke, Prague (Czechoslovakia). Fakulta Elektrotechnicka); Kubes, P. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. 29651 (IPPCZ–293/I, pp. 153-155) **Double probe characteristics in the case of nonmaxwellian distributions of electrons.** Ferdinand, J. (Vysoka Skola Strojni a Elektrotechnicka, Plzen (Czechoslovakia)). Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Contrary to the single Langmuir probe method, the electron temperature determined from the double probe characteristics by using the classical Malter-Johnson formula is independent of the electron energy distribution. The double probe method can therefore be used even when the detailed course of the electron distribution function is not known. (J.U.).

29652 (IPPCZ–293/I, pp. 116-118) **A study of equilibrium in argon arcs.** Vicek, J. (Vysoka Skola Strojni a Elektrotechnicka, Plzen (Czechoslovakia)). Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. May 1989. (CONF-8903207–: 15. Czechoslovak seminar on plasma physics and technology, Liblice (Czechoslovakia), 13-17 Mar 1989). In *15th Czechoslovak seminar on plasma physics and technology. Part 1.* Order Number DE90623578. Available from NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

An extensive collisional-radiative model of an argon plasma is applied to atmospheric and subatmospheric arcs in argon. The deviations from local thermal equilibrium in these discharges are studied. The calculated values of the Boltzmann decrement are compared with those obtained in various experiments. (J.U.).

29653 (IPP–III/139) **ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988.** Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. 149p. Order Number DE90780658. Available from NTIS (US Sales Only), PC A07/MF A01.

This report contains 10 lectures on various aspects of plasma - surface interactions and on plasma edge theory. (WL).

29654 (IPP–III/139, pp. 1-13) **Impurity accumulation studies in pellet-refuelled ASDEX discharges.** Fussmann, G.; Krieger, K.; Nolte, R.; Roehr, H.; Steuer, K.H. ASDEX Team. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. In *ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988.* Order Number DE90780658. Available from NTIS (US Sales Only), PC A07/MF A01.

Pellet injection into ASDEX discharges allows considerable improvement of the confinement properties. Simultaneously with this improvement a strong accumulation of metallic impurities is observed, which leads to intolerable cooling of the plasma core region. We discuss the experimental phenomena and the underlying transport changes associated with the accumulation. (orig.).

29655 (IPP–III/139, pp. 14-33) **Characterization of the ASDEX scrape-off-layer density profile during neutral beam heating.** McCormick, G.K.; Pietrzyk, Z.A. ASDEX Team; NI-Team. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. In *ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988.* Order Number DE90780658. Available from NTIS (US Sales Only), PC A07/MF A01.

The scrape-off-layer (SOL) density profile is characterized by the density at the separatrix n_s, and the e-folding length λ_n for ohmic and H^0-neutral-injection-heated (NI) plasmas at power levels P_{NI} leading either only to the L-mode (low power injection: P_{NI} = 0.4 - 1.7 MW), or to the H-mode (high power injection: P_{NI} = 2.4 - 3.4 MW). Behavior of the SOL at low P_{NI} is studied over the ranges: anti n_e = 1-5 x $10^{13}/cm^3$, I_p = 270 - 420 kA and B_t = 21.8 kG, for D^+ and He^{++} (only 420 kA) discharges. It is found: $n_s(OH) \propto$ anti $n_e\ I_p^{0.25}$; $n_s(L) \propto$ anti $n_e\ I_p^{-0.5}$ and $\lambda_n(OH+L) \propto$ anti $n_e^{-0.22}\ I_p^{-0.6}\ P_{tot}^{0.19}$, where P_{tot} is the total power absorbed by the plasma. More explicitly, n_s is proportional to anti n_e, whereby the constant of proportionality increases at the onset of NI, but is independent of P_{NI}. (orig.).

29656 (IPP–III/139, pp. 53-67) **The low energy neutral fluxes and their impurity production at the walls of ASDEX.** Verbeek, H.; Dose, V.; Fu, J.K.; Gehre, O.; Gernhardt, J.; Janeschitz, G.; Mueller, E.R.; Roehr, H.; Steuer, K.H.; Soeldner, F.X. ASDEX Team. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. In *ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988.* Order Number DE90780658. Available from NTIS (US Sales Only), PC A07/MF A01.

With the Low Energy Neutral particle Analyser LENA at ASDEX the density dependence of the neutral flux, its mean energy and its impurity production at the walls has been investigated for ohmic hydrogen and deuterium discharges. For hydrogen a large increase of the neutral flux with increasing density was observed, while the mean energy of the neutrals decreases. This holds for hydrogen over the whole range of densities. At constant density the low energy neutral flux increases with the safety factor q. This is in contrast to the high energy flux as measured with the charge exchange analyser. The flux increase of the low energy neutrals can be correlated with the increased decay length of the electron density for higher q-values. For deuterium the same behaviour up to densities of $n \simeq 3.5 \times 10^{13}$ cm^{-3} was observed. For higher densities the flux behaves different corresponding to the different confinement regimes. Only in the regime of saturated ohmic confinement, known so far, the flux increases further with increasing n. With the operational conditions of the new divertor configuration in ASDEX a further increase of τ_E with n up to the density limit was observed (improved Ohmic confinement). In this regime the neutral flux saturates with increasing n. In spite of the reduced impurity production at the walls, Z_{eff} increases in this case. (orig.).

29657 (IPP–III/139, pp. 68-82) **Charge exchange neutral sputtering in ASDEX.** Staudenmaier, G. (Association Euratom-Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)); Wampler, W.R. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. Contract DE-AC04-76DP00789. In *ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988.* Order Number DE90780658. Available from NTIS (US Sales Only), PC A07/MF A01.

Neutral fluxes to the wall of ASDEX were measured with a new energy-resolving carbon resistance probe, CRP, combined with a mechanical shutter, providing time resolution. With the new CRP having two silicon overlayers of different thickness the non-Maxwellian energy distribution of the charge exchange neutrals can be approximately determined. Using the flux and the mean energy of the particles from the resistance probe measurements, one can calculate the flux of impurities generated by sputtering. Various discharges were investigated. High impurity fluxes were observed in discharges with high power auxiliary heating. Low impurity fluxes were observed in pellet-refuelled discharges and during neutral beam heating in counter direction and H-mode discharges refuelled with pellets. Charge exchange neutral sputtering is an important impurity source representing a lower limit for impurity generation. (orig.).

29658 (IPP–III/139, pp. 83-95) **Erosion and retention of the target plate material in the ASDEX divertor.** Janeschitz, G. (Association Euratom-Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)); Fussmann, G.; Hofmann, J.; Roth, J.; Taglauer, E.; Ran, L.B.; Yang, H.R. ASDEX Team; NI Team; ICRH Team. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. In *ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988.* Order Number DE90780658. Available from NTIS (US Sales Only), PC A07/MF A01.

In this paper we describe experiments undertaken to evaluate the retention of target produced impurities in the ASDEX divertor. The titanium divertor plates have recently been replaced by water-cooled copper plates. Since copper is a material not previously present inside the ASDEX torus, a unique possibility existed to study the transport of the target plate material from the divertor chamber into the main plasma. By spectroscopic measurement of the Cu flux emerging from the target plate and of the Cu density in

the main plasma, the retention is assessed. We find a poor retention (R=1) for low n_e (n_e<3.0*10^{13} cm^{-3}) but a substantially improved one (R>30) at high densities. During additional heating (NI, ICRH) at the same density as in the OH case, the retention is lower, but approaches similar values at slightly higher densities. The retention seems to be independent of the heating power. (orig.).

29659 (IPP–III/139, pp. 96-107) **Measurements of the flux of metallic impurities to the ASDEX divertor plates.** Taglauer, E.; Martinelli, A.P.; Janeschitz, G. ASDEX Team. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. In *ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988.* Order Number DE90780658. Available from NTIS (US Sales Only), PC A07/MF A01.

Metal impurity (Fe, Cu) fluxes to the divertor plates of ASDEX were measured using a collector probe during discharges with various plasma parameters. The Cu deposition shows generally a different distribution across the scrape-off layer compared to the Fe deposition. The maximum Cu deposition is close to the Cu divertor plates indicating evaporation or sputtering from these plates. In the center of the SOL, Fe-fluxes are indicative of the Fe content in the central plasma. Variations of the Cu and Fe fluxes with auxiliary heating and vessel carbonisation are analysed and discussed in view of impurity production mechanisms. (orig.).

29660 (IPP–III/139, pp. 108-128) **Material transport at the vessel walls of the divertor tokamak ASDEX.** Wang Wenmin; Roth, J.; Behrisch, R.; Staudenmaier, G. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. In *ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988.* Order Number DE90780658. Available from NTIS (US Sales Only), PC A07/MF A01.

Carbon tiles and probes, which had been mounted on the vessel walls of the divertor tokamak ASDEX during different experimental periods as well as the Ti divertor plates removed in 1986 have been analysed with respect to deposition of D and metal atoms. The lowest Fe, Ni, Cr deposition (5 10^{15} cm^{-2}) was found at the area where the separatrix intersects the divertor plates, while the deposition is much larger (of the order of 10^{17} cm^{-2}) at the divertor entrance and the walls of the divertor chamber, as well as at the walls of the main discharge chamber. This indicates that metal atoms deposited at the divertor plates are re-eroded, while the final sink for plasma impurities are the walls of the divertor chamber and of the main plasma vessel. During the last operation period the plates were made from Cu and the Cu deposition on the vessel walls was found to increase with the number of discharges indicating material transport from the divertor chamber into the main plasma vessel. From the survey of metal atom deposition a material transport balance is established comparing impurity sources and sinks. (orig.).

29661 (IPP–III/139, pp. 129-144) **Plasma induced changes of a metallic divertor neutralizer plate from ASDEX analysed by photoacoustics.** Bein, B.K. (Bochum Univ. (Germany, F.R.). Inst. fuer Experimentalphysik 6 (Germany, F.R.)); Wojczak, M.; Pelzl, J. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. In *ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988.* Order Number DE90780658. Available from NTIS (US Sales Only), PC A07/MF A01.

A metallic divertor neutralizer plate of the ASDEX tokamak has been analysed by photoacoustics, a thermal wave method with acoustic detection, to obtain space resolved thermal depth profiles and to characterize the plasma-induced changes of the plate material. In the intersection region between the plasma separatrix and the neutralizer plate where the maximum power deposition occurred during incorporation in ASDEX, the effusivity $\sqrt{}$koc, the thermophysical parameter relevant for time dependent surface heating processes, increased about 18% over its original value. (orig.).

29662 (J–550-90-601/2454) **Thermal barrier research: Final technical report, September 1985–June 1986.** Moses, K.G. JAYCOR, Torrance, CA (USA). Plasma Technology Div. 7 Mar 1990. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-85ER51095. Order Number DE90009213. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The thermal barrier region in the TARA device is a complex arrangement combining ion-plugging by sloshing ions with an ECRH-generated thermal barrier plasma. An axisymmetric, high-mirror-ratio magnetic field, adjacent to the central cell, provides the confinement of the thermal barrier plasma and sloshing ions. This paper discusses research being done in this thermal barrier region.

29663 (JAERI-M–89-209) **Study of marfe phenomena on JT-60.** Nishitani, Takeo (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Ishida, Shin-ichi. Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1989. 33p. Order Number DE90777743. Available from NTIS (US Sales Only), PC A03/MF A01.

The marfe (Multifaceted Asymmetric Radiation From the Edge) is a poloidally asymmetric radiation band localized near the inside midplane and is a common phenomenon among middle and large size tokamaks like Alcator-C, ASDEX, TFTR and JET. In JT-60 marfe has been observed frequently in high-Ip and high density limited discharges with neutral beam heating. It can be explained as a radiative thermal instability caused by light impurities in a peripheral plasma. Though the marfe onset close to the density limit reduces the line averaged electron density, it does not affect the central electron temperature and the energy confinement. The marfe onset at relatively low Ip improves energy confinement time up to several % accompanied with the increase of electron density. (author).

29664 (JAERI-M–89-217) **A model of L-H transition.** Aikawa, Hiroshi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1989. 34p. Order Number DE90777756. Available from NTIS (US Sales Only), PC A03/MF A01.

A model of L-H transition in a tokamak plasma is presented. In the theory of the dissipative drift wave turbulence, the condition of $k^2\rho i^2 \simeq 1$ (k : wave vector normal to the magnetic field, ρi: ion Larmer radius evaluated by electron temperature) makes the theoretical procedures change from the fluid type to the kinetic one as $k\rho i$ grows over unity. This fact leads the diffusion coefficient induced by this instability to utterly different dependence of plasma parameters (especially electron temperature (T_e) dependence changes from $T_e^{5/6}$ to T_e^{-2} as $k^2\rho i^2$ changes from the value less than unity to the value more than unity). It is shown in the present paper that L-H transition can be induced by this change of plasma parameter dependence of the diffusion coefficient, and the threshold value of electron temperature is also presented. This model, using the radial profiles of electron density and temperature near the plasma circumference obtained by the experiment of ASDEX, shows a good explanation of L-H transition. The various characteristics of H-mode, having been obtained by the various tokamak machines with the various conditions, are discussed and also explained consistently. (author).

29665 (KAERI/RR–764/88) **Survey of fusion reactor technology start-up experiment of the KAERIT.** Kang, Hee Dong (Korea Advanced Energy Research Inst., Daeduk (Republic of Korea)); Hwang, Churl Kew; Lee, Kwang Won; In, Sang Ryul; Hwang, Soon Mo; Jung, Seung Ho; Oh, Byung Hoon; Yoon, Byung Joo; Yoon, Jae Sung. Korea Advanced Energy Research Inst., Daeduk (Republic of Korea). Dec 1988. 294p. (In Korean). Order Number DE90623624. Available from NTIS (US Sales Only), PC A13/MF A01; OSTI; INIS.

This report describes the results of a study on the hydrogen gas breakdown for plasma initiation in the KAERIT tokamak, which is an iron core device with a major radius of 27 cm and a minor radius of 5 cm. This tokamak is designed to operate in a toroidal field of 4 T, a maximum plasma current of 100 kA, plasma temperature of 1 keV, and plasma density of 5 x 10^{13} cm^{-3}. At present this device is working in a toroidal field of 0.44 T, a maximum plasma current of 10 kA with pulse duration of 1.8 msec, and a maximum plasma

temperature of 39 eV at a plasma density of 1 x 10^{13} cm^{-3}. The results of the gas breakdown experiments well exhibit the unique characteristics of toroidal discharge. The minimum breakdown voltage is as low as 3 V. It is concluded that the error component of the toroidal magnetic field and the stray fields from the scattered current sources have decisive influence on the discharge initiation. Displacement of the plasma column out of the equilibrium position, due to inadequate control of the equilibrium field, is the most positive cause of the major disruption of the plasma. Theoretical estimation of the temporal evolution of the plasma parameters and interrelation between them by the zero-dimensional calculation model interprets suitably the experimental results at least in the early phase of the current rise stage. This theoretical model can be used to predict the performance of the KAERIT tokamak following upgrade to the design specifications. (Author).

29666 (LRP–305/86) **Efficiency optimization for quasi-optical gyrotrons.** Isaak, B. (Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland)); Bondeson, A.; Tran, M.Q.; Perrenoud, A.; Alberti, S.; Muggli, P. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Aug 1989. 50p. Order Number DE90623594. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Optimization studies for resonator cavities of quasi-optical gyrotrons have been carried out. With the constraint that the RF field is limited by peak power load on the mirrors, the electronic efficiency can have a value of up to 10% higher than the confocal results by using spherical mirrors with g=1-d/R close to -1. Optimized nonspherical cavities yield similar results. When output coupling through circular slots is considered, confocal (g=0) as well as more extreme designs near the resonator stability boundary are less favorable and the optimum configurations found are spherical mirrors with g-factors of about -0.3, -0.6, and possibly -0.75. (author) 16 figs., 1 tab., 8 refs.

29667 (LRP–348/88) **Ballooning instabilities in tokamaks with sheared toroidal flows.** Cooper, W.A. (Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland)). Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). May 1988. 17p. Order Number DE90620691. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The ballooning-mode eikonal representation is applied to the linearised incompressible magnetohydrodynamic (MHD) equations in axisymmetric systems with toroidal mass flows to obtain a set of initial value partial differential equations in which the time t and the poloidal angle θ are the independent variables. To derive these equations, the eikonal function S is assumed to satisfy the usual conditions $b.\nabla S = 0$ to guarantee that the modes vary slowly along the magnetic field. In addition, to resolve the $V.\nabla$ operator acting on perturbed quantities, the eikonal must also satisfy the condition $dS/dt = 0$. This induces a Doppler shift in S. In a flux coordinate system (s,θ,ϕ) with straight magnetic field lines, we have that $S=\phi-q(s)\theta-\Omega(s)t+k(s)$, where q, Ω and k are functions only of the radial coordinate s and represent the safety factor, the plasma rotation frequency and the radial wave number, respectively. This description of the instability, however, is incompatible with normal mode solutions of the MHD equations because the wave vector ∇S becomes time dependent when the velocity shear is finite. Nevertheles, we are able to investigate the effects of sheared toroidal flows on localised ballooning instabilities because the initial value formulation does not constrain the solutions to evolve as $\exp(i\omega t)$. Fixed boundary MHD equilibria with isothermal toroidal flows that model the JET device value equations are evolved in time, periodic bursts of ballooning activity are observed which are correlated with the formation of a ballooning structure at the outside edge of the torus that becomes displaced by 2π in the extended poloidal angle domain from one burst to the next. The frequency of these bursts depends only on the velocity shear and the instability growth rates extracted from the peak values of the bursts are virtually linear. (Abstract Truncated)

29668 (LRP–349/88) **The laser, measuring instrument for plasmas.** Anderegg, F. (Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland)); Behn, R.; Paris, P.J.; Salito, S.A.; Siegrist, M.R.; Weisen, H. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Jun 1988. 62p. (In French). Order Number DE90623595. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

There are several different and in general complementary methods for the investigation of plasmas. All of them have different characteristics and properties covering a large spectrum of physical measuring techniques. Electromagnetic waves serving as 'thermometers' permit to detect the global behaviour of the plasma as well as that of the particles composing it. One of the advantages of these introspective methods is that it brings information on temporary and local conditions of the domain being interrogated. With the development of micro-wave sources and lasers after the war the principal tools of this type of plasma diagnostics are now available. In this paper the emphasis is on the lasers which are different according to the type of measurement. Their versatility in measuring plasma parameters is largely acknowledged. We illustrate the potential of measuring methods by lasers by means of the research work done at two experimental installations of CRPP. (author) 21 figs., 8 refs.

29669 (LRP–391/89) **Determination of central q and effective mass on TEXTOR based on Discrete Alfven Wave (DAW) spectrum measurements.** Descamps, P. (Ecole Royale Militaire, Brussels (Belgium). Lab. de Physique des Plasmas); Wasserhove, G. van; Koch, R.; Messiaen, A.M.; Vandenplas, P.E.; Lister, J.B.; Marmillod, Ph. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Dec 1989. 16p. Order Number DE90623596. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The use of the Discrete Alfven Wave spectrum to determine the current density profile and the effective mass density of the plasma in the TEXTOR tokamak is studied; the measurement, the validity of which is discussed, confirms independently the central $q(r=0)<1$ already obtained by polarimetry. (author) 5 figs., 1 tab., 10 refs.

29670 (LRP–395/90) **The frequency splitting of the axisymmetric magnetoacoustic wave as a current profile diagnostic.** Borg, G.G. (Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland)); Dudok de Wit, T. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Jan 1990. 20p. Order Number DE90623616. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

In the presence of finite plasma current, the axisymmetric (m=0) magnetoacoustic wave resonance exhibits a frequency splitting for finite toroidal mode number ($n \neq 0$) between oppositely directed travelling waves. Calculations are presented which demonstrate that $\Delta(1/f)$, the difference between the inverse resonance frequencies, is directly proportional to known moments of the plasma current profile and, in the limit where the radial wavenumber is much larger than the parallel wavenumber, is independent of the plasma mass density and its profile. Some aspects of the implementation of a current profile diagnostic based on the excitation of these resonances are also considered. (author) 16 refs., 6 figs., 1 tab.

29671 (PPLK-R–36) **Analysis on scrape off layer plasma in toroidal helical systems.** Itoh, K.; Nagasaki, K.; Itoh, S.-I.; Fukuyama, A. Kyoto Univ., Uji (Japan). Plasma Physics Lab. Jan 1989. 29p. Order Number DE90777723. Available from NTIS (US Sales Only), PC A03/MF A01.

Connection length of the magnetic field line to the wall in the scrape off layer (SOL) plasma is analysed in the toroidal helical systems. It is found that the connection length L has a logarythmic dependence on the distance from the outermost magnetic surface. Based on this result, we apply an analytic study on the plasma distribution in the SOL plasma. The edge temperature T_b approximately scales as $P^{0.36}$ as in the case of tokamaks, where P is the power flow to SOL region. For a given value of P, T_b is lower than that of tokamaks with similar minor radius. (author).

29672 (PPLK-R–37) **Design study of ion temperature measurement by collective Thomson scattering in Heliotron E.** Takeiri, Y. (and others); Sudo, S.; Tsukishima, T. Kyoto Univ., Uji (Japan). Plasma Physics Lab. Feb 1989. 45p. Order Number

DE90777725. Available from NTIS (US Sales Only), PC A03/MF A01.

Design study is carried out of ion temperature measurement system by collective far-infrared laser scattering, with the intention of applying it to the Heliotron E device. The measurement system consists of a D_2O laser, beam transmission optics for both incident and scattered light, and a dual homodyne detection system. Compared with the conventional systems where a heterodyne method is used for the signal detection, improvements of signal-to-noise ratio (S/N) and frequency resolution are expected in this system, because the dual homodyne method causes no deterioration of S/N by the stray light of the incident beam. We show that the S/N of the dual homodyne method is the same S/N as the so-called post detection and that the spectrum width of the laser light caused by the amplitude fluctuation gives the frequency resolution in the dual homodyne method. The scattered powers are evaluated for various operation modes of Heliotron E. It is shown that a 200 kW output power of the D_2O laser with a pulse duration longer than 1 μs is required to make the T_i measurement for neutral beam heated plasmas with n-bar$_e$ = (2.5-10) x 10^{13} cm^{-3} and T_i = (300-1200) eV. It is also shown that T_i can be determined with sufficient accuracy by means of the least square fitting of the measured spectrum to theoretical one, assuming a Maxwellian velocity distribution, provided the post detection S/N is larger than 3. For pumping the D_2O laser, two systems using TEA CO_2 laser, namely, a multi-stage amplifier system and an injection locking system are examined. They are compared in terms of compactness and frequency-stability. The accessibility to the Heliotron E device is also discussed. (author).

29673 (PPLK-R–38) **Parametric scaling studies of energy-confinement time for neutral-beam-heated Heliotron-E plasmas.** Sano, F. (and others); Takeiri, Y.; Hanatani, K. Kyoto Univ., Uji (Japan). Plasma Physics Lab. Feb 1989. 49p. Order Number DE90777732. Available from NTIS (US Sales Only), PC A03/MF A01.

Kinetic analysis of the global energy confinement time for neutral-beam-heated Heliotron-E plasmas has been performed with the 1-D, time-independent transport analysis code, PROCTR-Mod. Beam-power scans were performed by firing various number of hydrogen neutral beams, while density scans were performed by puffing gas and/or pellet fueling under the metallic or carbonized wall conditions. The wall carbonization facilitated the density increase due to the enhanced particle recycling on the walls, and also enabled long-pulse, quasi-stationary, currentless ECH + NBI operation with reduced heavy-impurity contamination. The data analysis shows that the favorable density dependence partially offsets the unfavorable power dependence, and that the anomalous electron transport loss becomes dominant in the over-all energy balance as the beam power and plasma density are increased. An alternative scaling law is also presented which is to fit $\tau_E{}^G$ [ms] by an 'offset-linear' law. The latter scaling is found to provide a better fit to the presented data sets in spite of its simple form. The parametric scaling of the local electron thermal diffusivity, χ_e, is also discussed on the basis of the kinetic analysis. (J.P.N.).

29674 (PPLK-R–40) **Scalings of energy confinement and density limit in stellarator/heliotron.** Sudo, S.; Takeiri, Y.; Zushi, H.; Sano, F.; Itoh, K.; Kondo, K.; Iiyoshi, A. Kyoto Univ., Uji (Japan). Plasma Physics Lab. Apr 1989. 31p. Order Number DE90777730. Available from NTIS (US Sales Only), PC A03/MF A01.

Empirical scaling of energy confinement observed experimentally in stellarator/heliotron (Heliotron E, Wendelstein 7A, L2, Heliotron DR) under the condition that plasmas are heated by ECH and/or Nbl is proposed. Empirical scaling of density limit obtainable under the optimum condition is proposed. These scalings are compared with those of tokamaks. The energy confinement scaling has similar power dependence as 'L mode scaling' of tokamaks. The density limit scaling seems also to indicate the upper limit of achievable density in many tokamaks. Combining the energy confinement time and the density limit scaling a transport-limited beta value is also deduced. Thus, from the viewpoint of designing a machine, there should be some compromise in determing magnetic field strength on plasma axis, average minor radius and major radius, because their dependence on confinement time and transport-limited beta value is contradicting. (J.P.N.).

29675 (PPLK-R–41) **Equilibrium, stability, and deeply trapped particle orbit calculations for l = 2 torsatron/heliotron configurations.** Nakamura, Y.; Wakatani, M.; Leboeuf, J.N.; Carreras, B.A.; Dominguez, N.; Holmes, J.A.; Lynch, V.E.; Painter, S.L.; Garcia, L. Kyoto Univ., Uji (Japan). Plasma Physics Lab. Jun 1989. 48p. Order Number DE90777729. Available from NTIS (US Sales Only), PC A03/MF A01.

Confinement properties of l = 2 torsatron/heliotron configurations with number of toroidal field periods, M, in the range 10 to 14 are studied. This involves the calculation of zero-current and flux conserving equilibria; stability against Mercier modes and low-n ideal modes, with n denoting the toroidal mode number; and orbit confinement of deeply trapped energetic particles. Optimization of both magnetohydrodynamic (MHD) and transport properties is pursued under the condition of plasma aspect ratio A = R/a $\geq$ 7, with R the major radius and a the average plasma radius. For configurations with M $\leq$ 12, an average MHD beta limit of 4 % to 5 % is possible. The addition of a quadrupole field improves the confinement of trapped particles at zero pressure, but particle losses increase with increasing beta. This loss is less severe if the vacuum magnetic axis is shifted slightly inward. A configuration with M = 10, a coil pitch parameter p_c in the range 1.25 to 1.30, and an added quadrupole field satisfies the beta and energetic particle confinement requirements for the next generation of large torsatron/heliotron devices. (author).

29676 (PPLK-R–44) **Third harmonic electron cyclotron heating of overdense plasmas in Heliotron DR.** Yanagi, N. (and others); Sato, M.; Morimoto, S. Kyoto Univ., Uji (Japan). Plasma Physics Lab. Jul 1989. 47p. Order Number DE90777726. Available from NTIS (US Sales Only), PC A03/MF A01.

Third harmonic electron cyclotron heating has been experimentally studied in Heliotron DR (R = 90cm, a-bar$_p$ $\simeq$ 7cm) by using a 28GHz, 200kW gyrotron. When the line averaged electron density, n-bar$_e$, exceeds a certain critical value of $n_{e,crit} \approx 0.5 \times 10^{13}/cm^3$, absorption power rapidly increases, and plasmas are substantially heated as long as the third harmonic resonant layers locate within the last closed magnetic surface. On the other hand, heating of the bulk plasma is not effective at the lower density of n-bar$_e$ < $n_{e,crit}$ although strong hard X-ray is radiated which suggests the generation of high energy electrons. In the high density regime, we observed that the central region of plasma is heated even when the electron density exceeds much higher than the cut-off value of O-mode (overdense plasma) almost independent of the location of resonant layers. We have found that the overdense plasma produced by the third harmonic heating have basically the same characteristics as those observed in the second harmonic heating. Electron Bernstein wave is considered to be concerned with the heating of overdense plasma in the third harmonic condition. (author).

29677 (PPPL–2674) **High-β operation and MHD [magnetohydrodynamic] activity on TFTR.** McGuire, K. Princeton Univ., NJ (USA). Plasma Physics Lab. Apr 1990. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. (CONF-891106–11: 31. annual meeting of the Division of Plasma Physics of the American Physical Society, Anaheim, CA (USA), 13-17 Nov 1989). Order Number DE90008199. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Magnetohydrodynamic (MHD) activity within three zones (core, half- radius, and edge) of TFTR [Plasma Physics and Controlled Nuclear Fusion Research (1986), (IAEA, Vienna, 1987), Vol. 1, P. 51] tokamak plasmas are discussed. Near the core of the plasma column, sawteeth are often observed. Two types of sawteeth are studied in detail: one with complete, and the other with incomplete magnetic reconnection. Their characteristics are determined by the shape of the q profile. Near the half-radius the m/n = 3/2 and 2/1 resistive ballooning modes are found to correlate with a beta collapse. The pressure and the pressure gradient at the mode rational surface are found to play an important role in stability. MHD activity is also studied at the plasma edge during limiter H-modes. The Edge Localized Mode (ELMs) are found to have a precursor mode

with a frequency between 50–200 kHz and a mode number m/n = 1/0. The mode does not show a ballooning structure. While these instabilities have been studied on many other machines, on TFTR the studies have been extended to high pressure (plasma pressure greater than 4×10^5 Pa) and low collisionality. 16 refs., 3 tabs.

29678 (PPPL–2686) **Loss of alpha-like MeV fusion products from TFTR.** Zweben, S.J.; Boivin, R.L.; Diesso, M.; Hayes, S.E.; Hendel, H.W.; Park, H.; Strachan, J.D. Princeton Univ., NJ (USA). Plasma Physics Lab. Mar 1990. 72p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE90008193. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

A detailed comparison between the observed and expected loss of alpha-like MeV fusion products in TFTR is presented. The D-D fusion products (mainly the 1 MeV triton) were measured with an 2-D imaging scintillation detector. The expected first-orbit loss was calculated with a simple Lorentz orbit code. In almost all cases the measured loss was consistent with the expected first-orbit loss model. Exceptions are noted for small major radius plasmas and during strong MHD activity. 37 refs., 28 figs.

29679 (Rijnhuizen-report–89-181) **FOM-Rijnhuizen contributions to 16th European conference on controlled fusion and plasma physics, Venice, March 13-17, 1989.** Euratom-FOM-NWO Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Mar 1989. 51p. (CONF-890302–: 16. European conference on controlled fusion and plasma physics, Venice (Italy), 13-17 Mar 1989). Order Number DE90623580. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

This report contains 9 conference contrubutions which are all in INIS scope, entitles respectively: A method for local transport analysis in tokamaks; Expansions of the flux and the current density in toroidal systems; Density fluctuation measurements in the TORTUR tokamak; A time-of-flight spectrometer for detection of low energetic hydrogen atoms; The observation of non-thermal features by tangential Thomson scattering at the TORTUR tokamak; ECRH as a research tool on RTP; Current drive by electron cyclotron waves in NET; Current density profile control by electron cyclotron current drive in NET; (H.W.). 56 refs.; 32 figs.; 18 schemes; 3 tabs.

29680 (Rijnhuizen-report–89-181, pp. 1-6) **A method for local transport analysis in tokamaks with error calculation.** Hogeweij, G.M.D. (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica); Lopes Cardoze, N.J.; Hordosy, G. Euratom-FOM-NWO Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Mar 1989. (CONF-890302–: 16. European conference on controlled fusion and plasma physics, Venice (Italy), 13-17 Mar 1989). In *FOM-Rijnhuizen contributions to 16th European conference on controlled fusion and plasma physics, Venice, March 13-17, 1989.* Order Number DE90623580. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

A new method to solve the equation for the heat transport in a tokamak is presented which expresses the local heat resistivity $\rho(r)$ as a cosine series. The coefficients of this series are given as linear combinations of the Fourier coefficients of the measured temperature-and q-profiles, where q is the heat flux per unit area. This formulation allows the stable and accurate calculation of the ρ-profile, and the analytical calculation of the error in this profile. (author). 5 refs.; 3 figs.; 10 schemes.

29681 (Rijnhuizen-report–89-181, pp. 28-33) **ECRH as a research tool on RTP.** Polman, R.W. (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica); Smits, F.M.A.; Manintveld, P.; Oomens, A.A.M.; Schueller, F.C.; Verhoeven, A.G.A. Euratom-FOM-NWO Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Mar 1989. (CONF-890302–: 16. European conference on controlled fusion and plasma physics, Venice (Italy), 13-17 Mar 1989). In *FOM-Rijnhuizen contributions to 16th European conference on controlled fusion and plasma physics, Venice, March 13-17, 1989.* Order Number DE90623580. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

The new Rijnhuizen Tokamak Project (RTP) is dedicated to studies of transport mechanisms in fusion relevant tokamak plasmas. The former Grenoble tokamak PETULA has been adapted to these studies. A 60 GHZ, 600 kW Electron Cyclotron Resonance Heating system, that will be used for strong Auxiliary heating, es described in this report. (H.W.). 7 refs.; 5 figs.

29682 (Rijnhuizen-report–89-181, pp. 34-39) **Collective scattering from 60 GHZ ECRF waves at RTP.** Kim, S.K. (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica); Hugenholtz, C.A.J.; Donne, A.J.H.; Peebles, W.A.; Luhmann, N.C. Jr. Euratom-FOM-NWO Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Mar 1989. (CONF-890302–: 16. European conference on controlled fusion and plasma physics, Venice (Italy), 13-17 Mar 1989). In *FOM-Rijnhuizen contributions to 16th European conference on controlled fusion and plasma physics, Venice, March 13-17, 1989.* Order Number DE90623580. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

In this paper the feasibility is discussed of collective Thomson-scattering measurements of various (fully or partially) electrostatic waves involved in Electron Cyclotron Resonance Heating (ECRH). utilizing radiation sources in the infrared or far-infrared region. The information thsu obtained will help understand the physics mechanism(s) of the heating process with ECRF waves. (author). 6 refs.; 3 figs.

29683 (Rijnhuizen-report–89-181, pp. 40-45) **Current drive by electron cyclotron waves in NET.** Giruzzi, G. (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica); Schep, T.J.; Westerhof, E. Euratom-FOM-NWO Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Mar 1989. (CONF-890302–: 16. European conference on controlled fusion and plasma physics, Venice (Italy), 13-17 Mar 1989). In *FOM-Rijnhuizen contributions to 16th European conference on controlled fusion and plasma physics, Venice, March 13-17, 1989.* Order Number DE90623580. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

A potentially attractive scenario for steady-state operations in the Next European Torus relies on the use of lower-hybrid (LH) waves for non-inductive current drive in the plasma periphery and of electron cyclotron (EC) waves in the aim of determining the best options for the ECN current drive system and of evaluating the expected current drive efficiency. (author). 7 refs.; 6 figs.; 1 tab.

29684 (Rijnhuizen-report–89-181, pp. 12-16) **Density fluctuation measurements in the TORTUR tokamak.** Remkes, G.J.J. (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica); Barth, C.J.; Groot, B. de; Kim, S.K.; Kluiver, H. de; Laan, H.A. van der; Donne, A.J.H. Euratom-FOM-NWO Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Mar 1989. (CONF-890302–: 16. European conference on controlled fusion and plasma physics, Venice (Italy), 13-17 Mar 1989). In *FOM-Rijnhuizen contributions to 16th European conference on controlled fusion and plasma physics, Venice, March 13-17, 1989.* Order Number DE90623580. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

A method is described for measurement of density fluctuations due to plasma turbulence in the TORTUR tokamak. (author). 3 refs.; 5 figs.

29685 (Rijnhuizen-report–89-181, pp. 17-21) **A time-of-flight spectrometer for detection of low energetic hydrogen atoms.** Toledo, W. van (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica); Bree, A.R. de; Buuren, R. van; Kluiver, H. de; Donne, A.J.H. Euratom-FOM-NWO Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Mar 1989. (CONF-890302–: 16. European conference on controlled fusion and plasma physics, Venice (Italy), 13-17 Mar 1989). In *FOM-Rijnhuizen contributions to 16th European conference on controlled fusion and plasma physics, Venice, March 13-17, 1989.* Order Number DE90623580. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

This paper is concerned with a time-of-flight method that requires direct detection of low-energetic neutral hydrogen atoms that are released from wall and limiters of a tokamak, and is able to detect hydrogen or deuterium atoms with an energy down to 10 eV. (author). 6 refs.; 4 figs.

29686 (Rijnhuizen-report–89-181, pp. 22-27) **The observation of non-thermal features by tangential Thomson scattering at the TORTUR tokamak.** Lammeren, A.C.A.P. van (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica); Barth, C.J.; Donne, A.J.H.; Est, Q.C. van; Verhaag, G.C.H.M. Euratom-FOM-NWO Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Mar 1989. (CONF-890302–: 16. European conference on controlled fusion and plasma physics, Venice (Italy), 13-17 Mar 1989). In *FOM-Rijnhuizen contributions to 16th European conference on controlled fusion and plasma physics, Venice, March 13-17, 1989.* Order Number DE90623580. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

Tangential Thomson scattering at TORTUR plasmas was set-up to determine the local current density. The results demonstrate that the velocitiy distribution of mildly turbulent plasmas in non-Maxwellian, which is of great importance for transport computations. A complete tangential spectrum has been measured by a single laser pulse. (author). 10 refs.; 4 figs.

29687 (Rijnhuizen-report–89-181, pp. 7-11) **Expansions of the flux and the current density in toroidal systems.** Milligen, B.P. (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica). Euratom-FOM-NWO Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Mar 1989. (CONF-890302–: 16. European conference on controlled fusion and plasma physics, Venice (Italy), 13-17 Mar 1989). In *FOM-Rijnhuizen contributions to 16th European conference on controlled fusion and plasma physics, Venice, March 13-17, 1989.* Order Number DE90623580. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

The magnetic equilibrium in tokamaks is described by the Grad-Shafranov (GS) equation. The flux function is expanded in a set of solutions of the homogeneous GS equation. The expansion coefficients, called multipolar moments, are however not simply related to physically more meaningful global plasma parameters. Current moments, on the other hand, are widely used to obtain such global plasma parameters. In this paper a method is presented for obtaining relationships between multipolar and current moment. (author). 6 refs.; 1 fig.; 6 schemes; 1 tab.

29688 (Rijnhuizen-report–89-181, pp. 46-51) **Current drive density profile controle by electron cyclotron current drive in NET.** Giruzzi, G. (Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica); Shep, T.J.; Westerhof, E. Euratom-FOM-NWO Collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. Mar 1989. (CONF-890302–: 16. European conference on controlled fusion and plasma physics, Venice (Italy), 13-17 Mar 1989). In *FOM-Rijnhuizen contributions to 16th European conference on controlled fusion and plasma physics, Venice, March 13-17, 1989.* Order Number DE90623580. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

The possibility of current density profile control in NET (Next European Torus) with ECCD (Electron Cyclotron Current Drive) is investigated. As an example profile control around the q=2 surface is studied. This is of particular interest, as the m=2, n=1 tearing mode, which is driven unstable by the current gradient inside the q=2 surface, is a major cause of disruptions. (author). 6 refs.; 2 figs.; 2 schemes; 1 tab.

29689 (Rijnhuizen-report–89-185) **Fundamentals of collective scattering experiments.** Remkes, G.J.J. Euratom-FOM-NWO collaboration. Associatie Euratom-FOM, Nieuwegein (Netherlands). FOM-Instituut voor Plasmafysica. May 1989. 53p. Available from Library KNAW; P.O.Box 41950, 1009 DD, Amsterdam, Netherlands.

Includes list of symbols.

Aspects of collective scattering of mm and sub-mm radiation on density fluctuations in laboratory plasmas have been described. The fluctuation level at a value of the density wave vector k has been expressed in terms of observable quantities, the k-resolution and the scattering volume which in turn have been expressed in terms of beam parameters. This yielded an expression for the fluctuations at k in terms of observable quantities and beam parameters valid for microwave scattering. The total fluctuation level has been found from a summation of the fluctuation levels at different k. This has been done for the cases of spherical isotropy and of isotropy is the poloidal plane. Expressions have been derived for the minimum source power needed in scattering experiments. It has been done for a one-channel detection system without transmission losses and for a multi-channel system with transmission losses. The derivations have been extended, to include the effect of the presence of plasma radiation. All derivations and calculations have been performed for heterodyne detection and for balanced mixing systems. It was found that the values of the minimum required source power are comparable for both methods of detection. Furthermore the minimum source power increases with decreasing wavelength and depending on the applied wavelength. Plasma radiation can considerably effect the minimum source power needed. For tokamaks with B = 3T the source wavelength must be smaller than 1 mm because of the electron cyclotron emission. Thereforemolecular lasers are recommended for a source. A homodyne one-channel balanced mixing system used on TORTUR has been treated. It was found that with the available 65 mW klystron a fluctuation level of 10^{-3} can be observed. This is a value considerably smaller than the fluctuations expected from the mixing length argument in turbulent transport theories. 17 refs.; 14 figs.; 144 schemes; 7 tabs.

29690 **A cw dye laser system for Li beam spectroscopy in a tokamak.** West, W.P. (GA Technologies, Inc., Oak Ridge, TN (USA)); Thomas, D.M. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) ([1990]). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The current density profile diagnostic employs a cw dye laser system to induce fluorescence in a Li beam injected into a tokamak. This laser has spectral and polarization modulation requirements not available in commercial systems. The required spectrum is a bandwidth of approximately 5 GHz at a wavelength of 667 nm. The bandwidth of the laser needs to be filled in as nearly as possible, i.e., a quasi-continuum within the 5 Ghz bandwidth. The polarization of the laser must remain linear, but the plane of polarization must be rotated at a high frequency, ~ 50 kHz. The details of the Li atomic spectroscopy in a tokamak and the requirements of the diagnostic system that lead to these requirements are addressed. The laser system and polarization modulator which have been developed are discussed in detail, including both design and performance parameters. Possible improvements to enhance performance are also discussed.

29691 **ECHR absorption and propagation studies via collective Thomas scattering.** Peebles, W.A. (California Univ., Berkeley, CA (USA)); Kim, Luhmann, N.C., Jr.; Zimmerman, P. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Electron cyclotron resonance heating ECRH has made rapid progress over the last few years due primarily to improved gyrotron source technology. The unique ability of ECRH to deposit energy locally offers numerous advantages such as the ability to preionize, initiate, control and heat fusion plasmas. However, wave propagation and absorption mechanisms are not well understood and the fusion community could benefit from a nonperturbing monitor of ECRF wave activity. The use of FIR collective Thomson scattering techniques on the upcoming ECRH experiment on TEXT is described. The intention is to probe both $k_{\parallel}$ and $k_{\perp}$ ECRF wave activity as well as simultaneously monitoring microturbulence levels. The existing source frequency of 245 GHz will experience a large frequency shift (~60 GHz) after scattering from ECRF waves. This has a number of important consequences for the accurate interpretation of scattering data. These are described in detail, as are alternative CO_2 and FIR laser scattering schemes.

29692 **Electron cyclotron measurements with the fast scanning heterdyne radiometer on the tokamak fusion test reactor.** Taylor, G, (Princeton Univ., NJ (USA)); Efthimion, P.C.; McCarthy,

M.P.; Fredd, E.A.; Cutler, R.C. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Three fast scanning heterodyne receivers, swept between 75-110 GHz, 110-170 GHz, and 170-210 GHz, have measured electron cyclotron emission on the horizontal midplane of the tokamak fusion test reactor (TFTR) plasma. A second harmonic microwave mixer in the 170-210 GHz receiver allows the use of a 75-110 GHz backward wave oscillator as a swept local oscillator. Electron temperature profile evolution data with a time resolution of 2 msec and a profile acquisition rate of 250 Hz are presented for gas-fuelled and pellet-fuelled ohmic and neutral beam heated plasmas with toroidal fields up to 5.2 tesla. Recent results from a swept mode absolute calibration technique which can improve the accuracy and data collection efficiency during in-situ calibration are also presented.

29693 Optically thin perpendicular electron-cyclotron emission from hot electrons in TMX-U. James, R.A. (Lawrence Livermore National Lab., CA (USA)); Lasnier, C.J.; Ellis, R.F. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report perpendicular electron-cyclotron emission (PECE) from relativistic (T_H~100 to 400 keV) hot electrons within the thermal-barrier region of TMX-U detected at 60 GHz and 94 GHz. For the operating regime of TMX-U these signals are optically thin and therefore proportional to the hot electron radial line density. These signals are used in determining the temporal evolution of the hot electron density, n_H, and temperature, T_H, in combination with a relativistic code to calculate the temperature dependence of the respective perpendicular emission coefficients. This dependence has been experimentally verified by x-ray measurements of T_H. Due to an inability to absolutely calibrate the present PECE optical system, T_H is cross-calibrate with x-ray measurements and n_H is normalized to diamagnetic loop measurements.

29694 Data structures for the description of tokamak diagnostics. Hertweck, F. (IPP Gorching (US)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The data acquisition system for the ASDEX-upgrade experiment is a distributed system, consisting of about 30 autonomous diagnostic subsystems (ADS), typically a micro VAX or similar running with UNIX, a central data analysis system (CDAS), on an IBM 4381 main frame with one CPU and at least 16 Mytes of memory, and a fiber glass connection network, permitting a transfer rate of at least 100 Kytes/sec from each ADS, and a total through-put of at least I Mytes/sec. The author reports on an open-ended file structure designed to describe shot-files. For each entity, like a CAMAC device, the diagnostic descriptor, a signal or a signal group, a time base, etc., an object descriptor exists in the file that permits the automatic collection of CAMAC data by an ACQUIRE task: a list of these objects, together with a mapping function, specifies how signals are constructed from the contents of CAMAC memories. The shot file thus constructed for each diagnostic on its ADS is sent to the CDAS where all data are spread out in memory. The shot file structure is complemented with a set of access procedures (usable by FORTRAN77 programs) that permit access to a shotfile (also older ones), to individual diagnostics of it, and their signals by using the appropriate symbolic names.

29695 Physics analysis database for the DIII-D tokamak. Schissel, D.P. (GA Technologies, Inc., Oak Ridge, TN (USA)); Bramson, G.; DeBoo, J.C. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report on a centralized database for handling reduced data for physics analysis implemented for the DIII-D tokamak. Each database record corresponds to a specific snapshot in time for a selected discharge. Features of the database environment include automatic updating, data integrity checks, and data traceability. Reduced data from each diagnostic comprises a dedicated data bank (a subset of the database) with quality assurance provided by a physicist. These data banks will be used to create profile banks which will be input to a transport code to create a transport bank. Access to the database is initially through FORTRAN programs. One user interface, PLOTN, is a command driven program to select and display data subsets. Another user interface, PROF, compares and displays profiles. The database is implemented on a Digital Equipment Corporation VAX 8600 running VMS.

29696 The development of a plasma fluctuation diagnostic software tool. Hong, J.Y. (Intelligent Signal Processing, Austin, TX (USA)); Powers, E.J.; Ritz, C.P. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper describes a software package that will ultimately be made available to the magnetic fusion energy community and which may be used to analyze and interpret linear and nonlinear fluctuation data generated by a wide variety of plasma diagnostics such as, for example, probes, scattering systems, and beams. The software tool is divided into two basic parts: mathematical/statistical programs will be further subdivided into those suitable for stationary and nonstationary data. The stationary data package will include bispectral analysis, a very powerful tool in the analysis of nonlinear data. Application programs will include fluctuation-induced particle transport, two-point estimates of S(k,w), three-wave coupling coefficients and energy cascading, and nonlinear digital filters.

29697 A probabilistic model for x-ray PHA data. Diesso, M. (Princeton Univ., NJ (USA)); Hill, K. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

In this paper, a mathematical model of the data produced by a single-arm x-ray pulse height analyzer (PHA) system is developed. Given an assumption on the electron temperature and density profiles, a maximum likelihood technique is applied to calculate the peak electron temperature and enhancement factor of the plasma. This method is currently being used in the analysis of x-ray data from the tokamak fusion test reactor (TFTR); sample results are presented.

29698 Experiences with delta compression of data produced by DIII. Henline, P.A. (GA Technologies, Inc., Oak Ridge, TN (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The requirements for the amount of data to be collected for each tokamak shot is rapidly increasing. This is caused by many factors, including more diagnostic experiments to put on a machine, lowering cost of electronics hardware (especially memory), and longer plasma current duration. The design goal for the DIII-D tokamak is 25 Mbytes of data per shot. In order to store the shot as one logical unit, the delta compression algorithm, is being used. Statistics on compression factors, times, and general usage are presented for actual DIII data. Data for 8, 10, and 12-bit digitizers are highlighted since this hardware is common to most sites.

29699 Magnetic-fusion data analysis at Los Alamos. Klare, K.A. (Los Alamos National Lab., NM (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The author reports on DAD, a versatile easy-to-use, easy-to-modify set of programs for data analysis and display. The physicist calls a program by its name and a few numbers, which will tell the device, shot, or operation needed. Each command invokes a separately compiled program. This allows each experimenter to write commands to display model calculations or special devices. A common set of displays include: raw and normalized signals, Thomson scattering nonlinear fits, thermocouple conversions, ion temperatures, and angles of phase-modulated signals. Multiple-device and multiple-shot displays of single-channel or quadrature signals show progressions otherwise hard to find. Some programs have three-dimensional displays with contour or surface plots. The shots available and device characteristics can be listed; analysis parameters may be shown or set. Other programs arm, trigger, or read acquisition devices. One number can define a whole series of commands. These programs use a shared library on Prime and VAX computers.

29700 The CHERS software system: A MicroVAX-based diagnostic. Lagin, L. (Princeton Univ., NJ (USA)); Arnold, N.; Davis, W.; Fonck, R.; Jaehnig, K.; Christianson, G.; Schneider, U. pp. 12 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The CHERS (charge exchange recombination spectroscopy) diagnostic is the first TFTR diagnostic to utilize a microVAX II computer for device control, data acquisition, analysis, and event-driven processing. The CHERS software system is described in this paper. It is based on a primary interactive menu-driven task, enabling the diagnostic physicist to perform interactive device control and monitoring, and calibration and control file editing, and to control automatic device setup, data acquisition, and analysis. All software is written in FORTRAN. Device control was accomplished using ORNL VAX CAMAC and RTIPS (Real time image processing system) FORTRAN subroutines. Standard VAX system services are utilized, including the use of event flags, global sections, logical names, AST's (Asynchronous System Traps), security services, and subprocess spawning.

29701 The PLT data acquisition and analysis system. Murphy, J.A.; Gibney, T.R. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The data acquisition and analysis system for PLT is discussed in this paper. It is being moved from a KL-10 to a VAX 11/785. Most of the major diagnostics are currently running on the VAX, with approximately one Mbyte of data being taken each shot. The system uses the MIT Model Data System (MDS) for acquisition and archival of data and the PPPL Event Control System (ECS) for scheduling. The analysis programs use the MDS data retrieval subroutines which deliver correctly calibrated results to the user program.

29702 Data acquisition and display in space plasma physics. Williams, D.J. (Johns Hopkins Univ., Laurel, MD (USA). Applied Physics Lab.). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Studies of the behavior of space plasmas and their interactions require the acquisition and display of voluminous amounts of data: The basic data set required consists of ac and dc magnetic and electric fields and the three dimensional distribution functions for ions and electrons. The frequency, energy, and intensity ranges for these data span many decades and present a challenge to the observer to identify and understand the systematics of the data set as a whole. The data are used to characterize the plasmas encountered and their dependence on both external and internal parameters. This requires data displays which encompass long time intervals and which allow one to distinguish readily between various plasma regimes. The data also are used to study the micro-physics of the ambient plasmas and their interactions. Here displays are required to show details of the spatial and temporal evolution of the data set over short time periods. The authors present and discuss several techniques used in space plasma physics to display these large amounts of data for effective and efficient analysis and study.

29703 The use of positrons to study transport in tokamak plasmas. Surko, C.M. (AT and T Bell Labs., Murray Hill, NJ (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

It now appears to be feasible to deposit positrons (e^+) in a tokamak plasma by injecting bursts of neutral positronium atoms ($e^+ e^-$), which are then ionized by the plasma. The annihilation time of these positrons in the plasma is long compared with typical particle containment times. Thus, the subsequent transport of the positrons can then be studied by monitoring the time dependence of the annihilation, gamma radiation produced when the positrons strike a limiter. For example, by varying the initial positron deposition profile in the plasma, information about the spatial dependence of the diffusion and convection of these electron-mass charged particles can be obtained. The author discusses the design of such an experiment (including a positron trap capable of producing a single-component positron plasma), the kinds of data which can be obtained, and the physics questions which this experiment might address. This diagnostic technique could also be useful for studying transport in other magnetic confinement devices such as mirrors and reversed-field pinches.

29704 Use of the Kalman filter in signal processing to reduce beam requirements for alpha-particle diagnostics. Cooper, W.S. (Lawrence Livermore National Lab., CA (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract AC03-76SF00098. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Several techniques proposed for diagnosing the velocity distribution of fast alpha-particles in a burning plasma require the injection of a beam of fast neutral atoms as probes. The author discusses how improving signal detection techniques is a high leverage factor in reducing the cost of the diagnostic beam. Optimal estimation theory provides a computational algorithm, the Kalman filter, that can optimally estimate the amplitude of a signal with arbitrary (but known) time dependence in the presence of noise. In one example presented, based on a square-wave signal and assumed noise levels, the Kalman filter achieves an enhancement of signal detection efficiency of about a factor of 10 (as compared with the straightforward observation of the signal superimposed on noise) with an observation time of 100 signal periods.

29705 Backward compton scattering for probing electric fields in a plasma. Joshi, C. (California Univ., Los Angeles, CA (USA)); Clayton, C.E. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). Grant ECS-83-10972. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

A new method is suggested for probing ultra high electric fields associated with relativistic plasma waves in high density plasmas. A relativistic electron beam and an intense photon beam are collided inside the plasma. In the absence of any perturbing fields, the electrons Compton scatter some of the photons. In the backward direction, the frequency of the scattered radiation is roughly $4\gamma^2\omega_0$ with a frequency spread of $\sim 2\Delta\gamma/\gamma$). When strong electric fields are present, some of the electrons are accelerated and others are decelerated. This leads to broadening of the Compton scattered spectrum. An experiment designed to probe coherent longitudinal electric fields of a beat excited plasma wave is described.

29706 Barium ion beam magnetic field and space potential diagnostic. Wickham, M. (TRW Physical Sciences Center (US)); Higgins, L.; Lazar, N.H.; Dandl, R. pp. 92 of Proceedings of the 6th

topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Improvements have been made in a barium ion beam magnetic and space potential diagnostic to increase the signal to noise ratio which have made measurements in the STM hydrogen plasma possible. These improvements include larger solid angle collection optics, higher delivered laser power and higher ion beam densities. Radial profiles of magnetic field, space potential and potential fluctuations are presented for various operating conditions of the STM device. Application of this diagnostic to other plasma devices is presented.

29707 Simultaneous measurements of radial and poloidal wavenumbers using a heavy ion beam probe. Connor, K.A. (Rensselaer Polytechnic Inst., Troy, NY (USA)); Crowley, T.P. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Experimental studies of density, temperature, or potential fluctuations have been limited by the inability of the available diagnostics to determine radial and poloidal wavenumbers at the same plasma location. Laser scattering, for example, is only sensitive to the wavenumber perpendicular to the beam. Heavy ion beam probes obtain wave number information by observing two nearby locations along the beam (with two detectors) and thus are only sensitive to the wavenumber parallel to the beam. The authors report a technique under investigation that can permit the beam probe to determine both components of the wavenumber by adding a rapid, small amplitude, square wave sweep voltage modulation that moves the measurement point between two points displaced slightly from the beam axis. With four measurement points displaced along and perpendicular to the beam, k can be determined for fluctuation frequencies limited only by the beam sweep modulation and detector electronics.

29708 TEXT heavy ion beam probe. Schoch, P.M. (Rensselaer Polytechnic Inst., Troy, NY (USA)); Forster, J.C.; Jennings, W.C.; Hickok, R.L. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report on the 500 keV TEXT heavy ion beam probe, now on line. Very good signal to noise ratio has been observed during the initial operating phase. The large size and high operating energy presented some developmental problems that had not been encountered with previous beam probe systems. A 74% electrostatic beam bending system was required to direct the beam to the proper injection angle. Dual quadrupole lenses were installed to compensate for the distortion of the bending system. In order to reduce the size, the parallel plate energy analyzer is operated at a field of 10 kV/cm. The possibility of severe field distortion by UV produced photo electron current was minimized by careful baffling and the use of a parallel wire top plate. The 8 r.f. type power supplies used to drive the system can introduce coherent ripples that had to be suppressed. Experimental evidence for the existence and the suppression of these characteristics is presented.

29709 Heavy Ion beam probe diagnostic system for ATF. Carnevali, A. (Rensselaer Polytechnic Inst., Troy, NY (USA)); Misium, J.; Lewis, J.F.; Connor, K.A. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The potential structure in non-axisymmetric toroidal confinement devices is largely responsible for the particle drift surfaces. A heavy ion beam probe diagnostic, which can directly determine the potential, is thus planned for ATF. The most significant device characteristics affecting the implementation of such a system on this complex magnetic geometry that were not encountered on tokamaks are the large toroidal separation (15 degrees) of vertical and horizontal ports and substantial magnetic return fields in the region of the ion optics and energy analyzer electric fields. The status of the design is presented with particular emphasis on the choice of energy analyzer required by the large dispersion in ion trajectories produced by this field.

29710 Highly doped ruby filters for stray light reduction in Scatpak II. Thomas, E.E. (Georgia Inst. of Tech., Atlanta, GA (USA). Fusion Research Center); Kindsfather, R.R. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

A ruby crystal with doping of 1% Cr_2O_3(by weight), was grown, cut, polished and anti-reflection (AR) coated to produce high through-put filters for reducing the stray light in ruby-laser scattering experiments. These filters have a transmission better than 99% for wavelengths longer than 7000 Å with the polarization perpendicular to the c-axis. Procurement specifications and performance are presented. Performance of the filters is compared with existing theoretical work. The 4 mm thick filters attenuate stray light perpendicular to the c-axis by a factor of 9, and perform well in scattering experiments on the red side of the spectrum.

29711 Thomson scattering in the Tara tandem mirror central cell. Casey, J.A. (Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center); Irby, J.H. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report on a Thomson scattering experiment under construction for the central cell of the Tara tandem mirror. This experiment has been designed to measure electron temperature and density at densities down to $3 \times 10^{11} cm^{-3}$. The measurement is made at a single time-point per shot using a holobeam 10 J Q-switched ruby laser, folded back for two passes through the scattering volume. Detection is at 90 degrees with f5 optics. The optical table is mounted on linear bearings with a 10 inch stroke, so that the radius of the scattering volume may be changed from shot to shot. Features of the experiment include a high-throughput (>25%) commercial triple-grating polychrometer using holo-graphic gratings, and a directly coupled ten channel micro-channel plate photo-detector array.

29712 The TFTR edge Thomson scattering system. Grek, B. (Princeton Univ., NJ (USA)); Dimock, D.; Johnson, D.; Palladino, R.; Tolnas, E. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report on a system under construction which will provide measurements of TFTR plasma edge profiles of electron temperature and density. The edge diagnostic would make use of many of the components of the full profile systems now installed-the laser, the collection optics, the calibration and alignment hardware. It would sample signal from three adjacent fiber optic bundles of one of the two existing 76 bundle systems and send it to a spectrometer and detector which are optimized for low density, low temperature conditions. The choice of sampled positions is scannable from the inner wall to the outer wall at the horizontal midplane. Optically, the system will be able to resolve the resulting 10 cm profile into 20 spatial points and 20 spectral channels. The detector consists of a CCD intensified with an 18 mm third generation intensifier. Minimum detectable temperatures will range from 5 ev at the inner edge to 10 ev at the outer edge. With efficient background suppression the minimum density will be $5 \times 10^{11}/cm^{-3}$.

29713 Feasability study of using the TFTR Thomson scattering system for q profile measurements. Brizard, A. (Princeton Univ., NJ (USA)); Grewk, B.; Johnson, D.; LeBlanc, B. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on

high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The results of a study made to determine the possibility of using the TFTR 76 channels Thomson scattering system to measure the direction of local magnetic fields in a tokamak plasma are presented. As this is a local measurement, this technique can in principle yield q profiles without the need of any de-convolution. The effect of the TFTR geometrical configuration and its various components on the expected measurement accuracy is discussed. The authors find that the measurement of q values within the inner half of the plasma should be possible, with only minor modification to the present TVTS system.

29714 Design concepts for compact mass/energy charge exchange analyzers. Roquemore, A.L. (Princeton Univ., NJ (USA)); Medely, S.S. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Charge exchange diagnostics in a hostile neutron and gamma radiation environment require substantial shielding against radiation-induced noise signal. Minimizing the dimensions of the apparatus significantly reduces the shielding complexity. Conceptual designs for compact analyzers are presented. The reduced size is achieved primarily by employing high field strength (> 8 kGauss) permanent rare earth magnets to simplify magnetic field generation.

29715 Diagnostics for space and time resolved ion temperature measurements in the STRO-M tokamak. Van Heesch, E.J.M. (Regina Univ., SK (Canada)); Hirose, A.; Sarkissian, A.; Skarsgard, H. M. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The energy spectrum of fast helium neutrals scattered off plasma ions is a rather straight forward measure of the ion temperature. An outline is given of the experimental technique to apply this scattering method on STOR-M. The authors compare it with charge-exchange measurements using the same apparatus. The expected accuracy of the scattering technique is 10% with a time resolution of 40 μs and a radial resolution of 1 cm. The advantages of the technique originate from the relatively high energy range in which it operates. (The scattered spectrum lies just below the incident beam energy.) Therefore the scattered neutrals escape from the plasma with little attenuation and are easily distinguished from thermal neutrals. The use of helium instead of hydrogen improves the count rate considerably and decrease the number of slowing down beam neutrals.

29716 Plasma measurements with the TMX-U E||B end-loss ion spectrometers. Foote, J.H. (Lawrence Livermore National Lab., CA (USA)); Wood, B.E.; Brown, M.D.; Curnow, G.M. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report two E||B end-loss-ion spectrometers (ELIS) nowmaking plasma measurements on TMX-U. One instrument is mounted on each end of this open-ended tandem-mirror machine. These spectrometers observe plasma losses along magnetic-field lines. They operate reliably and with a minimum of attention during an experimental run. Their data, which are quickly acquired and analyzed, help guide the experimental sequence. The parallel electric and magnetic fields separate the end-loss ions according to mass (D^+ and H^+) and energy. Each spectrometer detects ions with an array of 128 flat collector plates, made from copper-coated G10 epoxy fiberglass, normally used for printed-circuit boards. The ELIS diagnostic system produces a wealth of experimental information, including data on peak plasma potential, central-cell ion temperature, potentials in the thermal-barrier region, axial confinement and ion-end-loss plugging, energetic-electron losses, and H/D concentrations.

29717 Determining plasma fueling sources with an end-loss ion spectrometers. Grubb, D.P. (Lawrence Livermore National Lab., CA (USA)); Foote, J.H. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report their use of a mass-sensitive, E||B, end-loss ion spectrometer (ELIS) mounted near the center line of TMX-U to help identify the major sources of fueling gas. They set the electric field in the ELIS to simultaneously measure the axial loss currents of both hydrogen and deuterium. They then initiated plasma discharges where we injected either hydrogen or deuterium gas into the central-cell. They also selected and deselected central-cell neutral beams that were fueled with hydrogen gas. The end-cell neutral beams were always selected and fueled with deuterium. By taking the ratio of the hydrogen end-loss current (with a known deuterium-gas fed rate), they were able to infer the effective fueling rates that were due to wall reflux, central cell beams, and end cell beams. The results were the following: wall reflux, 6 Torr x l/s; central cell beams, 20 Torr×l/s; and end cell beams, 1 Torr x l/s.

29718 A time-resolved 14 MeV neutron detector for triton confinement studies. Smith, J.R. (GA Technologies, Inc., Oak Ridge, TN (USA)); Fisher, R.K.; Leffler, J.S.; Newman, D.E. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Previous measurements of triton burnup in deuterium tokamak plasmas show an anomalously small burnup for low-q discharges with significant MHD activity. This may have important implications for alpha particle burnup in a fusion reactor. By developing a detector capable of time-resolved 14 MeV neutron measurements, it should be possible to separate triton confinement and slowdown anomalies. The authors report how they are testing lithium-free glass scintillators which would observe 14 MeV neutrons through prompt $^{28}Si(n,p)^{28}Al$ reactions. These detectors are not sensitive to the much larger 2.5 MeV neutron background and should also have less sensitivity to the large thermal neutron background when compared to conventional ^6Li-depleted glasses. Measurements of detector sensitivity to signal and potential background sources have been performed using a 14 MeV neutron source and radioactive sources. The expected signal behavior under various DIII-D plasma and beam conditions is presented.

29719 Nuclear reaction diagnostics of fast confined and escaping alpha particles. Cecil, F.E. (Princeton Univ., NJ (USA). Plasma Physics Lab.); Medely, S.S.; Nieschmidt, E.B.; Zweben, S.J. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The resonant radiative capture nuclear reactions $D(\alpha,\gamma)6Li$, $6Li(\alpha,\gamma)$ 19B and $7Li(\alpha,\gamma)11B$ are examined as diagnostics of the energy distribution of confined fast alpha particles in tokamak plasmas. Count rates for realistic Q=1 DT plasma conditions are presented and compared to expected backgrounds. The design of and preliminary results from the prototype fusion gamma ray detector on TFTR are presented. The activation reactions are similarly examined as diagnostics of escaping fast alpha particles. Where possible, count rate estimates for Q=1 DT plasmas and proposed ignition devices are presented.

29720 Detector array for the measurement of the 14.7 MeV protron emission from TFTR. Strachan, J.D. (Princeton Univ., NJ (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The author reports the magnitude of the $d(3He,p)\alpha$ fusion emission measured of TFTR by detection of the prompt losses of 14.7

MeV protons. Such measurements are useful for the determination of ^{3}He transport coefficients following short ^{3}He gas puffs, the determination of the confinement of the 0.8 MeV ^{3}He ion produced in the d(d,n)^{3}He fusion reaction and the development of escaping alpha diagnostics. The TFTR system consists of four detectors poloidally distributed along the bottom of TFTR. Each detector spatially resolves 14.7 MeV protons which are born above the detector and which grad B drift into the detector. The detectors are surface barrier detectors positioned behind 20 mil stainless steel foils which prevent soft X-ray and lower energy charged fusion products from being counted.

29721 Neutron fluctuation measurements on TFTR. Heidbrink, W.W. (Princeton Univ., NJ (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The author reports measurements of fluctuations in the neutron yield made on TFTR with plastic scintillators. Light from the scintillators is coupled through fiber optic cables to photomultipliers operated in current mode. Discrimination against hard X-rays is accomplished through comparison with the signal from a ZnS(Li^6) scintillator. These measurements are useful in studies of deuterium pellet deposition, of the acceleration of beams ions during major radial compression, and of MHD instabilities. To study the mode numbers of the instabilities, detectors are situated at different poloidal and toroidal positions. Techniques for measuring the neutral beam density profile and Q^{equiv}_{dt} using neutron fluctuation measurements during pellet injection are proposed.

29722 Silicon surface barrier detector for fusion neutron spectroscopy. Elevant, T. (Royal Inst. of Tech., Stockholm (Sweden)); Handel, H.W.; Neischmidt, E.B.; Samuelson, L.E. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper presents an investigation of the usefulness of the intrinsic ^{28}Si(n,α)^{25}Mg and ^{28}Si(n,p)^{28}Al reactions in silicon surface barrier detectors for measurements of ion temperatures in D-T fusion plasmas and of D-T fusion neutron flux. For a 14-MeV neutron-generator narrow energy-line source, the energy resolution ($\approx$1.5%), detection efficiency and useful count rates have been determined. Based on these results, for a 100 ms time bin, D-T plasma ion temperatures from 2 to 6 keV can be determined from the FWHM of the neutron-induced α spectral lines, with the error estimated to be 25% to 5%, respectively. The maximum intrinsic detection efficiency for a nominal 1500 μm thick detector is $\approx 6 \times 10^{-4}$.

29723 Neutron diagnostics on TFTR utilizing the Campbelling technique. England, A.C. (Princeton Univ., NJ (USA)); Hendel, H.W.; Neischmidt, E.B. pp. 92 of The liver - biology and pathobiology. Second edition. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report modified commercial neutron counting equipment installed on a tokamak fusion test reactor (TFTR) which utilizes the Campbelling theorem to monitor the neutron source strength at very high neutron count rates. Campbelling utilizes the large amplitude fluctuation from neutron events in the detectors to discriminate against small amplitude noise events. Source strengths yielding equivalent count rates a factor of five higher than possible in the conventional count rate mode have been obtained to date. The concept of Campbelling is discussed and the particular application to TFTR is illustrated.

29724 Effect of ion speed distribution on the spectral shape of the 2.5 MeV neutron line produced in D-D fusion. Slaughter, D.R. (Lawrence Livermore National Lab., CA (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The author discusses how ion mean energy may be determined from Doppler broadening of the 2.5 MeV neutron line on Maxwellian deuterium plasma. Since many plasmas are non-Maxwellian, an Monte Carlo simulation has been used to predict the spectral shape produced by a variety of simple speed distributions with mean energies in the range 1-100keV. The results are Gaussian to high order and their width varies as the square root of the mean ion energy. However, the line width varies substantially among different ion speed distributions with the same mean energy. The similarity in shape of these spectra prevent the determination type from detailed measurements of the neutron spectrum.

29725 A fiber sensor neutron streak camera for ICF diagnostics. Kislev, H. (Illinois Univ., Urbana, IL (USA)); Miley, G.H. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors propose a design for a neutron streak camera for ICF burn studies. It uses a fiber optic sensor so that the camera itself can be removed from the target chamber. The sensor element is based on the decreased optical transmission (darkening) of a fiber optic doped with fissile material during neutron irradiation. The prompt darkening is proportional to the electron density, i.e., to the integrated neutron flux via the integrated fission rate. Since the characteristic time constant for fission-induced secondary-electron emission is $\approx$ psec, the darkening response time should be adequate. The sensor uses a fiber optic coiled in a spiral and mounted on a thin hollow-disk centered around the target. A synchronized short UV-laser pulse is injected into the sensor fiber and outward in the spiral at a radial speed matched to the expanding neutron front. An advantage over current designs is that sensitive and costly components are removed from the intense radiation field. The authors present calculations of minimum yield requirements, darkening time response, and overall temporal resolution.

29726 Debris collection from implosion of microballoons. Prussin, S.G. (Lawrence Livermore National Lab., CA (USA)); Lane, S.M.; Richardson, M.C.; Noyes, S.G. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report the recovery of krypton from implosion of glass microballoons studied on the development of a radiochemical diagnostic for determination of $<\rho r>$ fuel. Collection onto metal surfaces following implosions performed on the OMEGA laser with 1-3 TW (1-2 kJ) of 0.35μm light is consistent with an ion implantation mechanism. The dependence of the intrinsic collection efficiency on the energy fluence to the collector surface and its variation in implosions carried out under the same nominal conditions indicate ion energies extending to at least 0.1 MeV and energy distribution functions that are sensitive to the details of the implosion dynamics. Intrinsic sticking efficiencies approaching 0.5 can obtained in the limit of total energy fluence to the collector surface ($\leq$ 0.1 cm^2).

29727 Neutron spectroscopy on Nova. Cable, M.D. (Lawrence Livermore National Lab., CA (USA)); Lane, S.M.; Lerche, R.A.; Vieira, R.G.; Prussin, S. G. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Some fundamental properties of inertial confinement fusion implosions can be measured using diagnostics based on neutron spectroscopy. An instrument that will measure neutron spectra using time-of-flight techniques with an array of single-hit detectors is being developed for use on Nova. Its initial application , measurement of ion temperature is discussed. Other potential applications, such as measurement of fuel $<\rho R>$ are also discussed.

29728 Approaches to the diagnostics of alpha particles. Zweben, S.J. (Princeton Univ., NJ (USA). Plasma Physics Lab.). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Alpha particles from D/T reactions are expected to be produced at a power level of ≃5MW in $Q \simeq 1$ beam heated experiments in TFTR. They will become the dominant heating mechanism in future tokamak ignition devices. Although alphas should be well confined in these devices according to neoclassical orbit theory, the effects of plasma instabilities on alpha confinement and the effects of alphas on plasma confinement and heating remain to be seen. For diagnostic purposes, alphas fall into three general categories: fast confined alphas, which are to be detected inside the plasma at relatively high energy (E ~ .5-3.5 Mev), slow confined alphas, which are to be detected inside the plasma but after substantial thermalization has taken place (E ≈ .01-.5 MeV), and escaping fast alphas, which are to be detected at the wall or limiter (E > .5 MeV). For escaping alphas a relatively simple scintillation detector has been built and is presently being tested on TFTR. For slow confined alphas a charge exchange recombination spectroscopy system (similar to that which has already measured thermal He^{++} in PDX and D-III) should be feasible and will be tested at $Q \simeq 1$ in TFTR. However, for fast confined alphas the diagnostic problem appears to be much more challenging, and suitable diagnostic techniques have not yet been developed. This paper reviews recent progress and prospects in these alpha diagnostic areas.

29729 Diagnostics of space plasmas. Bame, S.J. (Los Alamos National Lab., NM (USA)); Belian, R.D.; McComus; Young, D.T. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Diverse plasmas have been observed in the magnetospheres of Earth and other planets, and in interplanetary space. Recently, plasmas and fields were measured by a space probe in the coma and tail of comet Giacobini-Zinner. In the various plasma regimes of space investigated during the space era, a wide range of characteristics has been found: particle densities from < 0.01 to 1000 per cc, energies from < 1 eV to amny MeV, temperatures from < 1 eV to > 1000 eV, and bulk flow speeds from near stationary to > 1000 km per s. A wide range of plasma wave activity and instabilities characterized these plasmas. The measurements are made with a variety of instruments ranging from electrostatic analysis with time-of-flight or magnetic analysis in order to identify the ions and their charge states. This paper outlines the plasma regimes encountered in space. The authors discuss instrument design principles and constraints imposed by limited spacecraft resources, and describe some of the instruments used.

29730 Magnetic-fusion data acquisition at Los Alamos. Wilkins, R.W. (Los Alamos National Lab., NM (USA)); Klare, K.A. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors discuss the use of a single software program to acquire data from hundreds of CAMAC recorders. For the past five years, this program has been used in all of their experiments, both manual and computer controlled. A variety of signals are stored on transient digitizers and other memories. The computer retrieves the data and applies an efficient compression algorithm before storing it on disk. The physicist can plan the next shot from the acquired data even as the rest is read. The readout is list-directed with device, amplifier, and time base types and their settings selected by the physicist. A new experiment may be set up in minutes.

29731 Multi-chord, near infrared interferometers for the CTX and ZT-40M experiments. Newman, E.W. (Los Alamos National Lab., NM (USA)); Buchenauer, C.J.; Hoida, H.W. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

A versatile, multi-chord CO_2 interferometer design with a wide dynamic range is adapted to several different experiments. The systems are double-pass, Mach-Zehnder, heterodyne, interferometers that employ a single germanium Bragg cell and $2^{n+1} - 1$ (n an integer) 50% beamsplitters to produce 2^n interferometer chords, and a single reference beam with matched optical path lengths. Heterodyne signals detected with room-temperature HgCdTe photo-resistors are demodulated with digital phase detectors that can track several fringes per μsec. The real-time electron density readouts provide a considerable savings in ADC channels and computation time when compared with quadrature phase detection schemes. High reliability is achieved with a temperature controlled wave-guide CO^2 laser operating in a single mode at intermittent duty. The CTX instrument has been operating with 8 chords since March, 1984. The ZT-40M instrument, which is under construction, employs a second wavelength to correct for room vibrations in the 0.01 fringe density range.

29732 Digital complex demodulation applied to interferometry. Powers, E.J. (Texas Univ., Austin, TX (USA)); Bengtson, R.D.; Brower, D.L.; Luhmann, N.C. Jr.; Peebles, W.A.; Choi, D.; Joyce, G. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). Contract F49620-82-C-0033. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

A common problem associated with many interferometers used for plasma diagnostics is miscounting of fringes due to noise, and relatively poor time response. It is the purpose of this paper to point out that a digital technique known as complex demodulation offers an attractive alternative to analog demodulation. The detector output is digitized directly and transferred to a computer where it is demodulated by multiplying by $\exp(i\ \omega_o t)$ and digitally low pass filtering. The filter output is the desired demodulated signal. In this paper, the authors describe the digital complex demodulation technique and demonstrate its superiority by comparing it with conventional analog demodulation data obtained with an FIR interferometer on the TEXT tokamak.

29733 Study of optically thin electron cyclotron emission from TFTR using a Michelson interferometer. Stauffer, F.J. (Maryland Univ., Baltimore, MD (USA)); Boyd, D.A. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). Contract AC02-76-CH03073. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The TFTR Michelson interferometer, which is used as an electron temperature diagnostic, has a spectral range of 75-540 GHz. This range is adequate for measuring at least the first three cyclotron harmonics, and it spans both optically thick and thin portions of the ECE spectrum. During the most recent opening of the TFTR vacuum vessel, a concave, carbon reflector was installed on the back wall of the vessel, opposite the light collecting optic of the Michelson system. The reflector is designed to prevent the observation of optically thin ECE that originates from a location that is outside the field of view of the light collecting optic. If this is achieved, it should be possible to derive the electron density profile from measurements of either the extraordinary mode third harmonic or the ordinary mode second harmonic. An analysis of ECE spectra that have been measured before and after installation of the reflector is presented.

29734 Installation and calibration of a grating spectrometer for electron cyclotron emission measurements using circular waveguide. Lohr, J. (GA Technologies, Inc., Oak Ridge, TN (USA)); Johns, G.; Moeller, C.; Prater, R. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The grating spectrometer installation on the DIII-D tokamak is discussed. It uses fundamental circular waveguide propagating the TE_{11} lowest order mode followed by oversized circular guide carrying the low loss TE_{01} mode. The short section of fundamental guide permits use of an electronic chopper operating at 50 kHz for both calibration and plasma operation. By using a.c.-coupled amplifiers tuned to the chopping frequency, the background signal generated in the InSb detectors by neutrons and x-rays is automatically subtracted and the system noise bandwidth is reduced. Compared with a quasi-optical system, the much smaller fundamental horn and front end waveguide allow the entire waveguide system to be located outside a gate valve. With this configuration the entire waveguide run, including the actual horn and vacuum window used during plasma operations, can be included in the calibration set-up.

29735 Resolving the propagation direction of tokamak microturbulence via homodyne spectroscopy. Brower, D.L. (California Univ., Berkeley, CA (USA)); Peebles, W.A.; Luthmann, N.C. Jr.; Powers, E.J.; Ritz, C.P. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

A new homodyne spectroscopy technique has been applied to tokamak microturbulence measurements in order to ascertain the frequency spectra and wave propagation direction of low-frequency density fluctuations. This method has been used in conjunction with collective scattering of far-infrared laser radiation experiments on the TEXT tokamak. Application of the new homodyne spectroscopy technique provides a high resolution, inexpensive and easily implemented alternative to the more technically demanding heterodyne detection schemes typically available in the far-infrared. The authors present a comparison of heterodyne and the new homodyne spectroscopy results.

29736 An ECE diagnostic for the TARA tandem mirror machine using a fast-scanning Michelson interferometer. Guharay, S.K. (Maryland Univ., College Park, MD (USA). Lab. for Plasma and Fusion Energy Studies); Boyd, D.A.; Ellis, R.F. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The ECE diagnostic utilizes a fast-scanning Michelson interferometer to determine two parameters, the temperature and the loss-cone-angle, of the distribution function of the hot electrons ($T \gtrsim 100$ keV) generated in the axisymmetric plug plasma of the TARA tandem mirror device. The radiation transport system employs a lens relay and a low-pass grating filter in order to transmit the synchrotron radiation spectrum over a spectral range of 2.9 - 18.6^{-1}. This enables the authors to study the emitted radiation spectrum up to the 40th harmonic of the fundamental electron-cyclotron frequency in the plug plasma ($B \simeq 5$ kG). Details of the design principles and the development of the diagnostic at TARA are presented.

29737 Development of an FIR interferometer for ATF: Part II - system design. Casson, W.H. (ORNL (US)); Hutchinson, D.P. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Because of the highly elliptical cross section of the advanced toroidal facility (AFT) plasma, a large number of interferometer channels are required to determine the radial density profile by Abel inversion. The authors discuss how a 15-channel system is being developed using a single fan shaped beam through the plasma and observing the phase shift across the profile with a 15 element detector array. The laser output at 119 microns will be transmitted about 10 meters from the laser to the plasma device via an oversized dielectric waveguide. A surface grating will be used to redistribute the Gaussian power distribution to a sinc type distribution. The beam will then be expanded in one dimension and focused through the plasma. It will then be combined with the local oscillator and focused on the detector array. Commercial Schottky diodes mounted in corner cube reflectors will be used as mixers. The entire system will be controlled by computer including the lasers and the data acquisition system.

29738 Improved system for perpendicular electron-cyclotron emission measurements on TMX-upgrade. Lasnier, C.J. (Maryland Univ., Baltimore, MD (USA)); Ellis, R.F.; James, R.A. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Perpendicular electron-cyclotron emission (PECE) is used on TMX-U to diagnose thermal-barrier hot electrons (t_H - 100 to 400 keV)yielding the time history of the density and temperature of these relativistic electrons. The authors describe an improved quasi-optical viewing system for these measurements that uses high sensitivity super-heterodyne receivers at fixed frequencies of 60, 98, 130, and 195 GHz. The improved viewing and transport system consists of an off-axis ellipsoidal mirror that images the plasma onto a V-band conical collection horn, an overmoded circular waveguide ($\sim$ 7/8' diam) that transports the radiation outside the vacuum vessel where the polarization is selected, and a high absorptivity Macor beam dump to prevent internal wall reflections from entering the viewing system. A relativistic code is used to calculate optically thin PECE signals from relativistic electrons for various energy and pitch angle distributions.

29739 Alcator C vertical viewing electron cyclotron emission diagnostic. Kato, K. (Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center); Hutchinson, I.H. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

ECE (electron cyclotron emission) measured vertically through the center of a tokamak plasma yields detailed information about the electron velocity distribution. A diagnostic developed for this purpose on Alcator C tokamak uses specialized focussing optics to obtain a well collimated viewing chord, a compact viewing dump made of pyrex or macor to reduce the effects of wall reflection and depolarization, and a rapid scanning Michelson interferometer-InSb detector system for the spectrum measurement; all constrained by the limited access and the compact size of Alcator C. Detailed calculations behind design decisions are discussed. ECE spectra obtained by this diagnostic, as well as the results of velocity distribution analysis, are presented.

29740 A new diagnostic for spheromaks: What are the possibilities. Boyd, D.A. (Maryland Univ., Baltimore, MD (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Electron cyclotron emission from a spheromak plasma may be able to provide information about the confining magnetic field of the system. Emission generated in the extraordinary mode wit hits electric vector perpendicular to the local magnetic field at sufficiently high frequency will propagate out of the plasma while retaining the original orientation if its electric vector. Thus, a measurement of the orientation of the emergent electric vector and the emission frequency will allow one to deduce the orientation and strength of the magnetic field at the radiation source. In this paper, simple models of the Maryland spheromak are used to examine the practicality of such a diagnostic.

29741 A 137 GHz gyrotron diagnostic for instability studies in Tara. Machuzak, J.S. (Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center); Cohn, D.R.; Gerver, M.; Guss, W.; Mauel, M.; Mulligan, W. J.; Post, R.S.; Temkin, R.J.; Woskoboinikow, P. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma

Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report on a narrow linewidth (< 100 kHz), 1 kW, 137 GHz gyrotron and an efficient TE03 to TE11 cylindrical waveguide mode converter set (> 97% TE11 mode output) built for collective Thomson scattering diagnostics. The main goal will be to study instability driven ion density fluctuations in the Tara plug such as the drift cyclotron loss cone (DCLC), the axial loss cone (ALC), harmonics of the DCLC and ALC, and the ion two stream instability. The heterodyne receiver and signal optics have been installed on Tara. Background electron cyclotron emission (ECE) at 139 ± 1.5 GHz after electron cyclotron resonance heating in the Tara plug corresponded to equivalent blackbody temperatures of 363 and 73 eV for extraordinary and ordinary emission, respectively. The well collimated receiver field of view completely through the TAra plug has allowed for excellen polarization discrimination of the ECE. The high power capability of this gyrotron will allow weak fluctuations to be detected above this background during ECRH heating in the plugs.

29742 Measurements of waves, fields, and particles in a laboratory plasma. Gekelman, W. (California Univ., Los Angeles, CA (USA). Dept. of Physics). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). Grant NSF-Phy84-10495. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

A laboratory plasma, diagnostic probes, and data acquisition system have been designed to permit highly detailed measurements of magnetic field reconnection and wave and particle interactions. The plasma is produced with an oxide coated cathode at a 1 H_z repetition rate. Data is acquired by a system consisting of a data acquisition computer linked to a Vax computer and online array processor, by a fast network. In reconnection experiments a current sheet is established embedded between antiparallel magnetic fields. The magnetic field topology is measured at 4000 spatial locations and 1000 time steps by three orthogonal loops moveable anywhere within the plasma volume. Fully three dimensional data are presented stereo-scopically. Fluctuations of the magnetic fields are studied by correlation techniques which yield the three dimensional propagating whistlers. A highly directional velocity analyzer is used to measure the particle distribution functions at 360 angles in velocity space.

29743 Diagnostics using an injected neutral helium beam. Levinton, F.M. (JAYCOR, Albuquerque, NM (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

A diagnostic for measurement of the internal magnetic field and the ion temperature is described which is applicable to the current generation of magnetic fusion devices. The technique involves the injection of a neutral helium beam into the plasma. The magnetic field can be determined from Zeeman spectroscopy using laser induced florescence or collisional excitation of the beam. Ion temperature measurements can be made from doppler broadening of the charge exchange recombination radiation or elastic scattering of the beam particles. Details of the beam propagation through the plasma are solved numerically using a system of coupled rate equations. The diagnostic is suitable for a wide range of plasma and machine parameters. Results from computer simulations have been obtained for the S-I spheromak and TFTR which show ~ 50% of a keV beam can penetrate to the center of the plasma.

29744 Simultaneous detection of multiply charged species from a heavy ion beam probe. Jennings, W.C. (Rensselaer Polytechnic Inst., Troy, NY (USA)); Hichok, R.L.; Michael, J.D.; Saravia, E. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Two electrostatic energy analyzers are currently in use on the RENTOR beam probe system to provide detection of both 2^+ and 3^+ secondary ions. The dual analyzer detection system permits simultaneous evaluation of n_e, T_e, as well as the standard space potential measurement. Sensitivity for separating n_e and T_e is very good for electron temperatures less than 150 eV which makes this technique attractive for studying the edge regions of large tokamaks. The 500 kHz frequency response permits fast (≥1 msec) radial scans (≥25 cm) and simultaneous multi point measurement of fluctuation spectra. Separation of the observation points can be continuously varied to provide direct study of correlation lengths. Signal to noise ratio for the 2^+ measurements is greater than 3/l and for the 3^+ measurements greater than 2/l. Typical data are presented. The accuracy and sensitivity are discussed.

29745 A two-dimensional Thomson scattering system for ATF. Kindsfather, R.R. (ORNL (US)); Rasmussen, D.A.; Thomas, C.E.; Paintor, S.L.; Hays, P. S.; Morris, R.N.; Tolnas, E.L. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report a two-dimensional Thomson scattering system being designed for ATF. The system will provide electron temperature and density measurements at fifteen points along a vertical chord with each laser shot. By relocating the laser beam, and reconfiguring the input optics on subsequent laser shots, a two-dimensional electron temperature and density map of the ATF cross-section can be obtained. Translating and rotating mirrors are used to relay the light from the viewing port to a fixed focal length lens. Low temperature (2 eV to 200 eV), intermediate temperature (10 eV to 1 keV), and high temperature (20 eV to 2keV) spectrometers are used. At the output of each spectrometer dispersed light is detected by an array of five, seven, or eight photomultiplier tubes depending on the temperature range of the spectrometer. Source light will be provided by a twenty-five joule low divergence ruby laser.

29746 The PLT and PDX charge-exchange analyzers. Mueller, D. (Princeton Univ., NJ (USA)); Hammett, G.; McCune, D.C. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The perpendicularly-viewing mass-resolving charge-exchange analyzers for PLT and PDX were built to measure the plasma ion temperature, central neutral density and hydrogen to deuterium ratio. This paper discusses the measurements as they are affected by instrumental effects. In PDX with perpendicular neutral deuterium beam injection into hydrogen plasmas, a small (≈ 1%) hydrogen impurity in the beam gives rise to an energetic tail on the observed hydrogen neutral spectrum. A simple model indicates that this contamination of the thermal spectrum causes the apparent ion temperature to be 5-20% too high. This effect is included in the analysis. The neutral density measurement relies on knowledge of absolute detection efficiency. While this can in principle be measured in-situ with a diagnostic neutral beam, a large uncertainty remains. Measurement of the H/D ratio in the plasma is limited by the mass rejection (1:1000) of the analyzer. It is primarily the deuterium flux at 1/2 the hydrogen energy that places a lower limit on the measurable flux to H/D ratios above ≈ 0.5%.

29747 Multichannel Thomson scattering systems with high spatial resolution. Johnson, D.W. (Princeton Univ., NJ (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

In the last 10 years, Thomson scattering systems capable of producing single snapshot profiles of electron temperature and density with high spatial resolution (> 50 channels) have become routine diagnostics on the PLT, PDX, and TFTR tokamaks. During this period, the technology associated with these systems has advanced

on several fronts. Low divergence ruby lasers with high output energies which are stable for many months have been developed. Large area, gateable, intensified CCD detectors combined with flexible, low noise readout systems offer high sensitivity and high spatial resolution with good background suppression. Information encoded in the video field gives checks on the image justification and the laser alignment. Laser triggered sparkgaps provide failsafe detector synchronization. Stacked pyrolytic graphite blade dumps tolerate high power loads from plasma while reducing stray laser light. Concentric objective optics provide high throughput, wide angle viewing and tightly packed, coherent, low loss quartz fiber bundles alow remote sensing of the scattered signal statistics while suppressing the background component. Equally important in determining the overall accuracy of such measurements are the calibration techniques. These are described along with a catalog of profile results which demonstrate the capabilities of these systems. The author discusses how the viewing geometry of these systems also lends itself to other measurements including spatially resolved plasma emission and custom edge Thomson scatterinscattering.

29748 A double parallel-plate electrostatic analyzer for Tara endloss studies. Sullivan, J.D. (Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center); Casey, J.A.; Irby, J.H.; Smith, D.K. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report on an endloss spectrograph designed and being fabricated for the Tara tandem mirror. This spectrograph is a double parallel-plate electrostatic analyzer about 60 cm in length with a 30 deg. entrance angle; the high voltage plate is a transparent wire cloth grid which allows higher energy particles to pass through for detection on a symmetric ground plane. The analyzer has three detection planes: first, the normal focal plane for low energy detection at high resolution (100eV to 4keV); second, the entrance grounded plate for mid energies (4 to 6keV); and third, the symmetric ground plane for coarse resolution at higher energies (8 to 20keV). This spectroscope will be able to measure simultaneously the endloss potential cutoff and ions from the neutral beams: in conjunction with a loss cone neutral beam source, the resolution is sufficient (60eV) to measure the plasma potential.

29749 Double scatter neutron time-of-flight spectrometer as a plasma diagnostic. Walker, S.E. (Phillips Petroleum Co., Bartlesville, OK (USA)); Preszler, A.M.; Millard, W.A. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The energy and flux measurement of D-D and D-T fusion neutrons provides a nonperturbing probe of plasma performance. In particular, ion temperature distribution of the plasma can be determined. This information can distinguish neutron production mechanisms, i.e. knock-on or thermonuclear in origin. To perform a fast neutron measurement, a high data rate double scatter spectrometer has been developed. This allows for a definitive measurement of the flux, energy, angle, and time distributions of neutrons from within the plasma. In addition, x-ray discrimination can be achieved from the time-of-flight information. The specific design issues and performance of the spectrometer are described.

29750 Measurements of mildly relativistic electron distribution functions during lower hybrid heating. Hutchinson, I.H. (Massachusetts Inst. of Tech., Cambridge, MA (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Heating and current-drive by Landau damping of LH waves on electrons creates energetic tails on the distribution function whose form determines the wave power deposition and any current generated. Therefore, experimental investigation of these tails is of significance for understanding the details of the heating/current-drive performance. The author reports progress made towards a detailed diagnosis of the energetic electrons by two complementary techniques: x-ray emission due to Bremsstrahlung, and electron cyclotron emission. The x-ray diagnosis takes advantage of the relativistic beaming of radiation in the forward direction to obtain information on the electron distribution-function-anisotropy from measurements along different viewing directions. Fits of 3-or4-parameter model distributions reveal the strong forward/backward asymmetry of current-drive plasmas and the difference between parallel and perpendicular tail temperatures. The electron cyclotron emission, when viewed along a chord of constant magnetic field (i.e. vertically in a tokamak), arises from electrons whose cyclotron frequency has been down-shifted by the relativistic mass shift. There is therefore a one-one relationship between wave frequency and electron energy, provided cyclotron harmonic overlap is negligible.

29751 Two-dimensional tokamak density distribution measurements using phase-imaging interferometry. Doyle, E.J. (California Univ., Berkeley, CA (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Conventional interferometer systems used on fusion devices are typically limited to approximately 10 channels/views. This precludes the use of tomographic reconstruction techniques. Instead, a priori assumptions have to be made as to the form of the electron density distribution. To overcome these problems interferometer systems have been developed which use imaging techniques to provide many channels per probe beam, allowing a greatly increased total number of channels to be provided. Using a two-dimensional, forty channel, imaging FIR interferometer measurements have been made of the density distribution in the minor cross-section of the Microtor tokamak. The heterodyne interferometer consists of two probe beams expanded so as to completely fill orthogonal views of the plasma cross-section. These views are then imaged onto two, twenty channel, linear microbolometer detector arrays. The line integrated phase information obtained from this system is analyzed using tomographic techniques so as to recover the spatial electron density distribution in the plasma. Density contours obtained on the Microtor tokamak are presented. They show the startup phase, hollow profiles and the effect of reducing the number of analyzed channels.

29752 Data-base tools for enhanced analysis of TMX-U data. Stewart, M.E. (Lawrence Livermore National Lab., CA (USA)); Carter, M.R.; Casper, T.A.; Meyer, W.H.; Perkins, D.E.; Whitney, D.M. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors use a commercial data-base software package to create several data-base products that enhance the ability of experimental physicists to analyze data from the TMX-U experiment. This software resides on a Dec-20 computer in M-Divisions's user service center (USC), where data can be analyzed separately from the main acquisition computers. When these data-base tools are combined with interactive data analysis programs, physicists can perform automated (batch-style) processing or interactive data analysis on the computers in the USC or on the supercomputers of the NMFECC, in addition to the normal processing done on the acquisition system. One data-base tool provides highly reduced data for searching and correlation analysis of several diagnostic signals for a single shot or many shots. A second data-base tool provides retrieval and storage of unreduced data for detailed analysis of one or more diagnostic signals. The authors report how these data-base tools form the core of an evolving off-line data-analysis environment on the USC computers.

29753 Zone plate imaging of neutrons emitted from a laser fusion target. Lerche, R.A. (Lawrence Livermore National Lab., CA (USA)); Lane, S.M.; Hawryluk, A.M.; Ceglio, N.M. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma

diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report on zone plate coded imaging techniques, routinely used to image non-penetrating emissions from laser fusion targets. Only highly penetrating radiations like 14-MeV neutrons will escape the dense compressed core region of future targets to provide information about the burn region. A zone plate for 14-MeV neutrons must be several centimeters thick to produce adequate modulation in the coded image. Computer modeling of zone plate systems show that a thick, tapered zone plate acts like a thin zone plate for points within its field of view and depth of field. Equations developed for thin zone plate systems that describe quantities such as planar and tomographic resolution may be applied to thick zone plate systems. System simulations of a 100-zone, 5-cm-thick zone plate with 5-μ outer zone width constructed of alternating layers of gold and aluminum produce images with 10-μ resolution. The source strength required to image a 20-μ diameter source is 100 to 1000 times less than that needed with an equivalent pinhole system.

29754 The injected internal target technique, (IT)^2, for hot electron diagnostics. Moses, K.G. (JAYCOR, Albuquerque, NM (USA)); Quon, B.H.; Divergilio, W.F. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

A neutral Xe atom beam injected into a hot electron plasma will generate enhanced x-ray emission locally in the path of the beam by bremsstrahlung and K-Shell ionization processes. A collimated x-ray detector system analyzes the energy distribution of the photons emitted by the beam atoms inside the volume occupied by the plasma. From the slope of photon intensity vs photon energy data, one can determine the local electron temperature, from the photon intensity of the Kα emission, one can obtain the local hot electron density. The measurement requires a high quality heavy atom beam with effective current densities $\approx$ 50 mA/cm^2 at ~50 keV energy. The design and test results of the beam system are presented.

29755 Detection limits in the measurement of alpha particles by CO_2 laser Thomson scattering. Richards, R.K. (ORNL (USA)); Hutchinson, D.P. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

It is found for plasma conditions expected during ignition studies ($n_e \sim 10^{14}$cm $^{-3}T_e \sim$10 keV) that alpha particle densities as low as 10^{11}cm^{-3} can be measured with CO_2 laser Thomson scattering. This detection limit is discussed. It is set by the background signal from the electrons and will change with the plasma conditions, increasing for increasing electron temperature and decreasing for increasing electron density. The effect of the B-field in producing a spatially concentrated alpha particle signal does lead to an improvement in detecting the alpha particles over the electrons. However, this improvement is typically only a factor of two or three. The reason for such a minimal improvement is that a large detector bandwidth (required for heterodyne detection) broadens the B-resonance. The principal effect of the B-field is to greatly reduce the area needed for detection.

29756 Design of a high power long pulse CO_2 laser for alpha particle Thomson scattering. Hutchinson, D.P. (ORNL (USA)); Vander-Sluis, K.L. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-8603224–: 52. Melchett lecture, London (UK), 6 Mar 1986).

A high power CO_2 laser is being constructed to measure the velocity distribution of alpha particles in a burning plasma. The laser system is being designed around a Lumonics 602 TEA CO_2 laser. A low-pressure cell will be placed in the unstable resonator cavity to produce a long-pulse, narrow-linewidth beam. Details of the laser design are presented.

29757 High time resolution temperature profile measurements on PBX. Gammel, G.; Fonck, R.; Kaita, R. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Ion temperature profiles with a time resolution of 2-5 ms have been measured on PBX by charge exchange recombination spectroscopy (CXRS) and a neutral particle charge exchange analyzer (NPA). The sightlines of both diagnostics crossed the trajectory of a near-perpendicular heating beam, which enhanced the local neutral density (A signal strength) and provided spatial resolution. The time resolution of these two independent techniques is sufficient to see sawtooth oscillations and other MHD activity. The NPA results, with the contribution from the slowing-down heating beam particles subtracted, are compared with CXRS. Effects of these phenomena on the toroidal rotation velocity profile, vϕ (r), are clearly observed by CXRS. For example, a sharp drop in the central vϕ occurs at the sawtooth crash, followed by a linear rise during the quiescent phase. The techniques are described and sources of error are described.

29758 Charge conversion of alphas by refueling pellets. Gerdin, G. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

In this paper, the neutral gas surrounding a refueling pellet is considered as a charge changing medium for diagnostics of alphas below 1 MeV. Alphas may be neutralized so they escape the system entirely or excited He^+ states can be created by electron capture and the doppler-shifted radiation observed. The neutral-shielding model was used to obtain radial profiles of neutral and plasma density and temperature surrounding the pellet. This model predicts plasma densities and temperatures in the collar plasma surrounding the pellet consistent with experiment. Conditions for a pellet injected into TFTR during a 33.5 MW neutral beam pulse are taken from a simulation. For such conditions ion and electron impact ionization in the collar plasma reduce the escape probability below 10^{-7} and n_α must be $\approx 10^{11}$/cm^3 for the doppler-shifted radiation near 1640 Å to be equal to the free-bound bremsstrahlung from the collar plasma.

29759 Scintillation detector for escaping alphas and tritons in TFTR. Zweben, S.J. (Princeton Univ., NJ (USA). Plasma Physics Lab. (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The author describes a diagnostic for escaping charged fusion products presently being tested on TFTR. It consists of a 1" x 1" ZnS scintillator screen located inside a movable probe at the bottom of the TFTR vacuum vessel. Escaping 3.5 MeV alphas or 1.0 MeV tritons are first collimated by four separate 1mm aperatures and passed through ~3μ Al foils used to block plasma light and low energy plasma. These pulses are then optically coupled to PM tubes and/or an intensified video camera for recording and analysis. First tests will include checks of the neutron and gamma backgrounds (made with one channel with a foil which stops all alphas), and observations of the measured vs. expected particle flux vs. plasma current, toroidal field, etc.

29760 Application of coincidence techniques to fusion product measurements. Murphy, T.J. (Princeton Univ., NJ (USA). Plasma Physics Lab. (USA)); Heidbrink, W.W.; Strachan, J.D. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

A technique is described in which the two products of a fusion reaction are measured in coincidence. Measuring the energies of

both particles allows the energies of the reacting ions to be calculated. The difference in the arrival times of the two particles at their respective detectors yields the difference in the path lengths from birth location to detector, and can be used to identify the location of the fusion reaction. The technique can be used to measure the spatial distribution of the full-, half-, and third-energy components of a high-energy neutral deuterium beam and the spatial distribution of the reactions in a magnetic fusion device. Possible detector arrays and sample count rates have been evaluated for $d(d,n)^3He$ reactions in TFR, for $d(t,n)\alpha$ reactions in TFTR, and for d(d,p)t reactions in the TFTR neutral beam lines.

29761 **A neutron calorimeter as a fusion diagnostic.** Proctor, A.E. (Idaho National Engineering Lab., Idaho Falls, ID (USA)); Harker, Y.D.; Neischmidt, E.B. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract AC02-76CH03073. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

A calorimeter is described which is applicable as a fusion neutron diagnostic. The advantages of the device are discussed, including: low sensitivity to thermal neutrons, no heat loss to surroundings, large dynamic range, small mass resulting in fair time resolution, and small physical size. The heat generation is provided by neutron induced fissions in a foil of ^{238}U and a calorimeter is isothermal. The effects, advantages and disadvantages of other target materials are discussed. Also discussed are time resolution and calibration.

29762 **Analysis programs and standardization of the neutron activation system at TFTR.** Neischmidt, E.B. (Idaho National Engineering Lab., Idaho Falls, ID (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract AC02-76CH03073. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The recently installed neutron activation system at the TFTR has been calibrated and the analysis programming largely completed. Data analysis programs are available on an on-line aquisition-analysis system or off-line on a VAX system. Analysis techniques include random and coincident summing corrections as well as finite source size correction at close geometries. Detector efficiency determinations also use these corrections. The application of these corrections to efficiency measurements is discussed. Also discussed are the various types of fits to gamma-ray data encountered using the neutron activation system.

29763 **Neutron diagnostics of compressed ICF targets.** Richardson, M.C. (Rochester Univ., NY (USA). Lab. for Laser Energetics); Keck, R.; Letzring, S.A.; McCrory, R.M.; McKenty, P.; Roback, D.; Soures, J.M.; Verdon, C.P.; Lane, S.M.; Prussin, S. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract FC08-85DP40200. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The final stages in the compression of microencapsulated DT fueled ICF targets require detailed characterization of meaningful comparison with predictions of hydrodynamic codes. The determination of such parameters as the fuel and shell areal densities, the average ion temperature, and the impact of implosion nonuniformities in high density target implosions present a strong challenge. The authors describe several approaches utilizing the self-generated neutrons, to diagnosing these conditions, including neutron spectrometry neutron activation of tracer gas and shell materials, and neutron scattering techniques. The importance of making simultaneous measurements of several core parameters to limit ambiguity in interpretation is discussed.

29764 **Development of an FIR interferometer for ATF: Part I - high power FIR laser development.** Casson, W.H. (ORNL (USA)); Hutchinson, D.P. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report on an FIR interferometer system for the advanced toroidal facility (ATF) developed with some major modifications to previous designs. Due to the highly elliptical cross section of the plasma and the projected plasma densities a 15 channel interferometer was designed to operate at 119 microns. The large number of channels necessitated the construction of a high power FIR laser with a fundamental mode Gaussian output over 500 milliwatts. Laser stability has been improved. The final design of the pump laser is modular to the extent that any single optical component can be removed and replaced without changing the optical alignment. The FIR cavity was modified by changing to a smaller bore, using gold coated end mirrors, and using curved internal reflectors. The addition of buffer gas to the cavity provided significant improvement in output power.

29765 **High power, twin frequency FIR lasers for plasma diagnostic application.** Lehecka, T.; Savage, R.; Dworak, R.; Peebles, W.A.; Luhmann, N.C. Jr. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The development of imaging interferometry and multichannel heterodyne scattering systems for fusion plasma diagnosis has dicated the development of high power, stable twin frequency sources in the 100 $\mu m \rightarrow$ 1000 μm spectral region. Output powers of 500mW (185 μm), 150mW (393 μm), 100mW (496 μm), and 25mW (1.22mm) have been measured directly on a calorimeter applying no correction factors. These powers have been achieved via the optimization of the CO_2 and FIR laser cavities together with the use of buffer gases (to relative bottlenecking) and variation of the pumped molecular gas temperature (to optimize the groundstate population). The source IF jitter on twin frequency FIR laser systems has also been investigated in detail. The effect of CO_2 and FIR feedback on the IF frequency has been studied with the view of producing low cost stable laser systems without complicated active stabilization. A comparison between a novel twin frequency laser involving a single optical cavity and a conventional system involving two separate cavities has been performed. The conclusions from these studies are discussed. They have been utilized in the design of laser systems operational on the TEXT tokamak and at UCLA.

29766 **Test-particle simultions of Fermi acceleration of electrons at quasiperpendicular shocks.** Gisler, G. (Los Alamos National Lab., NM (USA)). pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

This work concerns a type of first-order Fermi electron acceleration accociated with quasiperpendicular shocks. Ion-scale transverse waves in the magnetic field upstream of the shock do not scatter electrons because the field remains nearly constant on electron scale lengths. However, when these waves are advected into the shock, the leading edges are compressed first, producing mirror points for a large fraction of the electrons. Thus a population of electrons is trapped in a flux tube between two such mirror points that converge together as the field continues to advect into the shock. A similar trap is formed when straight field lines are advected into a concave region of a corrugated shock. In either case, the population is longitudinally accelerated by compression between converging mirrors. The acceleration is limited by (1) the acceleration of an electron into the loss cone, (2) the passage of the shock past the trapped flux tube, and (3) the scattering of an accelerated electron to a perpendicular momentum large enough to allow its gyrotropic escape from the flux tube. A few electrons, having special initial conditions, can be accelerated by this means to energies thousands of times greater than their injection energies. Starting from a Maxwellian distribution of initial energies, the resulting particle energy spectrum is a mildly heated (factors of two to five) Maxwellian plus a power law to very high energies with an index – 2.6 Test-particle simulations of this process are done for

parameters appropriate to the Earth's bow shock and for supernova-remnant parameters.

29767 **Microwave tokamak experiment (MTX) status and plans.** Hooper, E.B. (Lawrence Livermore National Lab., CA (USA)); Allen, S.L.; Brown, M.D.; Byers, J.A.; Casper, T.A.; Fenstermacher, M.E.; Foote, J.H.; Futch, A.H.; Hwang, D.; Lasnier, C. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). DOE Contract W-7405-ENG-48. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The MTX program has focused on ohmic operation of the tokamak (Alcator-C moved from MIT), construction of the free-electron laser (FEL) microwave source and quasi-optical transport system, and preparation for the first measurements of absorption. The first microwave pulses from the FEL to the tokamak are planned for this spring. Measurements of the absorption of single high peak power pulses (140 GHz, 2 GW, 20 ns) will be done through September. Starting in October 1989, the FEL will be upgraded to generate pulses at 5 kHz for 10 ms, providing an average power 0.5-1 MW. A year later, the system will be further upgraded to 250 GHz and 2 MW average power. Following the upgrade to multiple-pulse operation and subsequent absorption measurements, experiments on heating and transport will be carried out. Attention will be directed to heating in peaked density profiles generated by pellet injection and to the effects of varying the power deposition profile. Plans include heat-pulse experiments and other measurements of local transport. Density fluctuations will be monitored by forward scattering of the far-infrared interferometer beams. Longer-term plans include noninductive current drive and MHD control and are outlined.

29768 **$\tilde{K}_e$ analysis and propagation direction sensitivity of HIBP data from TEXT.** Heard, J.W. (Rensselaer Polytechnic Inst., Troy, NY (USA)); Crowley, T.P.; Schoch, P.M.; Connor, K.A.; Hickok, R.L.; Yang, X.Z. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The heavy ion beam probe (HIBP) makes localized measurements of density and potential fluctuations in TEXT using a two point measurement scheme, the data can be analyzed to determine the average wavenumber, $\bar{K}$, and the cross-correlation of the signals at the two points. The authors intend to present minor radius and line averaged density scaling of $\bar{K}$. The motivation is to evaluate the feasibility of the HIBP to achieve a spatially resolved measurement of two distinct waves propagating in opposite diamagnetic drift directions. First, a simulation of the two wave model will be presented to show if correlation time analysis can distinguish the two modes. Analysis of actual data is presented with comparison of the calculated $\bar{K}$ component with theory to obtain an accurate heat transport estimate.

29769 **Theory and measurements of electrophoretic effects in monolith, fixed-bed, and fluidized-bed plasma reactors.** Morin, T.J. (Idaho Univ., Moscow, ID (USA). Dept. of Chemical Engineering). pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Pressure gradients and secondary flow fields generated by the passage of electrical current in a d.c. gas discharge or gas laser are topics of longstanding interest in the gaseous electronics literature. These hydrodynamic effects of space charge fields and charged particle density gradients have been principally exploited in the development of gas separation and purification processes. In recent characterization studies of fixed-bed and fluidized-bed plasma reactors several anomalous flow features have been observed. These reactors involve the contacting of a high-frequency, resonantly-sustained, disperse gas discharge with granular solids in a fixed or fluidized bed. Anomalies in the measured pressure drops and fluidization velocities have motivated the development of an appropriate theoretical approach to, and some additional experimental investigations of electrophoretic effects in disperse gas discharges. In this paper, a theory which includes the effects of space charge and diffusion is used to estimate the electric field and charged particle density profiles. These profiles are then used to calculate velocity fields and gas flow rates for monolith, fixed-bed, and fluidized-bed reactors. These results are used to rationalize measurements of gas flow rates and axial pressure gradients in high-frequency disperse gas discharges with and without an additional d.c. axial electric field.

29770 **Microwave absorption diagnostics on the MTX Tokamak.** Meassick, S. (Lawrence Livermore National Lab., CA (USA)); Hooper, E.B.; Rice, B.; Stallard, B.; Brooksby, C.; Veboncover, J.; Marinak, M.; Lorbeck, J. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). DOE Contract W-7405-ENG-48. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The microwave Tokamak Experiment (MTX) is designed to investigate nonlinear Electron Cyclotron Heating (ECH) heating resulting from short, high-power, microwave pulses incident upon a high-density ($10^{14}cm^{-3}$) and high temperature (1 keV) Tokamak plasma. The Free Electron Laser (FEL) used to supply the microwave pulses will initially operate in a single pulse mode at a frequency of 140 GHz with pulse lengths of approximately 20 ns at a power of 1 - 2 GW. Ultimately the FEL will supply pulse trains consisting of 50 pulses of 50 ns duration at a power of 8 GW. The energy supplied by the FEL pulse ($\approx$ 40 J) is small compared with the stored energy of the plasma ($\approx$ 2500 J) making it difficult to elevate the beam-plasma interaction by measuring bulk plasma parameters for these initial experiments.

29771 **Time resolved XUV spectroscopy from highly ionized capillary discharges.** Rocca, J.J. (Colorado State Univ., Fort Collins, CO (USA). Dept. of Electrical Engineering); Marconi, M.C.; Muniz, M.V.; Beethe, D.C.; Schmerge, J.F. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). Grant ECS-8606226. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Pulsed capillary discharges can produce highly ionized plasmas and have been used as spectroscopic sources in the study of multiple ionized species and in the generation of X-ray radiation. The authors proposed the use of a fast capillary discharge plasma as a medium for the amplification of extreme ultraviolet radiation following electron ion recombination. They have made time resolved measurements of the axial emission from capillary plasmas 500 μ, in diameter and several cm in length excited by short (50-100 ns FWHM) discharge pulses. The use of a gated dual plate intensified array detector provides the sensitivity required to obtain extreme ultraviolet spectra with 5 ns resolution in a single discharge shot using a 1 m focal length vacuum spectrograph. Analysis of the axial spectra from a 500 μ m diameter lithium hydride capillary shows simultaneous line emission from highly ionized (LiIII, OVI) and single ionized (OII) species. The data indicates the existence of a hot core plasma surrounded by a significantly cooler plasma near the walls.

29772 **Propagation of high power microwave pulses in the air.** Kuo, S.P. (Polytechnic Univ., Farmingdale, NY (USA). Weber Research Inst.); Zhang, Y.S. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). Grant AFOSR-85-0316. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The authors report on the propagation of high power microwave pulses through the air. The dynamic behavior of the pulse propagation depends on the intensity, frequency, and width of the pulse and subjects to the physical processes occurred during the interaction of the pulse with the air. In particular, air breakdown through interaction produces ionization phenomena that can radically modify wave propagation. Ionization gives rise to a space-time dependent plasma which attenuates the tail of the pulse but hardly

affects the leading edge because of the finite time for the plasma to build up. A mechanism which is called tail erosion plays the primary role in limiting transmission of pulse. Moreover, the nonlinear and non-local effects brought about by the space-time dependent plasma also play important roles in determining the propagation characteristics of the pulse. An experiment effort to single out these characteristics is discussed.

29773 Bragg scattering of EM Waves by microwave produced periodic plasma layers. Zhang, Y.S. (Polytechnic Univ., Farmingdale, NY (USA). Weber Research Inst.); Kuo, S.P. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, New York, NY (USA) (1989). Grant AFOSR-85-0316. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Uses of artificial plasma layers as Bragg reflectors for applications in telecommunication links and over-the-horizon (OTH) radars are investigated in a large chamber made of 2 feet cube of plexiglass. In this experiment, two microwave beams at right angles to each other are directed through the S-band horns into the chamber containing air at a pressure comparable to the upper atmosphere (~ 50 Km). Inside the chamber, the microwave beams produce a series of equally spaced plasma layers parallel to the plane bisecting the two beams. A third beam is then incident onto the plasma layers and the reflected signal is collected for analysis. In this experiment, the microwave power for plasma generation is produced by a single magnetron tube with 1 MW peak output power at a frequency of 3.2 GHz. A sweep microwave generator (4-8 GHz) is used to generate a test wave which is incident into the chamber through a C-band horn. The experiment results are found to agree well with the theory.

29774 Characterization of aluminum x-pinch plasmas driven by the 0.5 TW Lion accelerator. Qi, N. (Cornell Univ., Ithaca, NY (USA). Lab. of Plasma Studies); Hammer, D.A.; Kalantartar, D.H.; Noonan, W.A.; Rondeau, G.; Workman, J.B.; Richardson, M.C. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). contract NOOO14-85-K-0212. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The x-pinch, obtained by crossing two fine wires at one or more points as the load for the 0.5 TW Lion accelerator, has been used as a bright x-ray source. High density and temperature hot spots are observed at the crossing point(s). From these hot spots, an intense, spatially confined burst of x-rays is emitted which can serve as a pump for resonant photo-pumping lasers. The authors present experimental results concerning the radiation emission using Al x-pinches. The optimum mass loading for different ionization stages of Al ions and the total x-ray energy yields are examined. The density and temperature of the plasma and the size of the hot spots are measures. Based upon the results of these experiments, the authors evaluate resonant photopumping schemes such as those involving Be-like ions, using the Al x-pinch emission as the pump source.

29775 X-ray gated images of imploding microballoons. Brandley, D.K. (Rochester Univ., NY (USA). Lab. for Laser Energetics); Delettrez, J.; Jaanimagi, P.A.; Marshall, F.J.; Verdon, C.P.; Kilkenny, J.D.; Bell, P. pp. 354 of High speed photography, videography, and photonics VI. Stradling, G.L. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). DOE Contract FC08-85DP40200. (CONF-8808220–: High speed photography, videography, and photonics VI, San Diego, CA (USA), 15-17 Aug 1988).

Report on a four-frame, fast gated microchannel plate x-ray detector used on the OMEGA laser system to obtain two-dimensional, time-resolved pinhole camera images (in the 1-2.5 keV region) of imploding laser fusion targets. The camera, which frame has a frame time less than 150 ps has proven to be a valuable tool, both in recording implosion dynamics and in detecting and identifying implosion non-uniformities.

29776 Characterization of gated microchannel plate x-ray imaging systems. Power, G. (Lawrence Livermore National Lab., CA (USA)); Bell, P. pp. 354 of High speed photography, videography, and photonics VI. Stradling, G. L. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). DOE Contract W-7405-ENG-48. (CONF-8808220–: High speed photography, videography, and photonics VI, San Diego, CA (USA), 15-17 Aug 1988).

Gated X-ray microchannel plate detectors and images have become very useful and reliable diagnostics on Nova. The authors have characterized these stripline instruments with respect to gain, temporal and spatial resolution. Pulse shapers (2 kV - 100 ps) and improvements in pulse propagation allow us to gate x-ray events at 100 ps. They describe new ideas in diagnostics and new methods of improving temporal resolution (<100 ps).

29777 Nanosecond framing photography for laser-produced interstreaming plasmas. McLean, E.A. (Science Applications International Corp., McLean, VA (USA)); Ripin, B.H.; Stamper, J.A.; Manka, C.K.; Peyser, T.A. pp. 354 of High speed photography, videography, and photonics VI. Stradling, G.L. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). (CONF-8808220–: High speed photography, videography, and photonics VI, San Diego, CA (USA), 15-17 Aug 1988).

Using a fast-gated (120 psec-5 nsec) microchannel-plate optical camera (gated optical imager), framing photographs have been taken of the rapidly streaming laser plasma (~ 5×10^7 cm/sec) passing through a vacuum or a background gas, with and without a magnetic field. Observations of Large-Larmor-Radius Interchange Instabilities are presented.

29778 Dilatation dissipation: The concept and application in modeling compressible mixing layers. Zeman, O. (Center for Turbulence Research, Stanford University, Stanford, California 94305-3030 (US)). *Physics of Fluids A (USA)*, 2(2): 178-188 (Feb 1990). DOE Contract AC02-78ET51013.

In this paper a concept of dilatation dissipation ϵ_d for high Reynolds number compressible turbulence is introduced. The concept is predicated on the existence of shocklike structures embedded within energetic turbulent eddies. A parametric expression for ϵ_d is found that contains calculable parameters of a turbulent field: turbulence energy and length scale, rms (turbulent) Mach number, and the kurtosis of the fluctuating velocity. The dilatation dissipation is incorporated in a second-order closure model for compressible mixing layers and model predictions of mean and turbulence quantities are presented and, where possible, compared with experiments. It is shown that the model is capable of predicting the reduction of layer growth rates as a function of the convective Mach number M_c in accordance with Papamoschou–Roshko experiments; the computations are also shown to compare well with available measurements of Reynolds stresses at M_c=0.5–0.86. Finally, the physical implications of the new model and results obtained are discussed and compared with other existing explanations of the Mach number effect on mixing layer dynamics.

29779 Whistler instability in an electron-cyclotron-resonance-heated, mirror-confined plasma. Garner, R.C. (Plasma Fusion Center, Massachusetts Insitute of Technology, Cambridge, Massachusetts 02139 (US)); Mauel, M.E.; Hokin, S.A.; Post, R.S.; Smatlak, D.L. *Physics of Fluids B (USA)*, 2(2): 242-252 (Feb 1990). DOE Contract AC02-78ET51013.

The warm-electron-driven (2 keV) whistler electron microinstability [Phys. Rev. Lett. **59**, 1821 (1987)] of the Constance *B* electron-cyclotron-resonance-heated (ECRH), quadrupole mirror-confined plasma experiment has been studied. Experiments show (i) that the instability comes in fairly regular bursts on axis and continuously in time off axis due to the minimum-*B* geometry, (ii) a frequency spectrum that is insensitive to changes in the plasma parameters, and (iii) instability-induced power losses which are not greater than 10% of the ECRH power input for the regimes studied. A linear perturbation analysis of the relativistic Vlasov equation together with Maxwell's equations has been made. Using the ECRH distribution function, a new distribution function well suited for describing ECRH, mirror-confined plasmas, the analysis shows the instability frequency spectrum to be insensitive to changes in cyclotron frequency, temperature, and density, in agreement with experimental results, and only sensitive to changes in ECRH frequency.

29780 Emission of ion and electron cyclotron harmonic radiation from mode conversion layers. Cho, S. (Department of Physics, Auburn University, Auburn, Alabama 36849 (USA)); Swanson, D.G. *Physics of Fluids B (USA),* 2(2): 235-241 (Feb 1990). DOE Contract FG05-85ER53206.

The asymmetry of cyclotron radiation from a mode conversion layer is presented for harmonics of the ion cyclotron frequency and the second harmonic of the electron cyclotron frequency for weakly relativistic electrons. The same form of Kirchhoff's law is found for all cases, relating the emission along each branch to the absorption of an incident wave along the corresponding branch. Results show that the fast wave radiation is more strongly asymmetric at the third harmonic than at the second harmonic of the ion cyclotron frequency, while the slow wave radiation ratio is about same. At the second cyclotron harmonic of weakly relativistic electrons, the asymmetry of radiation is found to be small at high temperature. The effect of equilibrium Bernstein wave radiation is also discussed.

29781 Theory of neoclassical pressure-gradient-driven turbulence. Kwon, O.J. (Institute for Fusion Studies, The University of Texas at Austin, Austin, Texas 78712 (USA)); Diamond, P.H.; Biglari, H. *Physics of Fluids B (USA),* 2(2): 291-301 (Feb 1990). DOE Contract FG05-80ET53088;FG03-88ER53275.

The nonlinear evolution and saturation of neoclassical pressure-gradient-driven turbulence (NPGDT), evolving from linearly unstable bootstrap-current modes, are investigated. The theoretical model is based on "neoclassical magnetohydrodynamic (MHD) equations" that are valid in the banana-plateau regimes of collisionality. Modes with poloidal wavelengths shorter than radial wavelengths are shown to be suppressed. From nonlinear saturation conditions, the turbulent pressure diffusivity is determined as an eigenvalue of the renormalized equations. Levels and radial scales of turbulence are determined from the pressure diffusivity and are shown to exceed mixing-length estimates by powers of a nonlinear enhancement factor. The problem of the electron heat transport resulting from stochastic magnetic fields driven by NPGDT is revisited. The reconsideration of the radial structure of magnetic flutter leads to estimates of the electron heat transport and magnetic fluctuation levels that differ qualitatively and quantitatively from previous calculations.

29782 Auxiliary heated detached plasmas in tokamaks. Guzdar, P.N. (Laboratory for Plasma Research, University of Maryland, College Park, Maryland 20742 (US)); Liu, C.S. *Physics of Fluids B (USA),* 2(2): 324-328 (Feb 1990).

Earlier studies on Ohmically heated plasmas have been extended to auxiliary heated detached plasmas in tokamaks. Assuming the electron energy loss channel to be the dominant one and caused by η_e modes, the effect of auxiliary power in determining the thermal equilibria of detached plasmas is examined. Specific predictions for central electron temperature, core plasma radius, and electron energy confinement time as a function of the auxiliary power for the tokamak fusion test reactor (TFTR) [J. Nucl. Mater. **145**, 186 (1987)] parameters are obtained. Density limit enhancement by auxiliary power is also studied.

29783 Anisotropic distribution function of minority tail ions generated by strong ion-cyclotron resonance heating. Chang, C.S. (Courant Institute of Mathematical Sciences, New York University, 251 Mercer Street, New York, New York 10012 (USA)); Colestock, P. *Physics of Fluids B (USA),* 2(2): 310-317 (Feb 1990). DOE Contract AC02-76CH03073;FG02-86ER53223.

The highly anisotropic particle distribution function of minority tail ions driven by ion-cyclotron resonance heating at the fundamental harmonic is calculated in a two-dimensional velocity space. It is assumed that the heating is strong enough to drive most of the resonant ions above the ion–electron critical slowing-down energy. Simple analytic expressions for the tail distribution are obtained for the cases when the bounce-averaged quasilinear heating coefficient D_b is assumed to be constant in pitch angle and energy, when the Doppler effect is sufficiently large to flatten the sharp pitch angle dependence in D_b but the energy dependence is allowed, and when the sharp pitch angle dependence is retained. It is found that a simple constant-D_b solution can be used instead of the more complicated velocity-dependent-D_b solutions for many analytic purposes.

29784 Toroidal microinstability studies of high-temperature tokamaks. Rewoldt, G. (Princeton Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08543 (USA)); Tang, W.M. *Physics of Fluids B (USA),* 2(2): 318-323 (Feb 1990). DOE Contract AC02-76CH03073.

Results from comprehensive kinetic microinstability calculations are presented, showing the effects of toroidicity on the ion temperature gradient mode and its relationship to the trapped-electron mode in high-temperature tokamak plasmas. The corresponding particle and energy fluxes have also been computed. It is found that, although drift-type microinstabilities persist over a wide range of values of the ion temperature gradient parameter $\eta_i \equiv (d \ln T_i/dr)/(d \ln n_i/dr)$, the characteristic features of the dominant mode are those of the η_i-type instability when $\eta_i > \eta_{ic} \sim 1.2$–$1.4$ and of the trapped-electron mode when $\eta_i < \eta_{ic}$.

29785 Electron cyclotron resonance heating in tandem-mirror end cells. Rognlien, T.D. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550 (USA)); Matsuda, Y.; Stallard, B.W.; Stewart, J.J. *Physics of Fluids B (USA),* 2(2): 338-352 (Feb 1990). DOE Contract W-7405-ENG-48.

A relativistic Fokker–Planck code is used to study the formation of non-Maxwellian electron velocity distributions in the end cell of a tandem mirror from the combined effects of Coulomb collisions and electron cyclotron radio-frequency (rf) heating. Axial electrostatic potential profiles consistent with thermal-barrier operation are assumed which lead to reasonable electron density profiles. The presence of the potentials results in four populations of electrons occupying different regions of phase space, three of which are solved for self-consistently; the fourth is the passing electron distribution from the center cell that is fixed as a Maxwellian. It is found that the second-harmonic barrier rf near the bottom of the magnetic well, together with rf cavity fields, give a good correspondence to the behavior of the hot electrons in the TMX-U experiment [IEEE Trans. Plasma Sci. **PS-16**, 1 (1988)]. The behavior of the fundamental rf in the plug region part way up the magnetic well shows poor correlation with experimental results.

29786 Resistive evolution of magnetic fields in plasmas. Miller, G. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545 (US)); Faber, V.; White, A.B. Jr. *Journal of Computational Physics (USA),* 85(2): 323-341 (Dec 1989).

In resistive evolution a quasistatic plasma is assumed to be in mechanical equilibrium at every instant of time. Equilibria are determined, in part, by magnetic flux constraints. The evolution of these flux constraints depends only on the electric field parallel to the magnetic field, as given by Ohm's law. The use of a new, magnetic-vector-potential formalism for the resistive evolution problem is discussed. This formalism has advantages of generality and simplicity as well as providing greater numerical accuracy in certain cases (such as the evolution of a magnetic island) where artificial singularities occur when using magnetic surface variables. Sample calculations of the evolution of a strongly driven (pinch) discharge with cylindrical symmetry and of the nonlinear growth of a helically symmetric m=2 magnetic island in the Rutherford regime are given. © 1989 Academic Press, Inc.

29787 A general concurrent algorithm for plasma particle-in-cell simulation codes. Liewer, P.C. (Jet Propulsion Laboratory, California Institute of Technology, Pasadena, California 91109 (USA)); Decyk, V.K. *Journal of Computational Physics (USA),* 85(2): 302-322 (Dec 1989). DOE Contract FG03-85ER25009;FG03-84ER53173.

We have developed a new algorithm for implementing plasma particle-in-cell (PIC) simulation codes on concurrent processors with distributed memory. This algorithm, named the general concurrent PIC algorithm (GCPIC), has been used to implement an electrostatic PIC code on the 33-node JPL Mark III Hypercube parallel computer. To decompose at PIC code using the GCPIC algorithm, the physical domain of the particle simulation is divided into subdomains, equal in number to the number of processors, such that

all sub-domains have roughly equal numbers of particles. For problems with non-uniform particle densities, these sub-domains will be of unequal physical size. Each processor is assigned a sub-domain and is responsible for updating the particles in its sub-domain. This algorithm has led to a a very efficient parallel implementation of a well-benchmarked 1-dimensional PIC code. The dominant portion of the code, updating the particle positions and velocities, is nearly 100% efficient when the number of particles is increased linearly with the number of hypercube processors used so that the number of particles per processor is constant. For example, the increase in time spent updating particles in going from a problem with 11,264 particles run on 1 processor to 360,448 particles on 32 processors was only 3% (parallel efficiency of 97%). Although implemented on a hypercube concurrent computer, this algorithm should also be efficient for PIC codes on other parallel architectures and for large PIC codes on sequential computers where part of the data must reside on external disks. © 1989 Academic Press, Inc.

29788 Poloidal rotation velocities in the outer half of Alcator-*C* plasmas. Benjamin, R.D. (Department of Physics and Astronomy—The Johns Hopkins University, Baltimore, Maryland 21218 (USA)); Terry, J.L.; Moos, H.W. *Physical Review, A (General Physics) (USA)*, 41(2): 1034-1040 (15 Jan 1990). DOE Contract AC02-76ET53006.

Poloidal rotation velocities in the outer half of ohmically heated Alcator-*C* plasmas have been determined from the Doppler shift of impurity emission lines. The measurements were made using a high-resolution photon-counting detector, sensitive to wavelengths from ~1200 to ~2000 Å, mounted in the exit plane of a 1-m Ebert-Fastie spectrometer. The following transitions were used: $2s2p^1P^0_1$–$2p^2\ ^1D_2$ at 1371.292 Å in O V, $2s\ ^2S_{1/2}$–$2p^2P^0_{1/2}$ at 1242.804 Å in N V (both of which exist near the limiter radius in Alcator-*C*), and $1s2s\ ^3S_1$–$1s2p\ ^3P^o_2$ at 1623.63 Å in O VII (which exists at r/a~0.8). The measured rotation velocities are $4–5\times10^5$ cm/s in the direction of the electron diamagnetic drift at the radius of the O V emission shell and $\sim6\times10^5$ cm/s at the radius of the O VII emission shell, again in the electron diamagnetic drift direction. Therefore poloidal rotation of the outer half of the Alcator-*C* plasma with a velocity of several times 10^5 cm/s in the direction of the electron diamagnetic drift is firmly established by these measurements.

29789 Effects of autoionizing resonances on density-sensitive spectral-line intensity ratios in high-temperature plasmas. Jacobs, V.L. (Condensed Matter and Radiation Sciences Division, Code 4694—Naval Research Laboratory, Washington, D.C. 20375-5000 (USA)); Hagelstein, P.L.; Chen, M.H.; Minner, R. *Physical Review, A (General Physics) (USA)*, 41(2): 1041-1057 (15 Jan 1990).

We present the results of detailed calculations for the intensity ratios between magnetic-quadrupole and electric dipole radiations that are emitted in the $3p^5$3d→$3p^6$ transitions from highly ionized argonlike ions with nuclear charges in the range $26\leq Z\leq70$. In arriving at our theoretical predictions, the population densities of the radiating $3p^5$3d singly excited fine-structure levels were determined by the application of a collisional-radiative equilibrium model, in which we have systematically and self-consistently incorporated the results of fully relativistic multiconfiguration calculations for the atomic energy-level structure and for the elementary atomic collision and radiation rates. In the determination of the population densities of the $3p^5$3d singly excited fine-structure levels, we have investigated the role of indirect processes involving the $3p^54l4l'$ intermediate autoionizing resonances and the $3p^43d^2$ doubly excited bound states.

29790 Equation of state of the one-component plasma derived from precision Monte Carlo calculations. Stringfellow, G.S. (Lick Observatory, Board of Studies in Astronomy and Astrophysics—University of California, Santa Cruz, California 95064 (USA)— Institute of Geophysics and Planetary Physics—Lawrence Livermore National Laboratory, Livermore, California 9 *Physical Review, A (General Physics) (USA)*, 41(2): 1105-1111 (15 Jan 1990). DOE Contract W-7405-ENG-48.

Analytical fits to the one-component plasma (OCP) equation of state have been derived for internal energies that have reduced all *N*-dependent effects to within the statistical uncertainties introduced by the Monte Carlo computational process, which themselves are very small. Values of $N\gtrsim500$ adequately represent the thermodynamic limit. Using the fluid internal energies for only N=686, various analytical fits are generated, compared, and discussed. The thermal energy is accurately represented by a simple power-series fit with the leading term given by $\Gamma^{1/3}$, but also requires a small correction to the bcc Madelung term that brings that coefficient down to nearly −0.9, the value derived for hypernetted-chain theory. The fluid thermal energy data are reproduced to better than 0.2% over all Γ by our fit(s). The solid phase requires *both* anharmonic terms to be included in the fit, implying that the previous justification for dropping the first anharmonic correction is unwarranted. The location of the fluid-solid phase transition utilizing these new fits yields Γ_{bcc}=178 and Γ_{fcc}=192.

29791 Irradiation of LWIR detectors with x-rays generated near the sample. Flesner, L.D. (Naval Ocean Systems Center, San Diego, CA (US)); O'Brien, M.E.; Rogers, C.G.; Moore, T.G. *IEEE Transactions on Nuclear Science (Institute of Electrical and Electronics Engineers) (USA)*, 36(6): 1920-1925 (Dec 1989). (CONF-890723–: 26. annual conference on nuclear and space radiation effects, Marco Island, FL (USA), 25-29 Jul 1989).

An approach for testing the effects of ionizing radiation on long-wavelength infrared (LWIR) detectors operating in a thermally-shielded environment is described. An electron beam is introduced into a cryogenic chamber and used to generate low-energy X-rays in a cold target foil proximate to the detector. Applications of the method include ionization induced noise and accumulated dose studies.

fueling; cryogenics; commercial reactors; shielding; and design and performance. (LSP)

29794 (CONF-900602–2) **Cleanup and improvement of operational performance of ATF [Advanced Toroidal Facility] by chromium and titanium gettering.** Isler, R.C.; Bigelow, T.S.; Crume, E.C.; England, A.C.; Glowienka, J.C.; Horton, L.D.; Jernigan, T.C.; Langley, R.A.; Lyon, J.F.; Mioduszewski, P.K. Oak Ridge National Lab., TN (USA). [1990]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 17. European conference on controlled fusion and plasma heating; Amsterdam (Netherlands); 25-29 Jun 1990. Order Number DE90009827. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Several improvements have been realized recently in the performance of the Advanced Toroidal Facility (ATF). These have been achieved largely because of expanded employment of chromium and titanium gettering, as opposed to the earliest wall conditioning efforts that relied solely on glow discharge cleaning and baking. Spectroscopic analysis indicates that radiation decreases from as much as 75% to about 25% of the input power between nongettered operation and operation when approximately 70% of the vacuum vessel walls are covered with titanium. Nevertheless, the most important contribution of gettering appears to be the reduction of recycling and of hydrogen evolved from the walls during a discharge, thereby permitting better control of the gas fueling rate. As a result, operational procedures have been developed that allow much higher densities to be obtained than those reached without gettering. The maximum stored energy, confinement time, and line averaged density obtained in ATF to date are: 28 kJ, 25 ms, and 1.2×10^{14} cm^{-3}. In addition, quasisteady operation during neutral beam injection (NBI) into high-density plasmas has been achieved without the evolution to collapse which characterizes the low-density discharges. This paper describes the changes of impurity radiation effected by gettering and compares the behavior of low-density and high-density plasmas when titanium films are deposited over 50% or more of the vacuum vessel walls. 2 refs., 2 figs., 1 tab.

29795 (CONF-900602–4) **Development of fast-wave ICRF [ion cyclotron range of frequencies] current drive systems at ORNL.** Goulding, R.H.; Baity, F.W.; Batchelor, D.B.; Hoffman, D.J.; Jaeger, E.F.; Mayberry, M.J.; Ryan, P.M. Oak Ridge National Lab., TN (USA). [1990]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 17. European conference on controlled fusion and plasma heating; Amsterdam (Netherlands); 25-29 Jun 1990. Order Number DE90009818. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A series of proof-of-principle fast-wave current drive (FWCD) experiments in the ion cyclotron range of frequencies (ICRF) will begin soon on the DIII-D tokamak at General Atomics. These experiments will use a four-strap, 2-MW phased antenna array designed and built at Oak Ridge National Laboratory (ORNL). The antenna array will operate at a frequency of 60 MHz and is expected to drive currents at 0.25 to 0.5 MA in moderate-density ($\bar{n}_e \sim 1.3 \times 10^{19}$ m^{-3}) plasmas with $T_{e0} \sim 4$ keV and a toroidal field $B = 1$ T. We discuss development work undertaken at ORNL to predict the performance of the phased array and its feed circuit and to assist in the design of future FWCD systems. 6 refs., 5 figs.

29796 (CONF-900623–3) **Vanadium alloys with improved resistance to helium embrittlement.** Braski, D.N. Oak Ridge National Lab., TN (USA). [1990]. 34p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 15. symposium on effects of radiation on materials; Nashville, TN (USA); 17-21 Jun 1990. Order Number DE90009811. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A series of experimental vanadium alloys have been designed with small MC-type carbides in their microstructures to trap helium produced during neutron irradiation, thereby reducing helium embrittlement. The tensile properties and fabricability of the alloys were strongly influenced by the amounts of MC-forming-elements, especially carbon. Alloys with 0.05 and 0.10 wt % carbon exhibited slightly lower yield strengths at 420 to 600°C than vanadium alloys such as V-5Cr-5Ti, Vanstar-7, V-3Ti-1Si, and V-15Cr-5Ti. However, this characteristic may actually be an asset from the standpoint of resistance to irradiation hardening. After implantation with 300 appm ^3He, both the V-Ti-C and V-Ti-Zr-C alloys exhibited less ductility losses at 600°C than the other vanadium alloys tested under comparable conditions. Examination of the experimental alloy microstructures by AEM showed that the small MC-type carbides did, in fact, trap helium and that they were responsible for the increased resistance to helium embrittlement of these alloys. 16 refs., 12 figs., 2 tabs.

29797 (CONF-9003116–1) **Pellet injection into ATF plasmas.** Wilgen, J.B. (Oak Ridge National Lab., TN (USA)); Bell, J.D.; England, A.C.; Fisher, P.W.; Howe, H.C.; Murakami, M.; Rasmussen, D.A.; Richards, R.K.; Uckan, T.; Wing, W.R. Oak Ridge National Lab., TN (USA). [1990]. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (CONF-9003117–1: US-USSR exchange visit to Kharkov Physico-Technical Institute seminar; Experiments on the Wendelstein VII-AS and ATF stellerators seminar; US-USSR exchange visit to Institute of General Physics seminar, Kharkov (USSR); Munich (Germany, F Order Number DE90009229. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Based on the favorable empirical scaling of stellarator confinement with increasing electron density, pellet fueling is expected to result in significant performance improvement of the ATF plasma. With gas-puff fueling, NBI heated plasmas in ATF are limited by a thermal collapse. Pellet fueling provides a potential means to delay this effect and gain access to the favorable high density confinement regime. To provide flexibility for optimization and physics studies, eight different pellet sizes are available. To date, line average densities of up to 4×10^{13} cm^{-3} have been achieved with a single pellet injected into a 0.7 MW NBI plasma at 0.95 T; the results from optimization studies with up to 1.5 MW of NBI power at 2 T will be presented.

29798 (CONF-9006162–2) **Test methods for evaluating hot cracking: Review and perspective.** Goodwin, G.M. Oak Ridge National Lab., TN (USA). [1990]. 26p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (CONF-9006149–2: 1. U.S.-Japan symposium on advances in welding metallurgy; 1. United States - Japan symposium on advances in welding metallurgy, Yokohama (Japan); San Francisco, CA (USA), 12-13 Jun 1990; 7-8 jun 1990). Order Number DE90009820. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The phenomenon of hot cracking is described and discussed, and criteria for tests to assess hot cracking are elucidated. The historical development of hot cracking tests is traced from the 1930s to present, with categorization of tests into several types. It is noted that the number of tests developed continues to increase dramatically. The number of literature citations also increases with time, with few popular tests receiving a major share of interest. Predominant countries of origin of both tests and citations shift with time, and a few journals account for most of the published information. Reviews of hot cracking are reviewed, and it is predicted that modeling and other developing analytical techniques will contribute greatly to an increase in our understanding of hot cracking. 30 refs., 10 figs., 1 tab.

29799 (DOE/ER/52161–1) **Corrosion studies of a stainless steel structure for the ITER [International Thermonuclear Experimental Reactor] aqueous lithium salt blanket concept: Technical progress report.** Duquette, D.J.; Wrisley, K.L.; Motyka, E.; Steiner, D.; Embrechts, M.J. Rensselaer Polytechnic Inst., Troy, NY (USA). Mar 1990. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER52161. Order Number DE90009925. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The aqueous lithium salt blanket (ALSB) employs water, with a dissolved lithium compound, as both the coolant and tritium breeding medium. The ALSB concept is one of three blanket options currently being examined for breeding tritium in the International Thermonuclear Experimental Reactor (ITER). To provide data and recommendations for materials and chemistry selection relevant to application of the ALSB in ITER, corrosion studies have been initiated, focusing on Type 316 stainless steel in lithium hydroxide and lithium nitrate solutions. This report presents the preliminary results of these corrosion studies. 4 refs., 9 figs., 1 tab.

29800 (IPP–III/139, pp. 34-39) **ASDEX edge and divertor simulation and the problem of incomplete and inaccurate experimental data.** Schneider, W.; Neuhauser, J.; Haas, G.; McCormick, K.; Tsois, N.; Wunderlich, R. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. In *ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988.* Order Number DE90780658. Available from NTIS (US Sales Only), PC A07/MF A01.

The one-dimensional hydrodynamic code SOLID coupled with the two-dimensional Monte Carlo neutral gas code DEGAS are used to simulate the scrape-off layer and divertor recycling region of the ASDEX tokamak. A numerical data base is created for the relevant parameter regime and compared to the limited amount of experimental data. A reasonable fit with ohmic data is obtained, assuming classical heat flow along field lines and allowing for varying divertor saturation. The problem of experimental errors on one side and deficiencies in the theoretical model on the other side are discussed. (orig.).

29801 (IPP–III/139, pp. 40-52) **Comparison of recycling in the ASDEX divertor before and after hardening.** Haas, G.; Poschenrieder, W.; Neuhauser, J.; Kaesdorf, S. ASDEX Team; NI Team. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. In *ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988.* Order Number DE90780658. Available from NTIS (US Sales Only), PC A07/MF A01.

The original ASDEX-divertor was not capable to dissipate the heat load of long pulse NBI and ICRH. In a partial reconstruction termed hardening, new water-cooled divertor components were installed. The modified divertor geometry resulted in some significant changes, e.g. in gas consumption and divertor pressure. Difficulties in obtaining a good H-mode are possibly connected to the modified recycling behaviour. However, a new regime with improved ohmic confinement (IOC) and reduced recycling is now found. (orig.).

29802 (JAERI-M–89-193) **Analysis of ICRF heating and current drive in ITER.** Fukuyama, Atsushi (Okayama Univ. (Japan). School of Engineering); Hamamatsu, Kiyotaka; Itoh, Sanae-I; Itoh, Kimitaka. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1989. 28p. (In Japanese). Order Number DE90777749. Available from NTIS (US Sales Only), PC A03/MF A01.

Feasible frequency range of ion cyclotron waves for heating and current drive in an ITER-grade tokamak are searched for and analyzed in detail. Key constraints of the choice are loading impedance, power partition to each plasma species (electron, deuteron, trition and α particles), radial deposition profiles and sensitivity to α particle population. Solving an integro-differential equation for the wave, we examine wave propagation and absorption in a wide range of frequency from less than ω_{cT} to more than $4\omega_{cT}$ (i.e., 10 MHz $\approx$ 100 MHz) for the plasma of D-T mixture. Looking for the frequency range insensitive to the absorption by α particles, we find that the frequency near $2\omega_{cT}$ (54 MHz) is suitable for current drive, though the drive efficiency is not so high. The frequency of ω_{cD} (39 MHz) and $2\omega_{cD} = 3\omega_{cT}$ (81 MHz) are also available for central heating. When $\omega < \omega_{cT}$, most of the power is absorbed by electrons; however, it its difficult to obtain stable antenna coupling owing to standing wave formation. (author).

29803 (JAERI-M–89-202) **Preliminary design of test facilities for tritium breeding blanket development, (1).** Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1989. 123p. (In Japanese). Order Number DE90777741. Available from NTIS (US Sales Only), PC A06/MF A01.

This report describes the results of the preliminary design of outpile test facilities which are used for development of tritium breeding blanket with ceramic breeding material. The facilities which were designed are as follows; High heat flux test facility, Thermal-hydraulic test facility, Integrity test facility, Fabrication Technology Development Facility. This design study was performed by Kawasaki Heavy Industries, Ltd. under the contract to Fusion Research System Laboratory. (author).

29804 (KFK–4677) **Nuclear fusion project. Semi-annual report of the Association KfK/Euratom. April 1989 - September 1989.** Kast, G. (comp.). Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Nov 1989. 101p. (EUR–11397-EN). Order Number DE90780228. Available from NTIS (US Sales Only), PC A06/MF A01.

Report on the technology program for NET: Plasma facing components, magnets, tritium fuel cycle, basic blanket, remote handling and maintenance, safety and environment, solid breeder and liquid metal test blankets, mechanical properties of pre- and post-irradiation of 1.4914 steel (MANET), ECRH power sources, NET study contracts. (HP).

29805 (N–90-15836, pp. 56-67) **Introduction to D-He(3) fusion reactors.** Vlases, G.C.; Steinhauer, L.C. National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center. Jul 1989. (NASA-TM–101652;NAS–1.15:101652). In *Report of NASA Lunar Energy Enterprise Case Study Task Force.* Available from NTIS, PC A09/MF A02.

A review and evaluation of D-He(3) fusion reactor technology is presented. The advantages and disadvantages of the D-He(3) and D-T reactor cycles are outlined and compared. In addition, the general design features of D-He(3) tokamaks and field reversed configuration (FRC) reactors are described and the relative merits of each are compared. It is concluded that both tokamaks and FRC's offer certain advantages, and that the ultimate decision as to which to persue for terrestrial power generation will depend heavily on how the physics performance of each of them develops over the next few years. It is clear that the D-He(3) fuel cycle offers marked advantages over the D-T cycle. Although the physics requirements for D-He(3) are more demanding, the overwhelming advantages resulting from the two order of magnitude reduction of neutron flux are expected to lead to a shorter time to commercialization than for the D-T cycle.

29806 (PPLK-R–39) **Summary of IAEA technical committee meeting on impurity control.** Itoh, Kimitaka. Kyoto Univ., Uji (Japan). Plasma Physics Lab. Mar 1989. 43p. Order Number DE90777731. Available from NTIS (US Sales Only), PC A03/MF A01.

Presentations given in the IAEA technical committee meeting on impurity control (held in JAERI from 13 to 15 February, 1989) are summarized, putting the emphasis on the physics modelling of the plasma related to the impurity production and confinement. (author).

29807 (PPLK-R–42) **Recent activity on Heliotron E physics study and engineering developments.** Obiki, T. (and others); Wakatani, M.; Sato, M. Kyoto Univ., Uji (Japan). Plasma Physics Lab. Jun 1989. 70p. Order Number DE90777728. Available from NTIS (US Sales Only), PC A04/MF A01.

Recent activity on Heliotron E physics study about transport, MHD stability, and divertor action with new equipments is summarized. For the above purpose, appropriate pellet injector and new diagnostics are developed. Moreover, research and developments about heating systems and the other new systems for the Large Helical Device are being carried out by the Heliotron group. (author).

29808 (PPLK-R–45) **Magnetic field near plasma boundary in toroidal helical systems.** Nagasaki, Kazunobu; Itoh, Kimitaka. Kyoto Univ., Uji (Japan). Plasma Physics Lab. Jul 1989. 38p. Order Number DE90777727. Available from NTIS (US Sales Only), PC A03/MF A01.

Magnetic field structure of the scrape off layer (SOL) region in toroidal helical systems is analyzed by using toroidal harmonic functions. The SOL region in toroidal helical systems is ergodic due to the toroidal effect. The connection length of the field line to the wall is calculated for various configurations. The connection length, L, has a logarithmic dependence on the distance from the outermost magnetic surface or from the residual magnetic islands, δ. The effect of axisymmetric fields on the field structure is also determined. The coefficient, $L/\ln\delta$, is weakly dependent on the toroidal field and is nearly independent of the vertical field. (author).

29809 (RTS-R–016) **The use of lithium oxide as the breeder in fusion reactors.** Dodd, J.A. (UKAEA Risley Technical Services, Risley (UK)); Baker, L.J.; Kennedy, P.; Challender, R.S.; Coast, G. UKAEA Risley Technical Services, Risley (UK). Jul 1989. 85p. Order Number DE90623638. Available from NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

Lithium oxide as a fusion blanket material has neutronic advantages but various design limitations. The study was undertaken to investigate the design implications, to demonstrate how the limitations can be overcome and to provide guidance for future development. The study included lithium oxide properties, tritium control, coolant chemistry, blanket engineering and blanket neutronics. (author).

29810 (SAND–89-1088) **Magnetic Fusion Energy Program: Annual report 1988.** Doyle, B.L. (Sandia National Labs., Albuquerque, NM (USA)); Whitley, J.B.; Wilson, K.L.; Garber, R.A. Sandia National Labs., Albuquerque, NM (USA). 1988. 104p. Sponsored by U.S. DOE Energy Research. DOE Contract AC04-76DP00789. Order Number DE90009521. Available from NTIS, PC A06/MF A01; OSTI; INIS; GPO Dep.

This report discusses the projects and device support for the following thermonuclear reactors: Tokamak Fusion Test Reactor, Compact Ignition Tokamak, International Thermonuclear Experimental Reactor, Joint European Torus, Textor, Tore-Supra, DIII-D, and ASDEX and ASDEX Upgrade. This paper also discusses High-Heat Flux Materials and Components and Plasma Surface Interactions Research.

29811 (UCRL–21203-Vol.2) **Theoretical studies and algorithm development for x-ray lasers: Volume 2: April–November 1989.** Hagelstein, P.L.; Kaushik, S.; Balents, L. Lawrence Livermore National Lab., CA (USA). Nov 1989. 88p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90010120. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This report describes the results of research on x-ray lasers performed for the Lawrence Livermore National Laboratory under LLNL subcontract BO48704 during the period April 1989 through November 1989. Additional effort through the report date is included in this document. We have been moderately successful in our efforts during the past year. Substantial improvements in the conjugate gradient algorithms have been made, both in efficiency and in robustness. We have obtained a key technical result in our DHF and self-energy studies, which may allow us to obtain a rigorous derivation of our heuristic formulas. We report progress in the modeling and design of the GaAs quantum well x-ray detector.

29812 (UCRL–50021-87) **Laser Program annual report 1987.** O'Neal, E.M.; Murphy, P.W.; Canada, J.A.; Kirvel, R.D.; Peck, T.; Price, M.E.; Prono, J.K.; Reid, S.G.; Wallerstein, L.; Wright, T.W. (eds.). Lawrence Livermore National Lab., CA (USA). Jul 1989. 669p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90008198. Available from NTIS, PC A99/MF A01 - OSTI; GPO Dep.

This report discusses the following topics: target design and experiments; target materials development; laboratory x-ray lasers; laser science and technology; high-average-power solid state lasers; and ICF applications studies.

29813 (UCRL-CR–103211) **Producing dense plasmas with x-rays.** Matthews, D. (Lawrence Livermore National Lab., CA (USA)); Trebes, J.C.; Falcone, R.; Da Silva, L.B. Lawrence Livermore National Lab., CA (USA). Mar 1990. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90009539. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Plasmas generated by x-ray irradiation rather than optical lasers achieve density and temperatures of interest to astrophysics, inertial confinement fusion and atomic physics. In the past year we have developed and characterized a facility capable of focusing broadband x-rays from a laser produced plasma to flux levels of $\approx 10^4$ J/cm^2. 2 figs.

29814 (WHC-SA–0693) **The design and performance of high-temperature irradiation capsules.** Greenslade, D.L.; Knight, R.C.; Ermi, A.M. Westinghouse Hanford Co., Richland, WA (USA). Mar 1990. 21p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-900623–1: 15. symposium on effects of radiation on materials, Nashville, TN (USA), 17-21 Jun 1990). Order Number DE90007822. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Characterization of high-temperature materials behavior in a neutron environment will be required to develop reliable performance prediction models for high-temperature gas-cooled, space power, and fusion reactors. One vehicle by which material behavior in a fast neutron environment can be studied is the Materials Open Test Assembly (MOTA) in the Fast Flux Facility (FFTF). Until recently, irradiation temperatures in the MOTA were limited to 1075 K. A recent successful experiment, however, has extended the temperature capability in the MOTA to 1500 K. This report describes the design and performance of high-temperature capsules that were used in that experiment. Each of eight uniquely designed instrumented capsules (which contained refractory metal specimens) operated at an irradiation temperature between 1290 and 1500 K. Temperatures within +/−10 K of target were maintained in seven of the eight capsules during the 335-day irradiation. Data obtained during the experiment clearly showed the advantages of having a temperature control system for high-temperature irradiation capsules. 7 refs., 6 figs., 1 tab.

29815 PC application in DIII-D neutral beam operation. Gladd, A.S. (GA Technologies, Inc., Oak Ridge, TN (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

An IBM PC/AT has been implemented to improve operation of the DIII-D neutral beams. The PC system provides centralization of all beam data with reasonable access for online shot-to-shot control and analysis. The PC hardware was configured to interface all four neutral beam host mini-computers, support multi-tasking, and provide storage for approximately one month's accumulation of beam data. The PC software is composed of commercial packages used for performance and statistical analysis (i.e. LOTUS 123, PC PLOT, etc.) host communications software (i.e. PCLINK, KERMIT, etc.) and applications developed software utilizing FORTRAN and BASIC. The objectives of this paper are to describe the implementation of the PC system, the methods of integrating the various software packages, and the scenario for online control and analysis.

29816 Fiber-optic control of the ZT-P experiment. Caudill, L.D. (Los Alamos National Lab., NM (USA)); Chandler, G.I.; Hall, C.R.; Trujillo, J.F. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The computer control system for the ZT-P experiment has been implemented using a fiber-optic link in all 161 control signal paths. Four classes of control signals are used in this design. These are: digital-out; an on-off signal from computer to machine actuator, digital-in, and on-off signal from machine sensor to computer, analog-out, a 0 - 10 volt analog signal from computer to machine actuator, analog-in, 0 to +1 milliampere analog signal from machine sensor to computer. The digital-in and the digital-out class of signals require no control power at the machine end. The analog-out and the analog-in class of signals use available machine power for control. This unique power arrangement and the use of fiber-optic links serve to totally isolate electrically noisy machine areas from the sensitive electronics in the computer control. Advantages, including low cost, small size, personnel safety, and ease of maintenance and modification are discussed.

29817 A general distributed control system for fusion experiments. Klingner, P.L. (Los Alamos National Lab., NM (USA)); Levings, S.J.; Wilkens, R.W. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton

Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report the development of a general control system using distributed LSI-11 microprocessors. Common software resides in each LSI-11 and is tailored to an application by control specifications downloaded from a host computer. The microprocessors, their control interfaces, and the micro-to-host communications are CAMAC based. The host computer also supports an operator interface, coordination of multiple microprocessors, and utilities to create and maintain the control specifications. Typical applications include monitoring safety interlocks as well as controlling vacuum systems, high voltage charging systems, and diagnostics.

29818 **MDS/MIT data system.** Fredian, T.W. (Massachusetts Inst. of Tech., Cambridge, MA (USA)); Stillerman, J.A. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

MDS is a high speed VAX based CAMAC oriented data acquisition and analysis system. It was developed for use on the ALCATOR-C and TARA experiments. MDS consists of a coherent set of general purpose, flexible tools for experimental data handling. Using MDS a scientist can set up a complete diagnostic including CAMAC data acquisition, display, and analysis without writing any code. The computer equipment on which MDS is installed ranges from large VAXclusters to small stand-alone MicroVAX II systems. The authors present an overview of the MDS system. They discuss planned improvements in the system, and discuss ideas for future enhancements that may benefit MDS sites.

29819 **The computer control and data acquisition system for the R. R. test facility.** Stewart, K.A. (ORNL (US)); Burris, R.D.; Mankin, J.B.; Thompson, D.H. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The radio frequency test facility (RFTF) at Oak Ridge National Laboratory, used to test and evaluate high power ion cyclotron resonance heating (ICRH) systems and components, is monitored and controlled by a multi-component computer system. The programmable controller (PLC) performs all the control functions of the test facility. The VAX computer acts as the operator's interface to the test facility by providing color mimic panel displays and allowing input via a trackball device. The VAX also provides archiving of trend data acquired by the PLC. Communications trend data acquired by the PLC. Communications between the PLC and the VAX are via the CAMAC serial highway. Details of the hardware, software, and the operation of the system are presented.

29820 **Design and implementation of a control system for deuterium pellet injector.** Burris, R.D. (ORNL (US)); Baylor, L.R.; Greenwood, D.E.; Stewart, K.A. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The Oak Ridge National Laboratory is currently developing a deuterium pellet injector for installation on the Tokamak Fusion Test Reactor (TFTR). This paper describes the design and development of a stand-alone data acquisition and control system for that device. Major elements of the hardware are described. The PLC performs all actual control actions and acquires data pertinent to those actions. The MicroVAX receives the data acquired by the PLC, displays it for the operator, prompts for and processes requests for action from the operator, and informs the PLCV of those requests. The primary purpose of this paper is to describe the software operating in the MicroVAX, including the system architecture, major tasks, and ancillary and background tasks.

29821 **The block transfer system: From conception through the first year of operation.** Bradish, G.J., III; Reid, A.E. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The central instrumentation control and data acquisition (CICADA) computer system is comprised of a functionally distributed hierarchical network of thirteen (13) 32-bit mini-computers that are the heart of the control, monitoring, data collection and data analysis for the tokamak fusion test reactor (TFTR). The CICADA system was designed with the goal of providing complete control, monitoring, and data acquisition for TFTR, which includes the acquisition and storage of 20M points of data within a five-minute shot cycle. It was realized early in the system design that in order to meet this goal an ancillary system would have to be provided to supplement the subsystem CAMAC systems that, due to the relatively slow throughput of the serial highways and the overhead of relaying data to the central facilities within a star network, would not provide the necessary throughput. The authors discuss how the block transfer system provided a means of moving data directly from the CAMAC crate to the application running on the central facility computers.

29822 **TFTR status and alarm system.** Drucker, L. (Princeton Univ., NJ (USA)); Fleming, G.; Sauthof, N.; Stark, W. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors report on the status and alarm system being implemented for TFTR to allow machine operators to be notified when conventional monitored values go into an alarm state. The system will allow the display of maintained points and alarms on any configured graphic output device. The displays may include calculated software points which represent the result of expressions involving the states of other points or groups of points. The calculated points are treated in a fashion identical to conventional points, allowing the utilization of existing program generation and access routines. The system permits operator notification of any change in the alarm states of a point or group of points on any selection of pages. In addition, the user can modify the alarm limits or the normal states of points on a page, by a command within that page.

29823 **Software development for TFTR.** Christianson, G. (Princeton Univ., NJ (USA)); Davis, W.; Diesso, M.; Lagin, L.; Malsury, J.; Matone, J.; Schectman, N.; Snyder, J.; Terpstra, T. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The development of software for the TFTR machine is discussed. Key problems in the development process are control of a large body of applications code and the provision of an environment that maximizes the productivity of the applications programmers. Control of the large body of code is accomplished through the use of a common method of software module specification, standard naming conventions, standard documentation, and automated utility programs to check the consistency of source code. The productivity of the applications programmers is enhanced by the presence of services providing graphics capabilities, terminal and user dialog management, data access, smoothing and compression, hardware device access and testing, and program execution tracing.

29824 **TFTR computer system graphics support.** Stark, W. (Princeton Univ., NJ (USA)); Chu, J. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Developments in the tokamak fusion test reactor (TFTR) computer graphics system in support of physics operations and diagnostic data reduction are described. There are approximately 170 graphics devices connected to the TFTR computer system via a serial CAMAC highway. The graphics support system permits these devices to be accessed via shared memory from any task

within the computer system configuration. The increase in the number of user station, as well as the sophistication of data reduction, has driven an increase in the requirement for graphics speed. The introduction of parallelism, multiple buffering, and no-wait processing has enabled rates of 800,000 points/minute to be supported. A shadowing feature has been added which allows the most recent plot for each screen to be stored on disk, and subsequently available to a spooling system which supports transmission of plot files to laser plotters and other devices based on interactive command.

29825 TFTR data management system. Randerson, L. (Princeton Univ., NJ (USA)); Chu, J.; Ludescher, C.; Malsbury, J.; Stark, W. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Developments in the tokamak fusion test reactor (TFTR) data management system supporting data management system supporting data acquisition and off-line physics data reduction are described. Data from monitor points, timing channels, and transient recorder channels and other devices are acquired and stored for use by on-line tasks. Files are transferred off-line automatically. A configuration utility determines data acquired and files transferred. An event system driven by file arrival activates off-line reduction processes. A post-run process transfers files not shipped during runs. Files are archived to tape and are retrievable by digraph and shot number. Automatic skimming based on most recent access, file type, shot numbers, and user-set protection maintains the files required for post-run data reduction.

29826 Software architecture for the ORNL large coil test facility data system. Blair, E.T. (ORNL (US)); Baylor, L.R. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The VAX based data acquisition system for the international fusion superconducting magnetic test facility (IFSMTF) at Oak Ridge National Laboratory (ORNL) is a second generation system that evolved from a PDP-11/60 based system used during the initial phase of facility testing. The VAX based software represents a layered implementation that provides integrated access to all of the data sources within the system, decoupling en-user data retrieval from various front-end data sources through a combination of software architecture and instrumentation data bases. Independent VAX processes manage the various front-end data sources, each being responsible for controlling, monitoring, acquiring, and disposing data and control parameters for access from the data retrieval software.

29827 The TMX~U computer system in evolution. Casper, T.A. (Lawrence Livermore National Lab., CA (USA)); Bell, H.; Brown, M.; Gorvad, M.; Meyer, W.; Mollen, J.; Perkins, D. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper reports how the TMX~U diagnostic data base has grown to 9 Mbytes with over 1300 channels; roughly triple the originally designed size. This acquisition and processing limits the repetition rate to about 10 min per shot using the five original HP-1000 computers with shared disks. The new diagnostics tend to be multichannel instruments, which can be more easily managed using local computers. HP-series 200 and 500 computers are being used for instrument control, data acquisition, and analysis. Eight such systems are operational with processed format output exchanged via a shared resource manager. The authors are presently implementing the necessary hardware and software changes to create a local area network allowing us to combine the data from these systems with our main data archive. The expansion of their diagnostic system using the parallel acquisition and processing concept allows them to increase their data base with a minimum impact on the experimental repetition rate.

29828 Software systems for processing and analysis of experimental data at the Nova laser facility. Auerbach, J.M. (Lawrence Livermore National Lab., CA (USA)); McCauley, E.W.; Stone, G.F.; Montgomery, D.S. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

A typical laser-plasma interaction experiment at the Nova laser facility produces in excess of 20 megabytes of digitized data. Extensive processing and analysis of this raw data from a wide variety of instruments is necessary to produce data that can be readily used to interpret the experiment. The authors describe how using VAX based computer hardware, a software system has been set up to convert the digitized instrument output to physics quantities describing the experiment. A relational data base management system is used to coordinate all levels of processing and analysis. Extensive data bases of instrument response and set-up parameters are used at all levels of processing and archiving. An extensive set of programs is used to handle the large amounts of X, Y, Z data recorded on film by the bulk of Nova diagnostics. Software development emphasizes structured design, flexibility, automation and ease of use.

29829 Summary of control and data acquisition systems for Nova based inertial confinement studies. McCauley, E.W. (Lawrence Livermore National Lab., CA (USA)); Auerbacl, J.M.; Montgomery, D.S.; Randolph, J.E.; Shaw, J. G.; Stone, G.F. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The Nova Laser has completed its first year of operation. During this period, emphasis has been placed on activation of the facility and of the numerous target and beam diagnostics. Two separate target chambers are in use. Nova operation is separated into two broad functions: laser operations and experiments. The operations group provides the laser system control, operation and data acquisition and the experiments group provides experiment definition, diagnostic instrumentation and overall data processing. This paper reports on the overall Operations side. VAX 11/780 computers are used to set up diagnostic operating parameters and collect data recorded by the CAMAC and CCD modules. These data are delivered in files by electronic link to the laser experiments and analysis facility (LEAF) VAX 11/785 of the experiments group for processing. Film data are digitized at LEAF and the film data files also processed on the LEAF VAX.

29830 Parametric study of electron density profile evolution following pellet injection in TFTR. Park, H.K. (Princeton Univ., NJ (USA)); Mansfield, D.K.; Johnson, L.C. pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Recent results from TFTR pellet experiments have extended previous results to a larger volume and longer time scales. In this paper, the detailed study of electron density profile response following pellet injection is discussed. In particular, hollow density profiles with relatively long relaxation time (10 $\sim$ 100 msec) from inverted gradient are obtained by injection of 2.67 mm diameter pellets, which penetrate to r $\simeq$ a/2. Strongly peaked profiles and central electron density - 2 x $10^{20}m^3$ are obtained by injection of a 4 mm diameter pellet, which penetrates to or beyond the magnetic axis. In both cases, the pellet mass is well accounted for by the measured density perturbation.

29831 Diagnostic control, data acquisition, and data processing at MFTF-B. Preckshot, G.G. (Lawrence Livermore National Lab., CA (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference

on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Diagnostic instruments at the Mirror Fusion Test Facility (MFTF-B) are operated by a distributed computer system which provides an integrated control, data acquisition, and data processing interface to the experimentalast. Instrument control settings, operator inputs and lists of data to be acquired are combined with data acquired by instrument data recorders, to be used downstream by data processing codes; data processing programs are automatically informed of operator control and setpoint actions without operator intervention. The MFTF-B distributed computing environment permits the authors to take advantage of several kinds of computing equipment and commercial software. The combined diagnostic control and results presentation interface is presented to experimentalast users by a network of high-resolution graphics workstations. Control coordination, data processing, and database management are handled by a shared-memory network of 32-bit super minicomputers. Direct instrument control, data acquisition, data packaging, and instrument status monitoring are performed by a network of dedicated local control microcomputers. A description of this system and the authors' experiences in implementing the first MFTF-B diagnostic instrument, the magnetic field alignment (MFA) diagnostic, are reported.

29832 TFTR CAMAC data acquisition system. Rauch, W.A. (Princeton Univ., NJ (USA). Plasma Physics Lab. (USA)). pp. 92 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Diagnostic data acquisition on Princeton's tokamac fusion test reactor (TFTR) is accomplished via CAMAC (computer automated measurement and control system). This paper describes the capabilities of this instrumentation technique as applied to TFTR diagnostics. The authors present the family of CAMAC modules and equipment necessary for TFTR data acquisition and process control. These modules provide system configuration that ranges from meeting the basic requirements of digital and analog input/output to the more exotic requirements afforded by special modules. The special modules include transient digitizers, scalars, histogrammers (each with add-on memory storage), timing and sequencing and time gate units, function generators, and microprocessor interface units. The authors describe the applications, guidelines, and recommendations that have directly evolved from system configurations based on their experience with TFTR CAMAC.

29833 Global resistance MHD calculations for high-beta DIII-D divertor tokamak. Lee, J.K. (General Atomics Co., San Diego, CA (USA)); Strait, E.J.; Lao, L.L.; Taylor, T.S. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Resistive MHD phenomena at high pressure or high current may cause magnetic fluctuations and determine various discharge limitations for tokamaks. The linear and nonlinear resistive MHD phenomena for finite-β (β is the ratio of plasma pressure to toroidal magnetic field energy) noncircular tokamak equilibria are studied using a 3-D initial value code CART. This code, employing Cartesian coordinate mesh, is particularly suited for treating noncirvular shapes, updown asymmetry, open field lines and a magnetic separatirix, all of which characterize realistic DIII-D single-null divertor discharges with high pressure or high current. More than two dozen magnetic signals calculated from inferred profiles show a good agreement with the measurements both in relative amplitudes and phases when the vacuum vessel is treated as conducting and its exact noncircular shape is taken into account. With a simple modeling of finite Larmor radius effect, these calculations suggest that the prevailing mode structure of the pressure-driven resistive mode might change from short to long wavelength (namely, from toroidal mode number n = 3 to n = 1) as the plasma pressure is increased, in accordance with experimental observation. The line-typing effect in terms of reduced resistivity in open field lines and the localized change in the interior resistivity due to local heating are found to have some weak effect on these global resistive MHD modes for the DIII-D plasmas. The effects of a magnetic separatrix and its x-point location are also examined.

29834 A compact and low power microwave ECR broad ion beam source for low pressure materials processing. Mahoney, L. (Michigan State Univ., East Lansing, MI (USA)); Asmussen, J. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Earlier work has demonstrated a multicusp, ECR ion cource concept using a seven-inch cavity applicator. However, many industrial and research applications desire a physically compact, long life and high current density broad beam ion source capable of operating with chemically active gases such as CF_4 and O_2. The multicusp ECR ion source concept has been redesigned to increase output beam current while reducing its physical size. The following design improvements have been implemented: the physical size of the cylindrical applicator has been reduced to an OD of 3.75 inches and a cavity ID of 3.5 inches while retaining a discharge diameter of 5 cm, the multicusp magnets have been removed from the microwave excitation region, improved water and gas cooling allow for higher power (>200W) operation, the double extraction grids have been redesigned for greater transparency and hence greater beam current densities and the discharge is now self-starting at low pressures. The measured experimental performance indicates that when excited with the TE 111 mode at 2.45 GH_z, this source operates efficiently and easily at low imput gas flows (1-5 sccm) and pressures in Ar, O_2 and N_2 gases. The detailed experimental operation of this new ion beam source is reviewed.

29835 Carbon pellet cloud striations. Parks, P.B. (General Atomics Co., San Diego, CA (USA)). pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Fine scale striations, with alternating rows of bright and dark zones, have been observed in the ablation clouds of carbon pellets injected into the TEXT tokamak. The striations extend along the magnetic field for about 1 cm with quite regular cross-field variations characterized by a wavelength of a few mm. Their potential as a diagnostic tool for measuring q-profiles in tokamaks provides motivation for investigating the origin of the striations. The authors propose that the striations are not due to a sequence of high and low ablation rates because of the finite thermal magnetic islands localized at rational surfaces, q = m/n, would be responsible for reducing the electron flux to the pellet region; the length of the closed field line which forms the local magnetic axis of the island is too long to prevent a depletion of plasma electrons in a flux tube intercepting the pellet for the duration $2_{rp}/_{vp}$. Instead, they propose that striations are the manifestation of the saturated state of growing fluctuations inside the cloud. The instability is generated by E x B rotation of the ablation cloud. The outward centrifugal force points down the ablation density gradient inducing the Rayleigh-Taylor instability. The instability is not present for wave numbers along the field lines, which may explain why the striations are long and uniform in that direction. The E field deveiops inside the ablation cloud as a result of cold electron return currents which are induced to cancel the incoming hot plasma electron current streaming along the field lines.

29836 Changes in diode operating characteristics as a function of applied magnetic field geometry. Pregenzer, A.L. (Sandia National Labs., Albuquerque, NM (USA)); Woodworth, J.R.; Lockner, T.R.; Rosenthal, S.E.; Bieg, K.W.; Desjarlais, M.P.; Coats, R.S. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Bountiful, UT (USA) (1989). DOE Contract AC04-76DP00789. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

In order to propagate a lithium ion beam to the axis on PBFA II, a specific magnetic field geometry is required. If the ions lose no energy in the gas cell, and if lithium ions originate at the anode in the singly charged state and are stripped to the triply charged state in the gas cell membrane; conservation of canonical angular momentum requires that $\Psi_a = -2\Psi_g$. Here Ψ is the magnetic field stream function defined as $\Psi = rA\Theta$, where r is the radial position and $A\Theta$ is the Θ component of the vector potential in cylindrical coordinates. The subscripts a and g refer to the values of the stream function at the anode and the gas cell, respectively. If energy loss in the gas cell is taken into account, the factor of 2 increases to about 2.8 for 5 MeV lithium ions. Here, the authors present the experimental results and attempts to form a coherent picture of these results using both simulation and alalystic theory. Factors which are believed to be important are the anode surface area, the magnitude and uniformity of the magnetic insulation between the cathode tip and the active anode surface, the amount of radial magnetic flux in the diode feeds, and the magnetic field topology in the diode region. These factors may alter the dynamics of charge accumulation in the diode and thereby affect the timing of ion current enhancement.

29837 A computational Analysis of energy and mass transport in plasma skull melting processes. Brent, A.D. (Minnesota Univ., Minneapolis, MN (USA). Dept. of Civil and Mineral Engineering); Reid, K.J. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

In recent years, molten-bath plasma furnace technology has found increasing application in the metallurgical industries for both extractive and fabrication operations. This technology is inherently energy intensive and an understanding of the governing heat and mass transfer mechanisms is essential for the development of efficient plasma furnaces and optimal operational strategies. To augment an extensive experimental plasma research a mathematical modeling program has been initiated to provide computational capabilities applicable to process development, equipment design and process control of plasma reactors. The speed of numerical calculations allows the implications of a large number of design optimization procedure. An improved understanding of transport phenomena within plasma furnaces may also influence or change presently accepted operational strategies. The successful operation of a molten-bath plasma furnace hinges on correctly balancing power input, process energy requirements and heat losses. Control of this thermal balance is particularly critical in skull melting operations where the maintenance of an adequate freeze-lining is essential for avoiding both product contamination and crucible damage. The results of a computational analysis of heat transfer and fluid flow in the melt region of a titanium skull melting furnace are presented and the controlling mechanisms discussed. The mathematical model developed addresses the conjugate heat transfer, phase change and boundary condition aspects of the problem and applies state-of-the-art computational methods to provide numerical solutions to the governing equations. The relative influences of thermal buoyancy, thermocapillary and arc shear induced flow on both the melt pool volume and skull profile are examined. Interactions between the flow effects are analyzed and discussed.

29838 The potential of D-T and D-^{3}He fuel cycles in field-reversed configurations. Kernbichler, W. (AEP, Graz University of Technology (AAT)); Miley, G.H. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The field-reversed configuration (FRC) is a possible direction for future fusion experiments and reactor development. Its potential for either D-T or D-^{3}He operation and the implication of the fuel choice on necessary reactor parameters (size, field, reversal factor,...) are the objective of the study reported in this paper. The high $\langle\beta\rangle$ and the divertor action of the open field lines are especially attractive for high power density operation and for direct energy conversion. The compact design, the cylindrical geometry, and the possibility of a translating the plassmoid from the formation chamber to the burn chamber are added positive features. Also theoretical studies indicates that charged fusion products can generate significant plasma current due to preferential loss directions. This, together with pellet injection may maintain sufficient current to sustain steady-state. Due to the early stage of development and the low effort compared to mainline devices, many problems are unsolved. A key one is particle and energy transport, unsolved. A key one is particle and energy transport, where several models offer different scaling laws. They range from the upper limit given by the loss sphere scattering model to more pessimistic laws based on anomalous lower hybrid transport. In the present study the authors use the loss sphere model by fitting it to the limited data base available and compare the results with other scaling laws. The emphasis here is the energetic and nuclear performance of both D-T and a D-^{3}He fueled plasmas in such a device. A profile averaged O-D plasma model is used which includes all relevant physical processes.

29839 Ohmic and alpha heating in the high-field IGNITEX Tokamak. Bickerton, R. (Texas Univ., Austin, TX (USA)); Fu, G.; Carrera, R.; Dong, J.; Montalvo, E.; Ordonez, C.; Tamor, S.; Van Dam, J.; Helton, J.; Hively, L. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The fusion ignition experiment IGNITEX will utilize a single-turn coil tokamak to produce and control ignited plasmas for scientific study. The special design characteristics of the IGNITEX device should permit a toroidal field on plasma-axis of 20 T and plasma currents of 12 MA during a 5 s flat top (about 10 energy confinement times). The pulse length is extended to a total of 10 s by precooling the magnet structure to liquid nitrogen temperature. The fusion ignition experiment IGNITEX should: 1) prove the scientific feasibility of controlled thermonuclear fusion, 2) permit the study of a new regime of physics: ignited plasma, 3) provide scientific knowledge for the design of future fusion systems, and 4) show how to produce and control fusion energy.

29840 First wall system in the IGNITEX experiment. Ordonez, C.A. (Texas Univ., Austin, TX (USA)); Carrera, R.; Chen, Y.; Howell, J.; Varghese, P. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Computer simulations to determine wall loading and surface response (e.g. recycling, sputtering and sublimitation) for the proposed ignition experiment, IGNITEX, are presented. The IGNITEX tokamak will ohmically heat a deuterium-tritium plasma to thermonu-clear, fusion ignition conditions. A single-turn coil will be used to produce a 20 Tesla toroidal field for plasma confinement. The first wall will be flat and limiterless with breaks for diagnostic and vacuum ports. The wall will consist of an amorphous carbon film applied to a thick beryllium coating which is plasma jet sprayed onto the vacuum vessel. The carbon film is applied between discharges (by the technique of carbonization) in order to: redeposit carbon eroded during the previous discharge, cover helium ash and other deposited impurities, and regulate the isotope ratio of desorbed, recycled hydrogen. Remote maintenance of areas strongly eroded by major disruptions will be carried out by beryllium plasma jet spraying with a robotic arm. During an ignited plasma discharge, the wall will be exposed to fluxes of neutrons, alpha particles, charge-exchange neutral atoms, photons, and plasma ions and electrons. The response of the wall surface to these fluxes will affect the operation of the machine. Two different time scales are considered in the analysis.

29841 Effects of the velocity-space particle loss on the behavior of field-reversed configurations. Hsiao, M.Y. (Pennsylvania State Univ., University Park, PA (USA). Dept. of Nuclear Engineering); Chiang, P.R. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

Field-reversed configurations (FRCs) have been observed to be stable for many Alfven times. However, the complete consistencies between experiments and theories have not been established. One important issue which has not been well studied or measured is the electric field. Recently, an electric potential profile in the edge layer has been suggested to explain the unusually broad edge layer. The electric field due to the velocity-space particle loss (VSPL) has also been calculated for FRCs. The VSPL-induced electric field may be an important factor in resolving some of the remaining issues in FRCs. The electric current profiles in the presence of the velocity-space particle loss are calculated. A shelf-consistent one-dimensional magnetic field is obtained by solving Ampere's law. The electric field structure developed from the VSPL mechanism is used to explain the origin of the rotation and the unusually broad edge layer. For the origin of the rotation, quantitative calculations of the stable period are given. A finite-loss-time model for the unconfined particles is suggested to justify the importance of the VSPL. Qualitatively, the dependences of the stable period on the experimental parameters such as temperature, magnetic field, density, and plasma length are consistent with the VSPL predictions. Quantitative results also show certain consistencies. For the edge layer, the density contribution from the energetic ions are calculated including the effects of the electric field. It is found that, due to the effect of the VSPL electric field, the density contribution from the energetic ions can be up to 1/3 to 1/2 of the density in the edge layer, depending on the operating parameters of FRCs.

29842 Non-equilibrium behavior of low-pressure plasma jets. Chang, C.H. (Minnesota Univ., Minneapolis, MN (USA). Dept. of Mechanical Engineering); Pfender, E. pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

After establishing the basic equations, some sample calculations are presented to examine the thermodynamic state of the plasma from atmospheric to low pressures (80 mbar). These results indicate the validity of local thermodynamic equilibrium (LTE) at atmospheric pressure as well as strong deviations from LTE at lower pressures especially in terms of chemical equilibrium. Departures from kinetic equilibrium are not as severe as those from chemical equilibrium along the centerline of the jet. However, there are some departures from transitional equilibrium in the fringes of the jet. It is demonstrated that conventional methods based on the LTE assumption are not appropriate for describing low-pressure plasma jets.

29843 NET II simulation of a pulse forming line (PFL) with spark gap and load. Hollmann, B.Z. (Naval Surface Weapons Center, Dahlgren, VA (USA)). pp. 758 of Proceedings of the sixth IEEE pulsed power conference (technical papers). Bernstein, B. H.; Turchi, P. J. IEEE Service Center, Piscataway, NJ (USA) (1987). (CONF-870656–: 6. Institute of Electrical and Electronic Engineers pulsed power conference, Arlington, VA (USA), 29 Jun - 1 jul 1987).

In this paper, the authors report on the NET II simulation. The purpose of this NET II simulation is to understand the operation of a spark gap switch in series with a resistive liquid load at the output of a pulse forming line (PFL), fed by a specified power supply. A series of runs simulated a shorted spark gap at the output of a PFL fed by a Marx generator. Comparing results with experimental data, it was inferred that the load resistance is less than the PFL's impedance, and with considerable inductance. The authors seek a load inductance as close to zero as possible.

29844 Impact of high magnetic fields on fusion systems. Cohn, D.R. (Massachusetts Inst. of Tech., Cambridge, MA (USA)). pp. 2950 of Proceedings of the 24th intersociety energy conversion engineering conference. Volume 6. IEEE Service Center, Piscataway, NJ (USA) (1989). (CONF-890815–: 24. intersociety energy conversion engineering conference, Arlington, VA (USA), 6-11 Aug 1989).

Paper 899532.

High field concepts can provide significant advantages for the size and performance of tokamak fusion reactors. These devices would make use of advanced superconductors and structural materials. Use of high plasma aspect ratios, super high field operation, and strong ohmic heating are promising new directions. The tokamak device has been demonstrated to be the most effective magnetic confinement machine for obtaining the burning plasma conditions required for a fusion reactor. Analysis of present experimental results together with basic theoretical considerations indicates that high magnetic fields can have a large beneficial impact on reactor performance and cost. At the same time superconducting magnet technology has been steadily advancing. Concepts that maximize the beneficial impacts of high fields and make use of advanced superconducting magnet technology could thus have a profound impact on the development of fusion systems. In this paper the authors discuss this approach and describe some promising directions.

29845 Neoclassical transport of isotropic fast ions. Hsu, C.T. (Massachusetts Institute of Technology, Cambridge, Massachusetts 02139 (US)); Catto, P.J.; Sigmar, D.J. *Physics of Fluids B (USA)*, 2(2): 280-290 (Feb 1990). DOE Contract AC02-78ET51013;FG02-88ER53263.

A study of radial gradient-driven neoclassical transport of fast ions, produced by an isotropic source in an axisymmetric toroidal system, is presented. The governing equation is a flux surface averaged Fokker–Planck equation that retains both the effects of the pitch angle scattering and drag. It is solved by utilizing an eigenfunction technique in conjunction with a rigorous numerical treatment. The results, which are valid for finite inverse-aspect-ratio ϵ, are found to fall between the previous limiting calculations [Nucl. Fusion **15**, 359 (1975); Phys. Rev. Lett. **60**, 1954 (1988)] for most of the relevant parameter regimes.

29846 Stationary flow model of ablatively imploded spherical shells. Montierth, L.M. (Los Alamos National Laboratory, X-1, E531, Los Alamos, New Mexico 87545 (US)); Morse, R.L. *Physics of Fluids B (USA)*, 2(2): 353-370 (Feb 1990).

The stationary flow model of spherical ablation is extended to shells, solutions with a density discontinuity at the critical surface, and charged-particle-beam-driven ablation. Parameter studies of the shell solutions show the relationship between shell aspect ratio, relative ablative mass removal or burnthrough, laser power, and shell material type. The discontinuous solutions are shown to occur when the critical surface and sonic surface coalesce. The relationship of these discontinuous solutions to particular physical situations is shown to be ambiguous in a way that must be resolved by microscopic transport calculations. Charged-particle-driven ablative implosion processes are shown to resemble laser-driven ablation. However, qualitatively different ablation processes occur in different regimes of the power and particle range of the incident beam. Procedures are described by which stationary solutions can be used to predict and interpret the results of experiments and numerical simulations.

29847 The theory of final focusing of intense light ion beams. Watrous, J. (Plasma Technology Branch, Naval Research Laboratory, Washington DC 20375 (US)); Ottinger, P.F.; Mosher, D. *Physics of Fluids B (USA)*, 2(2): 378-389 (Feb 1990).

Efficient transport of the high-power light ion beams of interest to inertial confinement fusion (ICF) experiments may require the use of large radius transport channels. The mismatch in the radii of the transported ion beam and the ICF target requires that the beam be focused following transport. A theoretical description of intense light ion beam focusing with a *z*-discharge plasma is presented. The theory is based on a Vlasov equation description of a fully charge- and current-neutralized ion beam, neglecting any angular momentum of the beam ions. An initial ion beam phase-space distribution with adjustable parameters is considered so that its effect upon the phase-space distribution at the focal plane can be analyzed. A numerical code is used to analyze the effect of angular momentum on the focusing properties of the final focusing cell. The theoretical analysis gives expressions for the focal length, for the discharge current required to produce a given degree of focusing, and for the radial number density profiles at the focal plane. The analysis of angular momentum indicates that the focal length and focusing current are not strongly affected even when beam ions have a significant amount of angular momentum.

99 GENERAL AND MISCELLANEOUS

29848 (CONF-9004177–1) **Understanding the computing system domain of advanced computing with microcomputers.** Hake, K.A. Oak Ridge National Lab., TN (USA). [1990]. 24p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Advanced computing for the social sciences conference; Williamsburg, VA (USA); 10-12 Apr 1990. Order Number DE90009825. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Accepting the challenge by the Executive Office of the President, Office of Science and Technology Policy for research to keep pace with technology, the author surveys the knowledge domain of advanced microcomputers. The paper provides a general background for social scientists in technology traditionally relegated to computer science and engineering. The concept of systems integration serves as a framework of understanding for the various elements of the knowledge domain of advanced microcomputing. The systems integration framework is viewed as a series of interrelated building blocks composed of the domain elements. These elements are: the processor platform, operating system, display technology, mass storage, application software, and human-computer interface. References come from recent articles in popular magazines and journals to help emphasize the easy access of this information, its appropriate technical level for the social scientist, and its transient currency. 78 refs., 3 figs.

29849 (CONF-9005106–) **13th Department of Energy Computer Security Group conference "Security through teamwork": Proceedings.** USDOE Office of Administration and Human Resource Management, Washington, DC (USA). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Assistant Secretary for Defense Programs, Washington, DC (USA). Office of Safeguards and Security. [1990]. 206p. Sponsored by U.S. DOE Defense Programs. From 13. Department of Energy computer security group conference: security through teamwork; Augusta, GA (USA); 8-10 May 1990. Order Number DE90010251. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

We live in a world of Personal Computers. Some are simply stand-alone, yet some connect to mainframes or even networks and modems, and the number of PCs used is on the rise. Along with the notable increase in microprocessors, Computer Security issues and concerns for computing resources have multiplied. Questions have arisen, such as: What PC hardware and software products do we have at our Site? Which PCs connect to modems? Where, specifically, are all of our word processors, and who are the CSSOs for these systems? With these challenges in mind, Mason and Hanger, Silas Mason Co., Inc., at Pantex Plant, developed an in house program for keeping track of all security plan and system inventory information for each workstation on site. The program is used for CSSOs to maintain information on the systems within their area of responsibility. Whenever the CSSI makes a change to a plan(s), the program creates an update diskette for the CSSM/CPPM to use in maintaining a master database of current security plan addendums. The program also generated five local forms: the Security Plan Addendum, a Contingency Plan and Risk Analysis, a Hardware and Software Inventory report, Modem Requests, and a Material Move Order. These forms supplement the local Master Security Plan for Microprocessors.

29850 (INIS-XN–199) **NEA Activities in 1988.** Nuclear Energy Agency, 75 - Paris (France). 1989. 51p. Order Number DE90625258. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

The following topics are developed: trends in nuclear power; nuclear development and the fuel cycle; nuclear safety and licensing; radiation protection; radioactive waste management; legal affairs; nuclear science; NEA joint projects; information programmes.

29851 (UJV–8682-V) **Progress report for '88.** Havelka, S. (ed.) (and others). Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia). Feb 1989. 64p. (In Czech). Order Number DE90625058. Available from NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

Results are reported of nuclear power research including reactor physics, reactor materials, reactor technology, fuel cycle chemistry; of research in ionizing radiation applications including radiation technologies, radiopharmaceuticals, neutron activation analysis, neutron radiography. Services are outlined provided by the UJV, such as the production of radiopharmaceuticals, development and manufacture of semiconductor radiation detectors, irradiation services, data processing services, library and information centre services. (E.J.). 38 figs., 7 tabs., 107 refs.

29852 (UTRCN-G–18) **Report on progress of researches by common utilization of JAERI nuclear facilities, for fiscal 1988.** Tokyo Univ. (Japan). Research Center for Nuclear Science and Technology. 1989. 367p. (In Japanese). Order Number DE90777886. Available from NTIS (US Sales Only), PC A16/MF A01.

In 1988, this system called 'Common utilization of JAERI facilities' so far was changed to 'Joint research utilizing JAERI facilities', and by evaluating more positively the function of the General Research Center for Nuclear Energy, it has been emphasized to promote and coordinate the joint research among universities centering around the utilization of JAERI facilities. The total number of the research subjects in fiscal year 1988 reached 138, but the results of 120 of them are collected in this book. General joint research is the standard form of the utilization of various facilities that JAERI has opened to common utilization. Cooperation research is to be carried out by concluding research cooperation contracts between university researchers and JAERI researchers, and the facilities which are not opened to common utilization can be used. In the general joint research, the utilization of irradiation such as activation analysis, radiochemistry, irradiation effect, neutron diffraction and so on and the research using beams are mostly carried out, but in the cooperation research, reactor engineering, reactor materials,, nuclear physics measurement and so on are the main subjects. The total number of visitors in one year was 3829 man-day. (K.I.).

9901 Management

29853 (EGG-M–90062) **MORT [Management Oversight and Risk Tree] based risk management.** Briscoe, G.J. EG and G Idaho, Inc., Idaho Falls, ID (USA). Feb 1990. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-8909290–2: Risk management symposium, Whippany, NJ (USA), 6-7 Sep 1989). Order Number DE90009620. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Risk Management is the optimization of safety programs. This requires a formal systems approach to hazards identification, risk quantification, and resource allocation/risk acceptance as opposed to case-by-case decisions. The Management Oversight and Risk Tree (MORT) has gained wide acceptance as a comprehensive formal systems approach covering all aspects of risk management. It (MORT) is a comprehensive analytical procedure that provides a disciplined method for determining the causes and contributing factors of major accidents. Alternatively, it serves as a tool to evaluate the quality of an existing safety system. While similar in many respects to fault tree analysis, MORT is more generalized and presents over 1500 specific elements of an ideal "universal" management program for optimizing occupational safety.

29854 (ORNL/Sub–7685/1-T23) **Evacuation of institutionalized and specialized populations.** Vogt, B.M. (Tennessee Univ., Knoxville, TN (USA)). Oak Ridge National Lab., TN (USA). Feb 1990. 104p. Sponsored by U.S. Federal Emergency Management Agency. DOE Contract AC05-84OR21400. Order Number DE90007967. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The purpose of this research was to assess the needs of organizations caring for institutional and specialized populations when faced with a threat or hazard requiring an evacuation. Individuals within specialized populations are unlike other victims of disaster because of their inherent dependency on organizational care givers and require different management strategies on the part of organizations and agencies in an evacuation. The research sought to identify those aspects of coping strategies that have been used

successfully to manage an emergency evacuation. To identify special populations that have evacuated from institutions and similar facilities over a four-year period, a computerized search was conducted of media accounts describing such events. The search yielded a total of 1024 accounts from which four major subgroups were identified: nursing homes and related care facilities, hospitals, educational institutions, and correctional facilities. A miscellaneous group including housing for the elderly, apartments and other building complexes, workplaces and factories, public facilities, and places occupied by transient populations, such as transportation units and recreational facilities, could be used for future study. Among the factors found to affect evacuations were the extent of organizational resources (such as the number of staff or other individuals available at the time of the event), the type and number of clientele, and such community characteristics as population density. The study focuses on selected organizational characteristics of health care facilities (nursing homes and related care facilities and hospitals) which have recently experienced either a partial or complete evacuation of their facilities. 165 refs., 13 tabs.

29855 (PNL-MA–70-Vol.1) **Procedures for Quality Assurance Program: Volume 1.** Shaub, R.L.; Ryder, D.E. Pacific Northwest Lab., Richland, WA (USA). Dec 1989. 384p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC06-76RL01830. Order Number DE90010001. Available from NTIS, PC A17/MF A01 - OSTI; GPO Dep.

These administrative procedures have been developed to implement the quality assurance program described in PNL-MA-70, Quality Assurance Manual. The manual and procedures establish requirements, responsibilities, and methods for execution of the program consistent with US Department of Energy (DOE) policies and requirements. When specified by a QA Plan, a Statement of Work or other governing document, PNL activities affecting quality shall be performed in accordance with the administrative procedures. The procedures are controlled documents assigned to the person named on the cover sheet. The assignee is responsible for maintaining the procedures in an up-to-date condition, consistent with Controlled Document Lists, by incorporating subsequent changes or new procedures promptly as they are issued. These procedures shall be available and used at the location where the prescribed activity is performed. A Controlled Document List (CDL) for each type of administrative procedure is included for use as a table of contents. The CDL lists procedure numbers, titles, revisions and/or amendments and the effective date. Work shall be performed in accordance with the latest effective procedure revision and/or amendment identified in the CDL unless a Controlled Document Transmittal Record (CDT/R), a QA Plan, or a Statement of Work allows or requires otherwise. This document is Volume 1 of a two volume set.

29856 (PNL-MA–70-Vol.2) **Procedures for Quality Assurance Program—QAPs: Volume 2.** Shaub, R.L.; Ryder, D.E. Pacific Northwest Lab., Richland, WA (USA). Dec 1989. 94p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC06-76RL01830. Order Number DE90010000. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

29857 (AD-A–216433/3/XAB) **Distributed decomposition of block-angular linear programs on a Hypercube computer.** Ho, J.K.; Gnanendran, S.K. Tennessee Univ., Knoxville, TN (USA). Management Science Program. Jul 1989. 27p. (MSP–89-3). Available from NTIS, PC A03/MF A01.

Algorithms based on the Dantzig-Wolfe decomposition principle for linear programs are implemented on an Intel iPSC-2 Hypercube computer with 64-processors. Computational results with block-angular linear programs from diverse applications are reported. They indicate that the approach of distributed computation on relatively inexpensive multiple processor computers may be very cost-effective for large, structured linear programs. It is also shown that by studying certain characteristics of the interaction among the master and subproblems, one can select algorithms that best exploit the parallel processing environment.

29858 (AD-A–216452/3/XAB) **DARPA/ISTO (Defense Advanced Research Projects Agency/Information Science and Technology Office) quarterly report. Report for 1 April-30 June 1989.** Reif, J.H. Duke Univ., Durham, NC (USA). 1 Jul 1989. 16p. Available from NTIS, PC A03/MF A01.

A system of rules and techniques is developed for derivation of various classes of parallel algorithms including: (1) Systolic algorithms for various fixed connection networks; (2) Randomized parallel algorithms; (3) Parallel algorithms for tree and graph problems; and (4) Parallel algorithms for algebraic problems. The development is emphasized of fundamental derivation techniques that can be utilized in as wide a class of parallel algorithms as possible. The specific algorithms to be derived have themselves been carefully chosen to be as fundamental as possible. Algorithms and areas currently under investigation include: parallel list ranking, parallel graph connectivity, automatic parallel compilation from segmented straight-line programs, and derivation of pipelined algorithms for small-diameter networks.

29859 (AD-A–216579/3/XAB) **Speculative computation in Multilisp. Master's thesis.** Osborne, R.B. Massachusetts Inst. of Tech., Cambridge, MA (USA). Lab. for Computer Science. Dec 1989. 266p. (MIT/LCS/TR–464). Available from NTIS, PC A12/MF A02.

This thesis demonstrates by experiments, that performing computations in parallel before their results are known to be required can yield performance improvements over conventional approaches to parallel computing. We call such eager computation of expressions speculative computation, as opposed to conventional mandatory computation that is used in almost all contemporary parallel programming languages and systems. The major requirements for speculative computation are a means to control computation to favor the most promising computations, and a

means to abort computation and reclaim computation resources. We investigate these requirements in the parallel symbolic language Multilisp and conclude that we need the following support for speculative computation: for controlling computation we need ordering (ranking of computations by their promise), demand transitivity, and modularity, and for reclaiming computation we need explicit, reversible reclamation with automatic naming of descendants. The main contribution of this work is a sponsor model which provides this support for speculative computation in Multilisp. A sponsor is an agent which controls the allocation of resources to computation. This sponsor model handles control and reclamation of computation in a single, elegant framework. We also discuss the optimal scheduling of speculative computation and present new results for optimal scheduling in simple cases.

29860 (AD-A-216581/9/XAB) **High-level connectionist models. Semiannual report.** Pollack, J.B. Ohio State Univ., Columbus, OH (USA). Dept. of Computer and Information Science. Aug 1989. 87p. Available from NTIS, PC A05/MF A01.

The major achievement of this semiannum was the significant revision and extension of the Recursive Auto-Associative Memory (RAAM) work for publication in the journal Artificial Intelligence. Included as an appendix to this report, the article includes several new elements: (1) Background - The work was more clearly set into the area of recursive distributed representations, machine learning, and the adequacy of the connectionist approach for high-level cognitive modeling; (2) New Experiment - RAAM was applied to finding compact representations for sequences of letters; (3) Analysis - The developed representations were analyzed as features which range from categorical to distinctive. Categorical features distinguish between conceptual categories while distinctive features vary within categories and discriminate or label the members. The representations were also analyzed geometrically; and (4) Applications - Feasibility studies were performed and described on inference by association, and on using RAAM-generated patterns along with cascaded networks for natural language parsing. Both of these remain long-term goals of the project.

29861 (AD-A-216663/5/XAB) **Center for the integration of optical computing. Final technical report, 1 October 1986-30 September 1989.** Sawchuk, A.A.; Steier, W.H. University of Southern California, Los Angeles, CA (USA). Dept. of Electrical Engineering. 30 Nov 1989. 67p. Available from NTIS, PC A04/MF A01.

This report summarizes the research progress in the 3-year period in the area of integrated optical computing. The topics include: dynamic optical interconnections, low threshold laser arrays, array receivers, neural computation vision algorithms, lenslet array processors, neural net photonic architectures, Fabry-Perot spatial light modulators, optical associative memories, opto-optical switching, MQW spatial light modulators, and volume holographic optical elements.

29862 (AD-A-216747/6/XAB) **High-performance computer-programming environments. Final report, 1 October 1987-30 September 1988.** Snyder, L.; Notkin, D. Washington Univ., Seattle, WA (USA). Dept. of Computer Science. 30 Sep 1988. 10p. Available from NTIS, PC A02/MF A01.

This one year grant had the primary goal of the assessment of the Poker Parallel Programming environment and the planning and design of new parallel programming environment. These goals were achieved. The new programming environment, to be built on a software platform that permits rapid prototyping of alternative environments, was designed using a three level language abstraction. The central publications include the assessment of Poker, two papers on prototype graphic debugging environment, and two papers on parallel computer structures.

29863 (AD-A-216812/8/XAB) **Numerical algorithms for parallel computers. Final technical report, 1 May 1986-31 August 1989.** Adams, L.M. Washington Univ., Seattle, WA (USA). Dept. of Applied Mathematics. 31 Aug 1989. 11p. Available from NTIS, PC A03/MF A01.

Throughout the duration of this grant, progress has been made on five fronts: analysis of parallel iterative methods using Fourier analysis techniques, preconditioners for linear systems on parallel architectures, numerical grid generation algorithms for fighter aircraft configurations, parallel domain decomposition algorithms for symmetric eigenvalue problems, and parallel language design issues from an applications point of view.

29864 (AD-A-217056/1/XAB) **Semi-iterative methods on distributed-memory multiprocessor architectures.** Hadjidimos, A.; Houstis, E.N.; Rice, J.R.; Samaratzis, M.K.; Vavalis, E.A. Purdue Univ., Lafayette, IN (USA). Dept. of Computer Science. 1989. 10p. Available from NTIS, PC A02/MF A01.

In the parallel ELLPACK (//ELLPACK) project we are developing a library of parallel iterative methods for distributed memory multiprocessor systems and software tools for partitioning and allocation of the underlying computations. In this paper we discuss the implementation issues within the //ELLPACK environment and present preliminary performance results of some of the modules on three hypercube based architectures: NCUBE, iPSC/1 and iPSC/2. These results indicate that the iterative methods are capable of delivering close to optimal scaled speedups while the combination of concurrent/vector processing can lead to sizable improvements of the overall performance. These experiments have shown that distributed memory systems are capable of solving significantly large problems effectively.

29865 (ANL-89/43, pp. 27-50) **A position on multiprocessing in prolog.** Keller, R.M. (Univ. of California, Davis (USA)). Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372-: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Multiprocessors appear most useful for applications such as robotics, vision, signal processing, hypothetical reasoning, optimization, and simulation. Currently several impediments still exist to effective use of multiprocessors. Most software tools are neither portable nor widely available and languages do not exploit multiprocessing capabilities. Logic programming currently is not the choice for most applications. One reason is that in many SIMD applications, logic programming provides no leverage. Logic programming is also just as cumbersome as C for large programs. An additional concern is, which approach to use: explicit communication (like Strand), restricted and parallelism, bilingualism, etc. Deductive databases offer the advantages of efficient compilation and optimization. They are now used for rapid prototyping. A gap still exists between large-scale database systems and database research. U.S. researchers are also not generally receptive to the idea of deductive databases. What does the future hold? More work is needed in debugging, performance evaluation, programming environments tuned for constraint programming, sub-Turing languages, and user-defined constraint domains.

29866 (ANL-89/43, pp. 51-56) **Developing the parallel inference machine.** Goto, Atsuhiro (Institute for New Generation Computer Technology, Tokyo (Japan)). Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372-: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

In the Japanese Fifth Generation Computer Systems project, parallel inference machine (PIM) systems are developed based on logic programming. The aim is to realize very high execution performance (say, 100 times the performance of current machines). The design involves implementation of a logic programming language, KL1, and a new operating system. Several pilot PIM machines are being developed; one will include up to 512 processor elements communicating through shared memory. The processor architecture has incorporated various innovative features to suit concurrent logic programming languages. For example, the processor design is based on a tagged architecture. Macro-call instructions permit subroutine calls for polymorphic operations required by high-level languages such as logic programming. Dedicated instructions are introduced to support incremental garbage collection. 17 refs.

29867 (ANL-89/43, pp. 57-60) **Future trends in database/logic programming.** Warren, D.S. Argonne National Lab., IL

(USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Data-oriented problems are solved by a combination of code written in a programming language and code executed by a database system. The goal of recent research has been to put more capability into the database system. There are two obvious approaches to making a future database system with capability which now requires both an application programming language and a database. In the first approach, an object-oriented programming language is taken as the base, and capabilities are added. The object-oriented database inherits the procedures of the programming language; the notions of declarative specifications are essentially abandoned. In the second approach, a deductive database is enhanced by the addition of recursion; this has led to the development of datalog, a sublanguage of Prolog. Because the Prolog evaluation strategy is incomplete, datalog+ systems have explored bottom- up evaluation strategies (e.g., Magic Sets/ Templates). Unfortunately, there remains a serious optimization problem: users are reluctant to give up control to a system that cannot find the optimal way to evaluate every query. Needed is a compromise on control. For example, the programmer might give declarations (pragmas and annotations) that change the evaluation strategy but leave the semantics untouched. Such a compromise will require integration of various evaluation strategies; support of complex objects, tabulation, and caching; interactive program transformation; and incorporation of constraint logic programming.

29868 (ANL–89/43, pp. 61-64) **Report on parallel logic programming on the Multi-PSI.** Rokusawa, Kazuaki (Institute for New Generation Computer Technology, Tokyo (Japan)). Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

The Multi-PSI is a pilot parallel inference machine developed at ICOT in the second stage of the FGCS project. The purpose was to test new implementation techniques of concurrent logic languages, and to conduct research on parallel programming on a medium-scale parallel computer. Research activities cover parallel algorithms, parallel programming environments, language supports, and mapping (scheduling and data/load distribution). Research confirms the gap between concurrent logic programs and the parallel machines. A program in a concurrent logic language defines data dependency and possible parallelism, but does not address how the logical concurrency is embodied as physical parallelism. Mapping is especially important for loosely coupled architectures, in which data access cannot be assumed to be of uniform cost. The following approach was taken: (1) Pick a problem, design a concurrent algorithm, and write it in KL1. (2) Select a mapping strategy, run the program on the Multi-PSI. (3) Measure performance, analyze the results, and try new algorithms or new mapping strategies. The report covers four different types of problems: Packing piece puzzle (pentomino). A rectangular box and a collection of pieces with various shapes are given. We used a multilevel dynamic load balancing scheme. Speedups of 28.4 with 32 processors and 50 with 64 processors were obtained with the shortest path problem. Given a graph where each edge has an associated nonnegative cost and a start node in the graph, the problem is to find the minimum cost path to every node. Using a completely distributed algorithm with a priority mechanism, we studied strategies of mapping a large-scale grid graph (with 10^4 vertices) on large-scale MIMD machines with 100 processors. A Natural language parser problem is to construct all possible parse trees for an English sentence. The program called PAX does a bottom-up chart parsing. 5 refs.

29869 (ANL–89/43, pp. 65-74) **GenBank in nested relations.** Yokota, Kazumasa (Institute for New Generation Computer Technology, Tokyo (Japan)); Tanaka, Hidetoshi. Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

The purposes of database and knowledge base management systems at ICOT are to: (1) provide various knowledge information processing systems with database and knowledge base management facilities, and (2) make various experiments on next-generation intelligent database systems. To address these purposes, ICOT researchers are exploring two different types of projects. The Kappa system is an advanced database management system based on a nested relational model. The model includes the following features: List and bag constructors are used to control the sequence and cardinality of elements efficiently. Long image or text data can be stored. A program interface is user-definable. A constraint logic programming language CAL is used as generation or integrity rules for algebraic constraints between attributes. Semantic networks can be stored as is and manipulated by the corresponding database language. Main memory database management system is supported. A prototype Kappa system (60,000 lines) implemented in 1987 was released to some beta test sites. The second version (125,000 lines) was implemented in March 1989. A parallel version is currently under design and development. To date, one promising application has been the implementation of the GenBank database in Kappa. Four kinds of sequence databases have been loaded; invertebrate, virus, bacteria, and phage. We plan set up algorithms for homology searches, representation languages for secondary and tertiary structures, and extraction of motifs. 7 refs.

29870 (ANL–89/43, pp. 75-76) **Applied mathematics for digital systems.** Good, D.I. (Computational Logic, Inc., Austin, TX (USA)). Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

The absence of accurate mathematical models of the dynamic behavior of hardware and software systems increases risks of high developmental costs and operational malfunction. Computational Logic, Inc., is developing applied mathematics for digital systems. Precise mathematical models were produced for the dynamic behavior of some basic hardware and software systems, also proofs of the equivalence of these models. At the hardware level, two models were stated for the 32-bit FM8502 microprocessor (comparable to a PDP-11). The lowest-level hardware model is an interpreter for the gate-level state of the machine. The highest level is an interpreter for the machine language. Both interpreters are stated as total recursive functions in the Boyer-Moore logic. The two models were formally proved to be equivalent, and the proof was checked completely with the mechanical Boyer-Moore theorem prover. At the software level, a mathematical model of the behavior of programs in the Piton assembly language was similarly stated. An interpreter for Piton programs was stated as a total recursive function in the Boyer-Moore logic, and a compiler was implemented that compiles Piton into machine code. This compiler proved that the result of interpreting the compiled program on the FM85O2 interpreter is equivalent to interpreting the Piton program on the Piton interpreter. An interpreter also was stated for programs of the Micro Gypsy subset of the high-level Gypsy language, and a compiler for converting into Piton programs was set up. This compiler proved that the result of interpreting the compiled program on the Piton interpreter is equivalent to interpreting the Micro Gypsy program with its interpreter. A separate experiment was the implementation and proof of the KIT separation kernel for a machine similar to the FM85O2. 6 refs.

29871 (ANL–89/43, pp. 77-90) **Analysis of scalability of parallel algorithms.** Rao, V.N. (Univ. of Texas, Austin (USA)); Kumar, V. Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Parallel processing opened a new dimension in the design an analysis of algorithms. But there is a wide gap between the theory

of parallel algorithms and the understanding of the performance of parallel algorithms on currently available multiprocessors. A new measure—the inefficiency function—is presented that captures the scalability of parallel algorithms. This measure is used in the study of three problems: solution of a wave equation, fluid flows simulation using flux corrected transport. And a parallel depth-first search for state-space trees. Inefficiency analysis has proved especially beneficial in: (1) identifying the scalability of parallel algorithms, (2) determining how fast a problem can be solved efficiently, (3) selecting an efficient parallel algorithm from among those reported in the literature, (4) deriving better work-distribution algorithms for shared-memory, ring, and hypercube architectures, (5) determining the best parallel architectures to solve a problem, and (6) studying parallel algorithms for problems believed to be beyond the class NC. 19 refs.

29872 (ANL–89/43, pp. 91-98) **Parallel logic programming algorithms for the bestpath problem.** Tick, E. Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Six parallel logic programming algorithms are presented for solving the bestpath problem. This problem is a simple search problem concerning a graph. The graph is constructed of nodes and nondirected edges. Each edge connects two nodes, and a node is connected to at least one edge. A path is a route from one node to another, through an arbitrary number of edges. The cost of the path is the sum of the costs of the edges on the path. The problem is to find all minimum cost paths for a given starting node to each node in the graph. The six algorithms were as follows: (1) Dijkstra's sequential Prolog algorithm, (2) naive threshold pruning, (3) Overbeek's parallel boundary extension, (4) Tick's modification of the sequential algorithm using comparators, (5) Taki's monitor evaluation algorithm based on a data structure approach, and (6) Ichoyoshi's nearest-neighbor method based on a process structure approach. The algorithms were implemented in OK-parallel Prolog and Flat Guarded Horn Clauses (FGHC) and executed on a Sequent Symmetry with 1-15 processing elements. The results are interesting: even on 15 PEs, none of the programs beat the sequential Prolog program running on 1 PE. The closest are within 50% for the 1237-node graph. The two primary overheads reducing performance are the overhead of spawning small granularity tasks in OR-parallel Prolog, and the merge overhead of stream management in FGHC. These results point to areas of improvement for the system architectures. 4 refs.

29873 (ANL–89/43, pp. 99-112) **Strand: A practical parallel programming tool.** Foster, I. (Argonne National Lab., IL (USA)); Taylor, S. Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Will logic programming ever reach the point where it is used to program real parallel applications on parallel machines? Contrary to common belief concurrent logic programming languages are already being used very effectively for this purpose. Two applications developed at Argonne— GenBank similarity searching and weather modeling—have used bilingual programming techniques to get substantial speedups over existing sequential codes. In these programs a concurrent logic language (Strand) is used to organize concurrent computations consisting of many sequential components. The sequential components are written in C or Fortran. Bilingual programming raises several issues that warrant further investigation—for example, efficiency in fine-grained implementations, and techniques for specifying and verifying interfaces between concurrent and sequential components. New tools also will be required to aid program development, especially for gathering and visualizing information about large-scale computations. 22 refs.

29874 (ANL–89/43, pp. 113-122) **DNA sequence knowledge base system (KNOA).** Konagaya, Akihiko (C and C Systems Research Labs., Kawasaki (Japan)); Yokota, Minoru. Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Genetic information processing is being explored as part of the FGCS project. Logic programming has two principal advantages for genetic information processing: rapid prototyping and logical inference capabilities. Little is known about genetic information processing models, and new algorithms are constantly under review for analyzing more exact genetic models. Rapid prototyping is invaluable: demonstration of the feasibility of the algorithm is more important than performance. Logic programming greatly enhances prototyping because it provides high-level programming facilities for matching, inference, and database access. These facilities enable the researcher to concentrate his efforts on exploiting new algorithms concerning genetic information processing and to keep away from data management and complex execution control. The other important advantage of logic programming is that researchers can use logical inference. This feature is useful, for example, in homology searches, which involve identifying sequences that are similar to a target sequence in a data bank. The stochastic inductive inference can deal with the probable validity of an assertion even if it does not completely satisfy all the sequences in a superfamily, and even if it satisfies sequences that do not belong to the superfamily. A prototype DNA knowledge base system (KNOA) has been developed based on an inference machine with a fast Prolog processor and a large-scale main memory (320 Mbytes). The KNOA objective is an integrated system for genetic information processing in logic programming. Currently, GenBank, NBRF, and Protein Structure Data Bank have been implemented as collections of Prolog clauses. Several homology search algorithms are also available, and a prototypical secondary structure inference verification system developed. The system is useful in improving intuitive understanding of tertiary protein structures. 14 refs.

29875 (ANL–89/43, pp. 123-128) **Using logic programming to address computational problems in genetic sequence analysis.** Overbeek, R. (Argonne National Lab., IL (USA)). Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Logic programming is a technology with much promise. Its strengths are integration of database issues with normal programming, expression of parallel algorithms, rapid prototyping capabilities, and high-level expression of constraints and solutions. Molecular biology is launching an endeavor that will require precisely these capabilities. To prove the feasibility, two prototypical problems were explored; interpretation of sequencing gels, and similarity searches. Gel interpretation involves five basic stages: obtaining a digitized image; normalizing the data; aligning the distinct lanes (using a standard gel); creating a set of vectors that represent intensity values for the four lanes; and interpreting the four vectors, producing a list of characters from (a, c, g, t). The task is easy by computer, requiring only a 2-3 page program and significantly reducing the time needed to interpret these gels. Similarity searches involve comparing a new protein sequence to other known sequences. A group at Argonne has devised a program which can align up to 500 sequences of length 2000. The code is based on bilingual programming in Strand and C, and runs efficiently on SIMD parallel processors. It is the first program to handle more than a few sequences (say, up to 10). The Argonne group has also studied exactly how covariance arguments are constructed. Too often, computer scientists have produced simplified algorithms that ignore the way biologists form their estimates. By imitating the human biologist, the Argonne group has produced tools that have obtained new results in biology: a secondary structure of 75, and bonds in the 165. Finally, the BioServe Project deserves note. This automatically aligns a set of sequences or inserts a new sequence into an existing alignment. The facility is available via electronic mail and is currently being used by researchers at the Center for Prokaryotic Genome Analysis.

29876 (ANL–89/43, pp. 129-140) **A connotative treatment of circumscription.** Akima, J. (ICOT Research Center, Tokyo (Japan)). Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Circumscription proposed by McCarthy is a most promising formalizations of nonmonotonic aspects of common sense reasoning. Several versions proposed; still, are all for denotative minimization of predicates. That is, circumscription minimizes the extension of predicates. Researchers at ICOT have devised a connotative treatment of circumscription that overcomes three defective points of circumscription: absence of abnormal things, a limitation on equality, and inconsistency. Connotative circumscription is based on the idea of minimizing the set of names denoting objects that satisfy a certain predicate. The approach provides a form of the unique name assumption for a first-order sentence with functions and equality. Therefore, it is expected to contribute to declarative semantics for deductive database and logic programming with such sentences. 16 refs.

29877 (ANL–89/43, pp. 141-146) **EUODHILOS: interactive reasoning system for a variety of logics.** Minami, Toshiro (International Institute for Advanced Study of Social Information Science, Numazu (Japan)); Sawamura, Hajime. Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

EUODHILOS is a general-purpose reasoning assistant system with two characteristic features. One is its naturalness users can see and manipulate proof fragments interactively in a natural style as is used with paper and pencil. The other is its generality: EUODHILOS is logic-independent in the sense that the language and logic to be used are defined by its user. A logic in EUODHILOS has language and derivation systems. The user defines the language system, specifying characters to use and what strings of symbols are valid logical expressions. EUODHILOS will automatically generate a parser and unparser for the defined language, checks the validity of given external expressions, and translates them to the corresponding internal expressions. A derivation system in EUODHILOS has axioms and derivation rules. EUODHILOS will permit rewriting rules also inference rules as derivation rules. Well-known typical logics such as Hilbert's, Gentzen's, and equational can be treated within this framework. The system also supports the typical styles for reasoning: forward, backward, and a mixture. EUODHILOS intended as a reasoning assistant, involves interaction between the user and the system. Also, it can be used as a tool for computer-assisted instruction in logics and logical reasoning. 19 refs.

29878 (ANL–89/43, pp. 147-152) **Constraint solvers based on Groebner bases technique in CAL.** Sato, Yosuke (ICOT Research Center, Tokyo (Japan)). Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Three constraint solvers are reviewed; complex domain, Boolean domain, and the domain of finite-cofinite sets. Each is based on Groebner bases techniques that satisfy two properties: (1) for any constraint, the solver tells us if it is satisfiable or not; and (2) if a constraint is satisfiable its solutions as a canonical form. Work is continuing on development of an efficient implementation or mathematical theory concerning the validity of the work in finite-cofinite sets. Future work will involve extending CAL to deal with Groebner bases as objects. 6 refs.

29879 (ANL–89/43, pp. 153-166) **Parametric queries, linear constraints, and variable elimination.** Lassez, J.L. (IBM T.J. Watson Research Center, Yorktown Heights, NY (USA)). Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Various forms of declarative linear arithmetic are introduced in several languages from CLP(R) to Mathematical. To find canonical representations of constraints, to handle delays of nonlinear constraints, and to resolve guards in committed choice language and other related problems, anew and more powerful type of query must be answered: parametric linear queries. Proposed here is a simple mathematical formalism to address that problem. Fourier's variable elimination procedure and associated elementary theorems allow one to derive directly from their specification several interesting sets. For instance, one obtains the subsumption cone, which characterizes the set of all linear constraints implied by a set of linear constraints, the convex hull of a collection of polyhedral sets, the separability set that characterizes the hyperplanes separating two given polyhedral sets, and the set of answers to a given parametric query. If Fourier's variable elimination is a very powerful conceptual tool telling us what problems one can solve trivially in principle via variable elimination, it is generally impractical, as it generates for each variable eliminated an exponentially growing set of mostly redundant constraints. A new method is proposed for variable elimination that resets on a generalization of the notion of objective function in linear programming. It is more efficient than Fourier's procedure, as it bypasses all the costly intermediate steps and generates far less redundancy. This new method is to solve more efficiently the problem of implicit equalities—a key component in the computation of canonical representations of linear constraints. 15 refs.

29880 (ANL–89/43, pp. 167-172) **Candor - constraint and/or parallel logic language.** Hawley, D. Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

A group at ICOT is investigating constraint logic programming as a high-level paradigm for problem solving and knowledge representation. A new model, called Candor, is proposed based on the Andorra model and/or parallelism. Pure Andorra has semantics similar to Prolog, making it possible to benefit from analysis and transformation techniques applicable to Prolog, such as partial evaluation and abstract interpretation. Andorra, however, has the strategy prefer deterministic goals. The rule of choosing deterministic goals first is a good general heuristic because it often detect failure early, and it avoids redundant computation by delaying splitting the computation. A goal is deterministic if it has a maximum of one candidate clause that is satisfiable, based on the constraints in the head and body of the clauses. In Candor, there are three principal operations that are applicable to the respective three modes: and-reduction, or-extension, and block-splitting. The and-reduction and or-extension operations are similar to their counterparts in Andorra, except in that the mode transitions are different because of the introduction of blocks. The block-splitting operation is new; it provides a kind of lazy parallelism in which concurrent work can be done sequentially or in parallel, and that decision is made at the point of actually starting the work. Currently, the ICOT group has developed a very slow interpreter in KL1 for a subset of the language, and a couple of experimental KL1 implementations of the Buchberger algorithm have been made. Further work is needed on ways of expressing control and on design of the inter-solver interface. 13 refs.

29881 (ANL–89/43, pp. 173-192) **Design and implementation of LDL - a logic based language for data intensive applications.** Tsur, S. Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Logical Data Language (LDL) is an attempt to combine the advantages of logic programming and relational data base

technology. Effort on the LDL started late in 1984, and is now approaching maturity with two efficient prototypes. Summary aspects of LDL programming include: (1) a more declarative style of programming, (2) a less artificial formulation of some rules and recursive predicates. (3) No meta-level predicates. (4) Programming techniques based on difference lists or the sharing of partially instantiated lists will not work. (5) Efficient storage or modification of data for later access is very useful. LDL is suitable for data intensive applications and interfaces to relational databases.

29882 (ANL–89/43, pp. 193-218) **Applications of LDL to scientific computing.** Tsur, S. (Microelectronics and Computer Technology Corp., Austin, TX (USA)). Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Logical Data Language (LDL) is an attempt to combine the advantages of logic programming and relational data base technology. The LDL system has a language, a compiler/optimizer, a run time system that enables access to an in-memory object manager. The presentation covers; a general background and motivation for LDL, an application of LDL to complex data analysis problem, with an application to a synthesis problem. 6 figs.

29883 (ANL–89/43, pp. 219-222) **Elements necessary for the success of logic programming.** Bowen, K. Argonne National Lab., IL (USA). Dec 1989. (CONF-8910372–: Joint Japanese-American workshop on future trends in logic programming, Argonne, IL (USA), 11-13 Oct 1989). In *Joint Japanese-American workshop on future trends in logic programming.* Order Number DE90008343. Available from NTIS, PC A12.

Success of logic programming will be widespread use within a reasonable length of time (average life expectancy today). The necessary ingredients will be: (1) Solidity and reliability of both stand alone compiler and interactive development environments. And (2) Ability to serve everyday computing needs with relative ease and elegance including ability to; (a) run on a range of machines, (b) communicate in heterogeneous settings, (c) construct high-quality man-machine interfaces, (d) interface to a wide range of database management systems, and other packages. The paper examines other general points in some detail.

29884 (CONF-900652–1) **Symbolic pattern processing system for planar spatial structures.** Rao, N.S.V. Oak Ridge National Lab., TN (USA). 1990. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 10. international conference on pattern recognition; Atlantic City, NJ (USA); 17-21 Jun 1990. Order Number DE90001598. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We describe a symbolic pattern processing system that recognizes when composite planar structures are present in a two-dimensional spatial pattern. The composite objects are composed and identified by the arrangement of elementary objects (such as rectangles, squares, circles, etc.). The composite planar structures are represented by a special class of graphs where the nodes satisfy a two-dimensional ordering. We use straightforward algorithms to generate these graphs from an image (obtained using a vision system) that was preprocessed by a system of low-level neural networks. The graphs are generated for all arrangements of elementary objects in an image, and the resulting graphs are compared with predetermined models of composite objects in order to determine if the composite object is present in the image. We present an algorithm to find out if two given graphs match within a specified tolerance given by the pair (l,d). We then develop a similarity measure between two graphs based on two different linearizations of two-dimensional lattice points. A decision making module, based on empirical rules, decides if the image contains any instances of the prestored models of composite objects. 10 refs., 4 figs.

29885 (CONF-9006167–1) **Hypersingular integrals and the two dimensional Helmholtz equation.** Gray, L.J. Oak Ridge National Lab., TN (USA). [1990]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Japan/USA symposium; Palo Alto, CA (USA); 5-7 Jun 1990. Order Number DE90009821. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Hypersingular integral equations have proven to be very effective tool in the boundary element analysis of regions containing cracks. In previous studies, the reduction of the singular terms to a computationally reasonable form has relied on the the ability to analytically integrate the Green's function over a flat element. The purpose of this paper is to investigate the integration of a more complicated fundamental solution, that of the two dimensional Helmholtz equation, over a curved element. The Hankel functions are treated by integrating the singular part analytically, and other Green's functions. However, the higher dimensional analogue of the procedure employed herein to treat the quadratic isoparametric element is not practical, and other techniques will be required. 19 refs., 2 figs.

29886 (CTA-IEAv-NT–006/89) **Improvements in the BCG code.** Leite, S.B. (Jaakko Polyry Engenharia, Sao Paulo, SP (Brazil)); Caldeira, A.D.; Garcia, R.D.M. Centro Tecnico Aeroespacial, Sao Jose dos Campos, SP (Brazil). Inst. de Estudos Avancados. Sep 1989. 14p. Order Number DE90625245. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Some improvements introduced in the BCG code with the objective of making the code faster in execution are reported. The impact of these improvements in terms of CPU time saving is discussed for a sample problem. (author).

29887 (CTA-IEAv-NT–013/89) **BIBGTR: nuclear data libraries for the programs Unimug and Anisn.** Ono, S.; Caldeira, A.D. Centro Tecnico Aeroespacial, Sao Jose dos Campos, SP (Brazil). Inst. de Estudos Avancados. Nov 1989. 9p. (In Portuguese). Order Number DE90625246. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Nuclear data libraries generable by the NJOY for the programs UNIMUG and ANISN, using evaluated data from ENDF/B-IV and ENDF/B-V are described. These libraries will be used by Radioisotope Thermoelectric Generators Project of Instituto de Estudos Avancados. (author).

29888 (CTA-IEAv-NT–015/89) **Preliminary tests of WIMSD/4 program installed in a CDC CYBER 170/750 at IEAV.** Claro, L.H.; Anaf, J. Centro Tecnico Aeroespacial, Sao Jose dos Campos, SP (Brazil). Inst. de Estudos Avancados. Dec 1989. 17p. (In Portuguese). Order Number DE90625247. Available from NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Some cell calculations options of the WIMSD/4 code were tested. Comparisons with the HAMMER code results are presented. Control cards for WIMSD/4 execution in the IEAv CDC CYBER 170/750 and input examples are included. (author).

29889 (CTA-IEAv-RI–015/89) **Adaptation of the SAR program to 89-1 version of the programs LINEAR, RECENT and SIGMA 1.** Caldeira, A.D.; Garcia, R.D.M. Centro Tecnico Aeroespacial, Sao Jose dos Campos, SP (Brazil). Inst. de Estudos Avancados. Oct 1989. 7p. (In Portuguese). Order Number DE90625248. Available from NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

The new subroutine Readpr of program Sar, compatible with the 89-1 version of programs Linear, Recent and Sigma 1 is presented.

29890 (DOE/ER/25054–2) **A broad research program on the sciences of complexity: Annual report.** Santa Fe Inst., NM (USA). 26 Jan 1990. 176p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER25054. Order Number DE90009625. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

The second full-fledged academic year at the Santa Fe Institute saw it extend its research activities centered on its organizing principle: complex systems. While there is not generally accepted definition of a complex system, common properties appear in the behavior of such systems. Complex systems typically have many components which interact nonlinearly. They frequently exhibit collective and emergent properties such as adaptation, pattern formation, and learning. There is often a hierarchy of length or time

scales, and sensitivity to initial conditions. Dissipative time evolution is characteristic; the system may be open to an environment that presents it with perpetual challenge; it may operate far from equilibrium and have a stochastic aspect. Typically there are many differing modes of behavior (solutions) of varying likelihood, as exemplified in evolutionary biology, turbulent flows, or glasses. Many complex systems have information storage capacity or memory and some are capable of extrapolating stored information to anticipate the future. At the beginning of 1989 many of the SFI research initiatives described in this report were already well established. Preliminary workshops had been held, in some cases subsequent full workshops were planned or had been held, collaborations were well established, and a residential research program was underway.

29891 (EGG-CATT–8898) **FORTRAN coding guidelines.** Cook, D.M.; Marshall, N.H.; Marwil, E.S.; Matthews, S.D.; Mortensen, G.A. EG and G Idaho, Inc., Idaho Falls, ID (USA). Computer Applications and Technology Transfer Group. Feb 1990. 13p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE90009804. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report describes the FORTRAN coding guidelines used by the Scientific Computing Unit at EG&G Idaho, Inc. All new software development of FORTRAN codes employs these guidelines. Existing software which undergoes adaptive or perfective maintenance is upgraded to meet these guidelines whenever possible. These guidelines are based on adherence to the FORTRAN language standard and utilization of good programming practices to achieve consistency within each software project. 7 refs.

29892 (EGG-CATT–8926) **VCS: A networked version control system.** Barber, D.G. EG and G Idaho, Inc., Idaho Falls, ID (USA). Computer Applications and Technology Transfer Group. Feb 1990. 26p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE90009805. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Version Control System (VCS) is a portable source control system which is based on the generic Source Code Control System (sccs) provided with many Unix systems. It extends the sccs capabilities and provides support for networked application development. The networking support is provided through TCP/IP facilities. VCS includes functions for version control, change control, base-lining and status reporting. Audit trail, project management, and application development tools are also provided.

29893 (JAERI-M–89-190) **Current status of uncertainty analysis methods for computer models.** Ishigami, Tsutomu (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1989. 70p. Order Number DE90777717. Available from NTIS (US Sales Only), PC A04/MF A01.

This report surveys several existing uncertainty analysis methods for estimating computer output uncertainty caused by input uncertainties, illustrating application examples of those methods to three computer models, MARCH/CORRAL II, TERFOC and SPARC. Merits and limitations of the methods are assessed in the application, and recommendation for selecting uncertainty analysis methods is provided. (author).

29894 (KEK–89-3) **Proceedings of the symposium on networking.** Karita, Yukio; Abe, Fumio (eds.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Jun 1989. 306p. (CONF-8902176–: 1. symposium on networking, Tsukuba (Japan), 6-7 Feb 1989). Order Number DE90777889. Available from NTIS (US Sales Only), PC A14/MF A01.

The first symposium on networking was held on February 6-7, 1989. Due to the increase of the needs of computer networks, several networks which connect among universities and laboratories are going to be constructed in Japan. However, the techniques in networking are not familiar to most people, and the information about these techniques is sometimes difficult to get, especially in multivendor connection. In such situation, an opportunity to hold a symposium on networking at the National Laboratory for High Energy Physics (KEK) was given. More than 200 people took part in this symposium, and the local area networks in institutions, the networks among institutions, the networks for high energy physics, the application of networks, the networks for academic research and so on are reported. The valuable discussion about networks was carried out, including the plans for near future. At the time of this symposium, the construction of the Gakujo-net and the Pacific network project of University of Hawaii were in progress, and many Japanese universities are going to construct their campus LANs, so the symposium seemed to be very timely. (K.I.).

29895 (OPTIMITURVE–7) **Knowledge based production planning for milled peat production.** Huusko, A. (Oulu Univ. (Finland). Research Inst. of Northern Finland). Valtion Teknillinen Tutkimuskeskus, Jyvaeskylae (Finland). Polttoaine- ja Polttotekniikan Lab. 1989. 24p. (In Finnish). Order Number DE90770715. Available from NTIS (US Sales Only), PC A03/MF A01.

In this report the observations of accomplishment and construction of knowledge-based peat production control system applicable for Haku peat production methods have been described. A hierarchical solution of the problem has been described. The estimation of factors like production risks and planning targets may be fulfilled by using method resembling expert system based on heuristics. On the lower hierarchical levels, e.g. in dividing of resources and in scheduling, the superiority of the logical programming is negligible.

29896 (PB–90-153354/XAB) **Parallel nonlinear optimization.** Lootsma, F.A. Technische Hogeschool Delft (Netherlands). Dept. of Mathematics and Informatics Computer Science. c 1989. 40p. (REPT–89-45). Available from NTIS, PC A03/MF A01.

The survey is concerned with three classes of nonlinear optimization methods which are highly suitable for implementation on parallel computers. In the area of unconstrained optimization, it concentrates on the Newton and quasi-Newton methods, because they can readily be converted into synchronous or asynchronous algorithms. Promising classes of methods in the area of constrained minimization are the so-called dual algorithms for separable and partially separable problems, and the decomposition techniques for block-angular problems with a small number of linking variables or linking constraints. Numerical experience with parallel implementations is limited in each of these classes of methods, but their potential has been widely explored on sequential computers. Accordingly, the paper sketches the possible benefits of parallel computering in the field of nonlinear optimization.

29897 (PB–90-154337/XAB) **Generally configurable multigrid implementation for transputer networks.** El-Giar, O.; Hopkins, T. Kent Univ., Canterbury (UK). Computing Lab. c Jun 1989. 16p. (UKC/COMPUTING LAB–63). Available from NTIS, PC EE04/MF E04.

The paper describes the performance of a multigrid method implemented on a transputer-based architecture. The authors show that the combination of fast floating-point hardware, local memory and fast communication links between processor provide an excellent environment for the parallel implementation of multigrid algorithms. The gain in efficiency obtained by increasing the number of processors is shown to be nearly linear and comparisons are made with published figures for a parallel multigrid Poisson solver on an Intel iPSC 32-node hypercube.

29898 (PB–90-154436/XAB) **Distributed ray tracing using an SIMD (single instruction multiple data) processor array.** Williams, N.S.; Buxton, B.F.; Buxton, H. British Petroleum Co. Ltd., Sunbury-on-Thames (UK). BP Research Centre. 1990. 24p. Available from NTIS, PC EE04/MF E04.

Recent work on distributed ray tracing algorithms using the Distributed Array Processor (DAP) will be described. It is shown that ray tracing algorithms are ideally suited to SIMD processor arrays because, once a set of rays has been cast from the viewpoint through pixels in the image plane, the origin and direction vectors which parameterize each ray from successive reflections can be mapped uniformly to the DAP processor array. Using an SIMD processor array in conjunction with the parallel algorithms presented, highly realistic graphics images can be produced in very short runtimes.

29899 (PB–90-154451/XAB) **Parallel matching and reconstruction algorithms in computer vision.** Kashko, A.; Buxton, B.; Castelow, D.A.; Buxton, H. Queen Mary Coll., London (UK). Dept. of Computer Science. 1987. 49p. Available from NTIS, PC EE05/MF E05.

Parallel implementations of a number of computer vision algorithms for visual reconstruction and matching are described. The algorithms chosen range in complexity from those requiring only image correlation and other simple operations to more sophisticated iterative algorithms involving relaxation, simulated annealing and graduated non-convexity. In each case the algorithms are implemented in parallel by mapping the images directly onto an SIMD processor array. Brief descriptions of the algorithms are given together with sample results and timings for their implementation on a 64 x 64 ICL DAP.

29900 (PB–90-155144/XAB) **Parallel approach for solving stiff systems of ODE's.** Khaddaj, S. Queen Mary Coll., London (UK). Dept. of Computer Science. 1990. 9p. Available from NTIS, PC EE04/MF E04.

The paper is concerned with the problem of speeding up the numerical solution of stiff systems of ordinary differential equations by parallel computations. The study focuses on parallelizing the solution of algebraic systems which arise at each step of the integration by standard implicit methods. An implementation of column-oriented Gauss-Jordan elimination on a multiprocessor machine is presented. Codes based on this approach are written in occam for solving different problems. Test results on the Meiko Computer Surface are reported.

29901 (PB–90-155227/XAB) **SIMD parallel version of the GLS optic flow algorithm.** Kashko, A. Queen Mary Coll., London (UK). Dept. of Computer Science and Statistics. 1987. 43p. Available from NTIS, PC EE05/MF E05.

A parallel version of Scott's optic flow algorithm on an SIMD architecture is described. Since the algorithm involves identical calculations at each pixel, there is a high degree of image parallelism which is exploited by the parallel program. Results obtained by running the algorithm on a test image of real data are presented, and the convergence of the algorithm is considered.

29902 (PB–90-157207/XAB) **Parallel relaxation labelling for optic flow.** Kashko, A. Queen Mary Coll., London (UK). Dept. of Computer Science and Statistics. 1989. 56p. Available from NTIS, PC EE06/MF E06.

Single Instruction Multiple Data (SIMD) parallel implementations of the classical relaxation labelling algorithm of Rosenfield and Kak, and the symmetrized algorithm of Ibison and Zapalowski for estimating optic flow are described and the performances of the two algorithms on a random dot kinematogram are compared.

29903 (PB–90-159823/XAB) **Federal High-Performance Computing program.** Office of Science and Technology Policy, Washington, DC (USA). 8 Sep 1989. 89p. Available from NTIS, PC A05/MF A01.

High-Performance Computing is a pervasive and powerful technology for industrial design and manufacturing, scientific research, communications, and information management. Its goals are to maintain and extend U.S. leadership in high-performance computing, and encourage U.S. sources of production; encourage the pace of innovation in high-performance computing technologies by increasing their diffusion and assimilation into the U.S. science and engineering communities; and support U.S. economic competitiveness and productivity through greater utilization of networked high performance computing in analysis, design, and manufacturing.

29904 (PB–90-168303/XAB) **Concurrent constructive logic. Technical report series.** Holt, C.M. Newcastle upon Tyne Univ. (UK). Computing Lab. c Apr 1988. 21p. (NTU-CL/TRS–255). Available from NTIS, PC EE03/MF E03.

A constructive logic may be viewed as a means for applying the operations of logic to the general domain of values used in functional application, combining data and control structures. It is an algebra over a domain that has been partitioned into logical subdomains, e.g. T (true), U (undecided), and F (false). Pure logical functions respect the partitioning by mapping subdomains into subdomains; they satisfy truth tables. Quasi-logical functions satisfy truth tables except for specific classes of values; non-standard implication and equality are introduced as examples. Communication in a time-free expression is considered, in which the use of a name in one position is related by a logical function to its use in another position. Although it is possible to embed this kind of relation in the text of an expression, in many cases it is simpler to use a directed reference graph from uses to referents, in which each arc is associated with a logical value indicating whether or not that path is used in the determination of the value of the name. Time sequences are introduced using this as a basis, and communication among concurrent processes follows naturally.

29905 (PB–90-861063/XAB) **Multiple instruction-multiple data stream (MIMD) computer architecture. January 1977-January 1990 (A Bibliography from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1977-January 1990.** National Technical Information Service, Springfield, VA (USA). Feb 1990. 124p. Available from NTISPC N01/MF N01.

Supersedes PB–87-863007.

This bibliography contains citations concerning the design, development, and applications of multiple instruction, multiple data stream (MIMD) computers and computer architecture. Design aspects, parallel processing, and language considerations are among the topics discussed. MIMD interconnection network design, implementation, and analysis are included. Some attention is given to specific systems descriptions. (This updated bibliography contains 216 citations, 92 of which are new entries to the previous edition.)

29906 (PNL–7301) **Looking at large data sets using binned data plots.** Carr, D.B. Pacific Northwest Lab., Richland, WA (USA). Apr 1990. 52p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. Order Number DE90008206. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report addresses the monumental challenge of developing exploratory analysis methods for large data sets. The goals of the report are to increase awareness of large data sets problems and to contribute simple graphical methods that address some of the problems. The graphical methods focus on two- and three-dimensional data and common task such as finding outliers and tail structure, assessing central structure and comparing central structures. The methods handle large sample size problems through binning, incorporate information from statistical models and adapt image processing algorithms. Examples demonstrate the application of methods to a variety of publicly available large data sets. The most novel application addresses the"too many plots to examine" problem by using cognostics, computer guiding diagnostics, to prioritize plots. The particular application prioritizes views of computational fluid dynamics solution sets on the fly. That is, as each time step of a solution set is generated on a parallel processor the cognostics algorithms assess virtual plots based on the previous time step. Work in such areas is in its infancy and the examples suggest numerous challenges that remain. 35 refs., 15 figs.

29907 (RCNP-P–104) **Collection of reports on use of computation fund utilized in common in 1988.** Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. May 1989. 157p. (In Japanese). Order Number DE90777885. Available from NTIS (US Sales Only), PC A08/MF A01.

Nuclear Physics Research Center, Osaka University, has provided the computation fund utilized in common since 1976 for supporting the computation related to the activities of the Center. When this computation fund is used, after finishing the use, the simple report of definite form (printed in RCNP-Z together with the report of the committee on computation fund utilized in common) and the detailed report concerning the contents of computation are to be presented. In the latter report, English abstract, explanation of the results obtained by computation and physical contents, new development, difficult point and the method of its solution in computation techniques, subroutine and function used for computation and their functions and block diagrams and so on are included. This book is the collection of the latter reports on the use of the

computation fund utilized in common in fiscal year 1988. The invitation to the computation fund utilized in common is informed in December every year in RCNP-Z. (K.I.).

29908 (SAND–89-2244C) **Spline function smoothing and differentiation of noisy data on a rectangular grid.** Dohrmann, C.R (Sandia National Labs., Albuquerque, NM (USA)); Busby, H.R. Sandia National Labs., Albuquerque, NM (USA). [1990]. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9006124–2: Society for Experimental Mechanics conference, Albuquerque, NM (USA), 4-6 Jun 1990). Order Number DE90009319. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A method is presented for smoothing and differentiating noisy data given on a rectangular grid. The method makes use of a one-dimensional smoothing algorithm to construct the solution to an associated two-dimensional problem. Smoothing parameter selection is automated using a technique that does not require prior knowledge of the amount of noise in the data. Numerical examples are provided demonstrating the application of the method. 4 refs., 8 figs., 2 tabs.

29909 (SAND–89-2383C) **An acousto-optic image correlator with a throughput rate of 1000 templates per second.** Molley, P.A. Sandia National Labs., Albuquerque, NM (USA). 28 Mar 1990. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9004125–3: 8. SPIE's applications of artificial intelligence conference, Orlando, FL (USA), 17-19 Apr 1990). Order Number DE90009323. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A two dimensional image correlator based on acousto-optic (AO) and charge-coupled devices (CCDs) is described that can be built with existing technology to provide 1000 frames per second operation. In recent years, architectures have been developed that perform the two dimensional correlation utilizing one dimensional input devices. The input scene is loaded into the acousto-optic device (AOD) one line at time. This line is then correlated against all of the rows of a reference template introduced into the optical system using a one dimensional array of LEDs or laser diodes. However, it generally takes a much greater time to load the AO cell than it does to process the information. this latency time severely limits the maximum throughput rate of the processor. This paper introduces a new acousto-optic correlator implementation that overcomes this bottleneck so that processing can occur close to 100% of the time. A grayscale image correlator is proposed that can be built using present technology that can realistically achieve throughput rates on the order of 10^{12} operations per second. This translates to over 1000 correlations per second for input scenes with dimensions of 512 x 512 pixels and reference templates of size 64 x 64 pixels. 10 refs., 4 figs.

29910 (SAND–90-0249) **Paving: A new approach to automated quadrilateral mesh generation.** Blacker, T.D. (Sandia National Labs., Albuquerque, NM (USA)); Stephenson, M.B. Sandia National Labs., Albuquerque, NM (USA). Mar 1990. 56p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE90010244. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This paper presents a new mesh generation technique, paving, which meshes arbitrary 2-D geometries with an all-quadrilateral mesh. Paving allows varying element size distributions on the boundary as well as the interior of a region. The generated mesh is well formed (i.e., nearly square elements, elements perpendicular to boundaries, etc.) and geometrically pleasing (i.e., mesh contours tend to follow geometric contours of the boundary). In this paper we describe the theory behind this algorithmic/heuristic technique, evaluate the performance of the approach, and present examples of automatically generated meshes. 17 refs., 42 figs.

29911 (SOL–90-5) **A generalized complementarity problem in Hilbert space.** Yao, Jen-Chih. Stanford Univ., CA (USA). Systems Optimization Lab. Mar 1990. 5p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research; National Science Foundation. DOE Contract FG03-87ER25028. Order Number DE90009576. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

An existence theorem for a generalized complementarity problem over arbitrary closed convex cone in a Hilbert space is proved.

29912 (UCRL–52000-90-1/2) **Energy and Technology Review, January–February 1990.** Burnham, A.K.; Cabral, B.K. (eds.). Lawrence Livermore National Lab., CA (USA). [1990]. 62p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90010155. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This issue of Energy and Technology Review describes a number of the Laboratory's efforts and achievements in computerized scientific visualization. Each article describes a different visualization software and hardware system. The systems all share the common goal of relaying complex numerical information to scientists in a readily comprehensible form. They differ in two significant ways — how they render or generate the images, and the operational environment in which they function. The image-rendering technique chosen is usually determined by the desired quality, type, and cost of the images. The operating environment (e.g., the speed with which images must be generated, whether they are used locally or must be sent to remote locations) governs the level of image detail, the range of colors used, and other such characteristics. These constraints greatly influence the overall design of a visualization system. 49 figs.

29913 (UCRL–102052) **Using object-oriented analysis techniques to support system testing.** Zucconi, L. Lawrence Livermore National Lab., CA (USA). Mar 1990. 16p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9006164–1: 7. international conference on testing computer software, San Francisco, CA (USA), 21 Jun 1990). Order Number DE90009540. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Testing of real-time control systems can be greatly facilitated by use of object-oriented and structured analysis modeling techniques. This report describes a project where behavior, process and information models built for a real-time control system were used to augment and aid traditional system testing. The modeling techniques used were an adaptation of the Ward/Mellor method for real-time systems analysis and design [Ward85] for object-oriented development. The models were used to simulate system behavior by means of hand execution of the behavior or state model and the associated process (data and control flow) and information (data) models. The information model, which uses an extended entity-relationship modeling technique, is used to identify application domain objects and their attributes (instance variables). The behavioral model uses state-transition diagrams to describe the state-dependent behavior of the object. The process model uses a transformation schema to describe the operations performed on or by the object. Together, these models provide a means of analyzing and specifying a system in terms of the static and dynamic properties of the objects which it manipulates. The various models were used to simultaneously capture knowledge about both the objects in the application domain and the system implementation. Models were constructed, verified against the software as-built and validated through informal reviews with the developer. These models were then hand-executed. 6 refs.

29914 (UCRL–102263-Rev.1) **SISAL 1.2: An alternative to FORTRAN for shared memory multiprocessors.** Cann, D.; Feo, J. Lawrence Livermore National Lab., CA (USA). 20 Nov 1989. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-9006101–1-Rev.1: ACM SIGPLAN '90: conference on programming language design and implementation, White Plains, NY (USA), 20 Jun 1990). Order Number DE90005181. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The acquisition of parallel processors in the scientific community is increasing, but the difficulties of programming parallel machines persist. Two approaches have emerged: automatic parallelizing compilers for extant languages, and new languages that provide an easier-to-use and cleaner parallel programming model. Unfortunately most new languages have acquired a reputation for inefficiency because of their semantics. This paper compares the performance of SISAL 1.2, an applicative language for parallel numerical computations, and FORTRAN using the Livermore Loops.

We show that applicative programs when compiled using a set of powerful yet simple optimization techniques can achieve execution speeds comparable to FORTRAN, and can effectively exploit shared memory multiprocessors. 16 refs., 2 figs., 2 tabs.

29915 (UCRL–102872) **Coping with nonuniform Unix interfaces in designing a portable network driver.** Wolski, R. Lawrence Livermore National Lab., CA (USA). [1990]. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9006123–1: USENIX conference proceedings, Anaheim, CA (USA), 11-18 Jun 1990). Order Number DE90007651. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The need for portable software continues to increase, especially within the Unix community, where a uniform interface is assumed to exist. Unfortunately, system software (particularly that which executes as part of the kernel) often has not been written to take full advantage of the homogeneity offered by Unix. Further, there is a need even within the kernel for greater uniformity of interfaces. This paper describes some of the issues associated with the design and implementation of a kernel-level protocol driver which is portable among various Unix implementations. It also recommends areas where interfaces could be more uniform across implementations. 15 refs.

29916 (UCRL-JC–103143) **Implementing TCP/IP and a socket interface as a server in a message-passing operating system.** Hipp, E.; Wittzius, D. Lawrence Livermore National Lab., CA (USA). Mar 1990. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9004179–1: Cray users group conference, Toronto (Canada), Apr 1990). Order Number DE90009920. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The UNICOS 4.3BSD network code and socket transport interface are the basis of an explicit network server for NLTSS, a message passing operating system on the Cray YMP. A BSD socket user library provides access to the network server using an RPC mechanism. The advantages of this server methodology are its modularity and extensibility to migrate to future protocol suites (e.g. OSI) and transport interfaces. In addition, the network server is implemented in an explicit multi-tasking environment to take advantage of the Cray YMP multi-processor platform. 19 refs., 5 figs.

29917 (UCRL-MA–103419) **SPI/VMS installation guide.** King, M.E. Lawrence Livermore National Lab., CA (USA). 12 Mar 1990. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90009955. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This document provides information on how to install SPI/VMS. This product runs on VMS Version 5.1 and above. The SPI.BCK saveset contains all the files necessary to run and compile SPI/VMS. This document assumes that you have a copy of the saveset on a magnetic tape or in a directory on a Files-11 disk.

29918 Optical recognition of 3-D targets. Schils, G.F. (Sandia National Labs., Livermore, CA (USA)); Ochoa, E. pp. 257 of Real-time signal processing for industrial applications. Javidi, B. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). (CONF-8806355–: Real time signal processing for industrial applications, Dearborn, MI (USA), 27-28 Jun 1988).

A method of pattern recognition is presented that can recognize image variations such as different perspective views of a three-dimensional object. The general theory allows many different kinds of image variations, such as rotation, scale. perspective, or combinations of these, to be recognized. The method produces a small bank of about 20 filters to be used in a correlator. The authors call these filters lock-and-tumbler filters. The theory is illustrated on several different kinds of invariant pattern recognition problems. The correlation filters designed for these invariant recognition problems may be modified to reject certain kinds of clutter in an input scene. An example of modifying these filters to achieve rejection of clutter is given. An implementation of the lock-and-tumbler filter method using a high speed digital correlator is described.

29919 Basis: Setting the scientist free. Dubois, P.F. (Lawrence Livermore National Lab., CA (USA)). pp. 180 of Proceedings of the 1989 IEEE International conference on plasma science (Abstracts). IEEE Service Center, Piscataway, NJ (USA) (1989). DOE Contract W-7405-ENG-48. (CONF-8905184–: Institute of Electrical and Electronics Engineers international conference on plasma science, Buffalo, NY (USA), 22-24 May 1989).

The author presents Basis, a program development system for scientific programs. It is available on Cray machines and Sun workstations, with other environments to follow. The Basis System includes two major components, a program development system and a run-time package. The run-time package provides the Basis language interpreter, through which the user does input, output, plotting, and controls the program's subroutines and functions. Variables in the scientific packages are known to this interpreter, so that the user may arbitrarily print, plot, and calculate with, any major program variables. Also provided are facilities for dynamic memory management, terminal logs, error recovery, text-file i/o, and the attachment of non-Basis-developed packages.

29920 Systolic implementation of neural networks. DeGroot, A.J. (Lawrence Livermore National Lab., Livermore, CA (USA)). pp. 261 of High speed computing II. Bromley, K. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1989). DOE Contract W-7405-ENG-48. (CONF-8901150–: 2. high speed computing, Los Angeles, CA (USA), 17-18 Jan 1989).

The backpropagation algorithm for error gradient calculations in multilayer, feed-forward neural networks is derived in matrix form involving inner and outer products. It is demonstrated that these calculations can be carried out efficiently using systolic processing techniques, particularly using the SPRINT, a 64-element systolic processor developed at Lawrence Livermore National Laboratory. This machine contains one million synapses, and forward-propagates 12 million connections per second, using 100 watts of power. When executing the algorithm, each SPRINT processor performs useful work 97% of the time. The theory and applications are confirmed by some nontrivial examples involving seismic signals recognition.

29921 A pnpn optical switch. Pankove, J.I. (Colorado Univ., Boulder, CO (USA). Dept. of Computer Science); Hayes, R.; Majefeld, A.; Hannaa, M.; Oh, E.G.; Szmyd, D.M.; Suda, D.; Asher, S.; Matson, R. pp. 732 of Optical computing 88. Goodman, J.W.; Chavel, P.; Roblin, G. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). (CONF-8808221–: Optical computing '88, Toulon (France), 29 Aug - 2 sep 1988).

The pnpn optical switch is an optoelectronic device that emits light in response to an optical input while an electrical bias is applied. A clocked bias insures synchronization. Other modes of operation are possible. The authors report pnpn structures fabricated by different techniques. Turn-on and turn-off times of less than 10 nsec have been obtained. High optical gain is possible. Some logic functions can be accomplished within this threshold device.

29922 Partitioning programs for parallel execution. Girkar, M. (Illinois Univ., Urbana, IL (USA). Center for Supercomputing Research and Development); Polychronopoulos, C. pp. 687 of 1988 international conference on supercomputing. Association for Computing Machinery, New York, NY (USA) (1988). (CONF-8807116–: International conference on supercomputing, Saint-Malo (France), 4-8 Jul 1988).

The ability of parallel computers to execute multiple instruction streams (tasks) simultaneously gives rise to the problem of partitioning a program into a set of tasks that can be assigned to different processors.The degree to which parallelism can be exploited, the amount of overhead involved during parallel execution of a program and a number of other factors depend directly on partitioning. A good partitioning scheme must take into account all these factors. In this paper, the authors present algorithms to compute partitions in diverse models of the problem. Both directed and undirected graph representations of a parallel program are considered. For some instances of the problem where practical optimal schemes are not possible, the authors suggest simple and efficient heuristics. Finally, a polynomial time algorithm to compute optimal partitions for chains is given.

29923 Hierarchical registers for scientific computers. Swensen, J.A. (California Univ., Berkeley, CA (USA)). pp. 687 of 1988 international conference on supercomputing. Association for Computing Machinery, New York, NY (USA) (1988). (CONF-8807116–: International conference on supercomputing, Saint-Malo (France), 4-8 Jul 1988).

Simulations of scientific programs running on traditional scientific computer architectures show that execution with hundreds of registers can be more than twice as fast as execution with only eight registers. In addition, execution with a small number of fast registers and hundreds of slower registers can be as fast as execution with hundreds of fast registers. A hierarchical organization of fast and slow registers is presented, register-allocation strategies are discussed, and an indirect, register-addressing mechanism is described.

29924 Performance of a shared memory system for vector multiprocessors. Turner, S.W. (Univ. of Illinois (US)); Veidenbaum, A.V. pp. 687 of 1988 international conference on supercomputing. Association for Computing Machinery, New York, NY (USA) (1988). MIP8414-10110. (CONF-8807116–: International conference on supercomputing, Saint-Malo (France), 4-8 Jul 1988).

In this paper the authors present results showing the behavior of not only a MIN but of an entire shared memory system obtained through simulation. They attempts to evaluate the performance and interaction between components of such a system, based on realistic hardware assumptions and driven by user programs. To achieve this they have developed a parallel register-transfer level simulator of interconnection networks and an interleaved shared memory. The simulator itself runs on a multiprocessor (Alliant FX/8). The authors study non-uniform, burst traffic as exhibited by prefetch or vector units in each processor. Because the exact behavior of the hardware is simulated, they also obtain a time dependent description of system performance. In the first part of this paper the authors describe the system being studied. They define the metrics used to evaluate the performance of the system. The benchmarks used in this evaluation are then discussed. The results of the experiment are presented, and conclusions drawn. Attached appendices contain listings of the kernels used, as well as a table summarizing the exact values of performance measures presented.

29925 Impact of self-scheduling order on performance of multiprocessor systems. Tang, P. (Illinois Univ., Urbana, IL (USA). Center for Supercomputing Research and Development); Yew, P.C.; Qizhu, C. pp. 687 of 1988 international conference on supercomputing. Association for Computing Machinery, New York, NY (USA) (1988). (CONF-8807116–: International conference on supercomputing, Saint-Malo (France), 4-8 Jul 1988).

Processor self-scheduling is an efficient dynamic scheduling for multiprocessors. This paper discusses the impact of the self-scheduling order on the performance of multiply-nested parallel loops. It is shown that, due to data synchronization for cross-iteration data dependences, the completion time of a multiply-nested loop is reduced when the nesting parallel loops with smaller delays are moved to the inside. The best performance is achieved when a shortest-delay scheduling order is used. The performance of the shortest-delay self-scheduling is compared to other self-scheduling orders and to compile-time static scheduling order proposed elsewhere. Program transformation needed to implement shortest-delay self-scheduling is also included.

29926 A benchmark package for sparse matrix computations. Saad, Y. (Illinois Univ., Urbana, IL (USA). Center for Supercomputing Research and Development); Wijshoff, A.G.H. pp. 687 of 1988 international conference on supercomputing. Association for Computing Machinery, New York, NY (USA) (1988). (CONF-8807116–: International conference on supercomputing, Saint-Malo (France), 4-8 Jul 1988).

The authors examine the problem of evaluating performance of supercomputer architectures on sparse (matrix) computations and lay out the details of a benchmark package for this problem. Whereas there already exists a number of benchmark packages for scientific computations, such as the Livermore Loops, the Linpack benchmark and the Los Alamos benchmark, none of these deals with the specific nature of sparse computations. Sparse matrix techniques are characterized by the relatively small number of operations per data element and the irregularity of the computation. Both facts may significantly increase the overhead time due to memory traffic. For this reason, the performance evaluation of sparse computations should not only take into account the CPU performance but also the degradation of performance caused by high memory traffic. Furthermore, sparse matrix techniques comprise a variety of different types of basic computations. Taking these considerations into account they propose a benchmark package that consists of several independent modules, each of which has a distinct role.

29927 The design and evaluation of a front-end user interface for energy researchers. Borgman, C.L. (Univ. of California, Los Angeles (USA)); Case, D.O.; Meadow, C.T. *Journal of the American Society for Information Science (USA)*, 40(2): 99-109 (Mar 1989).

The report covers a two-year project to develop a set of microcomputer-based training and assistance programs to support end user access to the Energy Database on the Department of Energy information retrieval systems. A set of programs were designed and tailored to the information needs, skills and information-seeking habits of energy researchers. Discussion covers the issues in development, evaluation and study of user behavior in designing an interface tailored to a special population. Some background information is provided on information systems and database use. 32 refs.

29928 Online access to knowledge: System design. Meadow, C.T. (Univ. of Toronto, Ontario (Canada)); Cerny, B.A.; Borgman, C.L., Case, D.O. *Journal of the American Society for Information Science (USA)*, 40(2): 86-98 (Mar 1989). DOE Contract AC05-80OR11232.

The project Online Access to Knowledge (OAK) has developed a computer intermediary for selected users of the Department of Energy's (DOE) online information retrieval systems. Its purpose is to enable people who have little or no training or experience in bibliographic searching to conduct their own searches, without the assistance of a trained librarian. This permits the user to work in both a place and time of their choosing. This report discusses the design and rationale for the system. OAK software consists of both a tutorial and an assistance program. A command language is not used, which obviates the need for a searcher to learn a formal query language. 20 refs.

29929 Error analysis for parameters determined in nonlinear least-squares fits. Burrell, K.H. (General Atomics, San Diego, California 92138 (US)). *American Journal of Physics (USA)*, 58(2): 160-164 (Feb 1990). DOE Contract AC03-84ER51044.

This article presents a calculation of the error in parameters derived from the least-squares method of fitting nonlinear models to experimental data. The formula reduces to the well-known result for the case of a linear least-squares fit. It differs, however, from a method for calculating the error that is often employed for the nonlinear case. The difference between the current result and that method's is illustrated with examples from least-squares fits to spectroscopic data.

29930 (ANL/EAIS/TM–7) **Records management modernization study.** Kadec, S.; Hill, L.G.; Riemer, C.A. Argonne National Lab., IL (USA). Environmental Assessment and Information Sciences Div. Dec 1989. 95p. Sponsored by Veterans Administration. DOE Contract W-31109-ENG-38. Order Number DE90009372. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

The Department of Veterans Affairs (VA) has a single purpose or mission: to provide benefits to the veterans of the nation. Most of these benefits are provided through its medical and health facilities located around the country: the hospitals, nursing homes, and clinics that give medical examinations and provide long-term care or

hospitalization. A second sizeable program managed by the Veterans Benefit Administration (VBA) gives pensions, benefits for disability and education, insurance, and home loans to those veterans eligible under law and specific service conditions. In support of the benefits programs, VA staff in the regional offices (ROs) receive and create a large amount of documentation. This documentation supports the award or disallowance of benefits by providing the information necessary to determine eligibility and the amount of the award. This paperwork, which is necessary to document actions and support the appeals process, creates a huge record-keeping problem for the ROs. 6 tabs.

29931 (DOE/DP/70033–4-Vol.1) **Research and development of models and instruments to define, measure, and improve shared information processing within government oversight agencies: Volume 1, 4th annual performance report: research status, August 1989–July 1990.** Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (USA). Management Systems Labs. [1990]. 196p. Sponsored by U.S. DOE Defense Programs. DOE Contract FG05-86DP70033. Order Number DE90009989. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

Plans to study is at the very forefront of information systems and management research. The first phase of the research objective is exploratory. Exploratory research is longitudinal. During this phase of research, we form objectives, construct qualitative models, emphasize defining relationships and comparisons, make observations to draw implications, corroborate findings, and define directions. The second and third phases are confirmatory. Confirmatory research is cross-sectional. Through confirmatory research we form hypotheses, construct quantitative models, emphasize measurement and evaluation, set up and run experiments, verify results, and draw conclusions. This annual performance report describes the previous years' research efforts and the plan for the upcoming year.

29932 (ORNL/TM–11534) **Subject bibliography of the PMA205 [Program Manager Air 205] Network Technical Library at Oak Ridge National Laboratory.** Ayers, M.V. Oak Ridge National Lab., TN (USA). 1 May 1990. 109p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90009988. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The PMA205 (Program Manager Air 205) Network Technical Library at the Oak Ridge National Laboratory (ORNL) contains documents relating to US Department of Defense standards for computer-based training technology and training and American National Standards Institute international standards for user interfaces and Computer-Aided Acquisition and Logistic Support. The collection emphasizes supporting research in instructional system design, software engineering, user system interfaces, human factors engineering, and cognitive psychology as it differentiates between higher and lower cognitive tasking. The collection currently consists of about 670 documents of various types. These include military standards and specifications, reports, conference proceedings, dissertations, technical manuals, books, journal articles, and military instructions and directives. The documents have been added to the library as the result of literature searches and personal submission from team members. It is a selective collection and not a comprehensive one. A database, written in Procite/PC, contains the cataloged holdings of the library. Each record contains the bibliographic information and an abstract. The database provides access to information in the records by either full text searches using Boolean logic or individual field searching. One-word "quick searches" can be performed on the date, title, or author fields. The browsing capability for retrieved items is by full record or brief format. Search results can be read from the screen, printed to hard copy, or transferred to a disk file for later use. Disks containing the database and printed bibliographies are available to PMA205 network team members upon request.

29933 (SAND–89-2813C) **Developing a connector selection database application using NIAM [Nijssen's Information Analysis Methodology].** Sevier, N.E. Sandia National Labs., Albuquerque, NM (USA). [1990]. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-900580–4: 1990 Digital Equipment Corporation User's Society meeting, New Orleans, LA (USA), 7-11 May 1990). Order Number DE90009971. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Nijssen's Information Analysis Methodology (NIAM) is a conceptual information modeling technique that provides a database applications designer with the tools and guidance to develop database applications that accurately depict users needs in a timely manner. The steps involved are: information gathering; information modeling; transformation; data input; and user interface development. This talk will describe how these steps were used to create a connector selection database application. The information gathering step will describe where the information regarding connectors was found. The information modeling step will explain how the information was depict utilizing a NIAM information structure diagram. The transformation step will demonstrate how an information structure diagram can be directly translated into database record structures. The data input step will address methods for capturing all the data. Finally the user interface step will describe the basic user interface along with methods for integrating help text and graphics with a DBMS. 7 refs., 2 figs.

29934 (UCRL–102749) **Pattern classification using self-organizing feature maps.** Lu, Shin-yee. Lawrence Livermore National Lab., CA (USA). Jan 1990. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-9006136–1: International conference on neural networks, San Diego, CA (USA), 17-21 Jun 1990). Order Number DE90008321. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In this paper, we demonstrate the use of self-organizing feature maps as pattern classifiers. When a set of training patterns is presented to a self-organizing network repeatedly for many iterations, the weight vectors gradually organize themselves to be the cluster centers of these patterns. In the one dimensional case, they can arrange themselves to satisfy a linear ordering relation. That is, the distance between two weight vectors increases as the physical distance between the two corresponding output nodes increases. However, the latter is true only when an adequate size of neighborhood is used in the network. We notice a cyclic phenomenon among the distances between weight vectors, when the size of the neighborhood is small. 5 refs., 7 figs., 5 tabs.

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in *DOE Energy Data Base: Corporate Author Entries* (DOE/TIC-4585). Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, also abbreviated; and (3) the language of the document if non-English (R;US;In French). Author affiliations are not listed in this index.

810 Future plans, 15:29517 (R;US)
AGS silicon gold collisions measured in the E-810 TPC [Time Projection Chamber], 15:29538 (R;US)
Assessment of thermal fatigue crack propagation in safety injection PWR lines, 15:28041 (R;US)
Dynamic strain gages analysis of critical welds used in power plant circuit breakers, 15:28943 (R;US)
H^{minus} source and low energy transport for the BNL RFQ preinjector, 15:28844 (R;US)
Is life a critical phenomenon?, 15:29112 (R;US)
On the investigation of cracking in safety injection PWR lines due to thermal stratification, 15:27962 (R;US)
Report of the workshop on the proposed pulse radiolysis facility at Brookhaven National Laboratory, September 8th and 9th, 1989, 15:28677 (R;US)
Secondary interactions in HIJET, 15:29545 (R;US)
Solving global environmental problems through technological innovation, 15:28984 (R;US)
Synchrotron injectors based on high charge state ion sources, 15:28843 (R;US)
The efficiencies and error-rates of Euclidean and Mahalanobis searches in hypergeometries of archaeological ceramic compositions, 15:28464 (R;US)
Ultra high temperature particle bed reactor design, 15:28034 (R;US)
V^0 production with 14.5 GeV/c silicon beams, 15:29445 (R;US)

Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene
Thermoluminescence and chemiluminescence measurements for detection of radiation treatment of spices: A European interlaboratory comparison, 15:28678 (R;DE;In German)

Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)
Development of a 10 kHz 16 μm laser system for uranium enrichment (phase I, 1988), 15:27660 (R;DE;In German)
Development of processes for disposal of transformers using askarel and planning of pilot plant. Final report, 15:28297 (R;DE;In German)

Electrocoagulation of fission product colloids in dissolver solutions from reprocessing of nuclear fuel with high burnup, 15:27669 (R;DE;In German)
Examination of irradiated MOX test fuel rods with second-generation plutonium, 15:27957 (R;DE;In German)
Green solar architecture. Results of measurements and energy analysis of two solar houses in Tuebingen, 15:27866 (R;DE;In German)
Methods and models on soil conservation for the estimation of burdenings and for risk assessment of pollution. Status and demand on research, 15:29046 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Landstuhl, 15:28235 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Homburg, 15:28236 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Holzkirchen, 15:28237 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the conventionally built reference house near Holzkirchen, 15:28238 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Waldmoor, 15:28239 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private houses - results of measurements and energy analysis of five solar houses with identical floor plans in Landstuhl, 15:28240 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of three solar houses in Landstuhl with identical floor plans, 15:28241 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Altenstadt, 15:28242 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Issum, 15:28243 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Ingelheim, 15:28244 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Woellstein, 15:28245 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the conventional reference house in Zirndorf, 15:28246 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Zirndorf-Weiherhof, 15:27864 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Darmstadt, 15:27865 (R;DE;In German)
Upgrading of Venezuelan heavy crude. Continuation of the Orinoco feasibility study within the Venezuelan-German Agreement (Annex IIIB). Final report, 15:27558 (R;DE)

Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.)
Comparison of three Kr-85 separation processes of a 350 t/y fuel reprocessing plant with special reference to radiation doses. Vol. 2 and 3, 15:27661 (R;DE;In German)
Concepts of computer-aided environmental radioactivity monitoring within the framework of the Integrated Measurement and Information System (IMIS) of the BMU, 15:28983 (R;DE;In German)
Evaluation and analysis of documents with a view to safety-relevant problems, and consideration of these problems in the amendment of the Nuclear Engineering Code. 4. Technical report. Calculation of the rupture load of pipes and containers with longitudinal and circumferential defects, 15:28036 (R;DE;In German)
Participation of the GRS in the 'Degraded piping program' of the USNRC, 15:28037 (R;DE;In German)
Safety analysis of pipelines during loads from external effects and during unforeseeable operating and incidental loads, 15:28039 (R;DE;In German)
Study of the organizational structure of nuclear power plants and their coordination with supervisory organizations and structures. Pt. 1. Accident management in nuclear power plants, 15:28040 (R;DE;In German)
Study on the load event aircraft crash on nuclear power plants. Phase 2, 15:28038 (R;DE;In German)

Bureau of Mines, Denver, CO (USA). Denver Research Center
Subsidence monitoring using seismic activity. Final report, 15:27480 (R;US)

Bureau of Mines, Pittsburgh, PA (USA). Pittsburgh Research Center
Determining the relative toxicity and smoke obscuration of combustion products of mine combustibles. Report of Investigations/1990, 15:29001 (R;US)
Evaluation of water-jet-assisted cutting capability on longwall shearers. Report of Investigations/1989, 15:27479 (R;US)
Field evaluation of three longwall pillar systems in a Kentucky coal mine. Report of Investigations/1989, 15:27481 (R;US)
Pressure monitoring and observed effects of mining at the Oak Grove, AL. Coalbed degasification pattern. Report of investigations/1989, 15:27433 (R;US)

Bureau of Mines, Twin Cities, MN (USA). Twin Cities Research Center
Control of diesel particulate matter in underground coal mines. Report of Investigations/1989, 15:27522 (R;US)

Heat Pump and Appliance Research: Research status report 1985-1986, 15:28255 (R;US)
Heat Pump and Appliance Research: Status report 1984-1985, 15:28257 (R;US)
Industrial Utilization research and development status report: 1985-1986, 15:28256 (R;US)
Industrial Utilization research and development status report: 1984-1985, 15:28258 (R;US)
Industrial Utilization research and development. status report, July 1983 to July 1984, 15:28259 (R;US)
Methanol demand, supply, and prices: 1970-2000, 15:27830 (R;US)
Natural Gas Supply Subprogram. Status report, 1985, 15:27590 (R;US)
Policy implications of the GRI (Gas Research Institute) baseline projection of US energy supply and demand to 2010, 1989, 15:27614 (R;US)
Research and development results for 1984, 15:27581 (R;US)
SNG (Substitute Natural Gas) supply research program status report. December 1985, 15:27431 (R;US)
Transport and Storage (3.3) Subprogram for Gas Research Institute: Status report, 1985, 15:27636 (R;US)

Gas Research Inst., Chicago, IL (USA). Strategic Planning and Analysis Div.
The long-term trends in US gas supply and prices: The 1989 GRI baseline projection of US energy supply and demand to 2010, 15:27610 (R;US)

Gas Research Inst., Washington, DC (USA). Strategic Analysis and Energy Forecasting Div.
Baseline projection data book: 1988 GRI (Gas Research Institute) baseline projection of US energy supply and demand to 2010, 15:27613 (R;US)

General Atomics Co., San Diego, CA (USA)
Three-dimensional simulations of simple electron drift wave turbulence in tokamak geometry, 15:29630 (R;US)

General Atomics, San Diego, CA (USA)
Parasitic coupling of the fringing fields of an Ion-Bernstein wave antenna, 15:29631 (R;US)

Geoexplorers International, Inc., Denver, CO (USA)
Geological evolution and analysis of confirmed or suspected gas hydrate localities: Volume 15, Evaluation of geological relationships to gas hydrate formation and stability, Summary report: Final report, 15:27586 (R;US)

Geological Survey, Denver, CO (USA)
Distribution of natural gas and reservoir properties in the continental crust of the United States. Final report, June 15, 1988-June 15, 1989, 15:27591 (R;US)

Geological Survey, Tuscaloosa, AL (USA)
Establishment of an oil and gas database for increased recovery and characterization of oil and gas carbonate reservoir heterogeneity: [Progress report], January 1, 1990–March 31, 1990, 15:27526 (R;US)

George Mason Univ., Fairfax, VA (USA). Center for Behavioral and Cognitive Studies
Basic considerations in predicting error probabilities in human task performance, 15:28069 (R;US)

Georgetown Univ., Washington, DC (USA). School of Medicine
Key involvement of poly (ADP-ribosylation) in defense against toxic agents in molecular biology studies. Annual report, November 1988-November 1989, 15:29113 (R;US)

Georgia Inst. of Tech., Atlanta, GA (USA)
Bootstrap current studies in the Advanced Toroidal Facility, 15:29626 (R;US)
Evaluation of upper-shelf toughness requirements for reactor pressure vessels: Final report, 15:27978 (R;US)
Feasibility analysis of reciprocating magnetic heat pumps. Final report, 15:28703 (R;US)

Geraghty and Miller Modeling Group, Reston, VA (USA)
Evaluation of closure capping on groundwater flow and solute transport at the General Separations Area: Flow model and particle-tracking analysis of closure caps with runoff, 15:27745 (R;US)

Gesellschaft fuer Reaktorsicherheit mbH (GRS), Garching (Germany, F.R.)
Compilation of transfer factors and ecological parameters for calculation of radionuclide transport through food chains, 15:29045 (R;DE;In German)

Gesellschaft fuer Reaktorsicherheit mbH (GRS), Koeln (Germany, F.R.)
Participation of the GRS in the 'Degraded piping program' of the USNRC, 15:28037 (R;DE;In German)
Safety analysis of pipelines during loads from external effects and during unforeseeable operating and incidental loads, 15:28039 (R;DE;In German)
Surveys of research projects concerning nuclear facility safety, financed by the Federal Ministry for the Environment, Nature Protection and Reactor Safety, 1988. 13. annual report on SR-projects, 15:28057 (R;DE;In German)

Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.)
High current metal ion beam transport in the UNILAC injector at GSI, 15:28850 (R;DE)

Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU)
1st PBWU status seminar on forest decline. Proceedings, 15:29198 (R;DE;In German)

GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany, F.R.)
A study on the transport of pollutants through the Hamburg harbour, 15:29067 (R;DE)
Investigations of fertilizer phosphates for minor and trace elements by means of instrumental neutron activation analysis (INAA), 15:28599 (R;DE;In German)
Investigations of the resuspension behaviour of estuarine suspended matter, 15:29068 (R;DE;In German)
Modeling of the brackish water dynamics of the lower Elbe estuary, 15:29069 (R;DE;In German)

Goodman Engineers, Inc., Little Rock, AR (USA)
DOE grant for assessment of district cooling system for University of Arkansas for Medical Sciences, Little Rock, Arkansas, 15:28231 (R;US)

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR)
Nuclear spectroscopy and nuclear structure. Electromagnetic transitions in atomic nuclei: Summaries of report, 15:29506 (R;SU;In Russian)

Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)
Properties of light nuclei very far from beta stability, 15:29519 (R;FR)
Some properties of the β-delayed charged particle emission of ^{39}Ti and ^{40}Ti, 15:29534 (R;FR)

Greatbatch (Wilson) Ltd., Clarence, NY (USA)
Feasibility of a superhigh energy-density battery of the Li/BrF_3 electrochemical system. Progress report, 15 October-15 December 1989, 15:28106 (R;US)
Feasibility of a superhigh energy-density battery of the Li/BrF_3 electrochemical system. Technical report, 15:28107 (R;US)

H

Hamburg Univ. (Germany, F.R.). Fachbereich Geowissenschaften
Modeling of the brackish water dynamics of the lower Elbe estuary, 15:29069 (R;DE;In German)

Hannover Univ. (Germany, F.R.). Inst. fuer Technik in Gartenbau und Landwirtschaft
Planning aids for the use of electric appliances in greenhouse horticulture, 15:28284 (R;DE;In German)

Harvard Univ., Petersham, MA (USA). Harvard Forest
Structure and function of Frankia vesicles in dinitrogen fixing actinorhizal plants: Final report, April 1, 1984–December 31, 1989, 15:29114 (R;US)

Hawaii Natural Energy Inst., Honolulu, HI (USA)
Cogeneration in the Hawaiian sugar industry, 15:28287 (R;US)

Helsinki Univ. of Technology, Otaniemi (Finland). Inst. of Energy Engineering
Experimental research of pressurized fluidized bed technology and its application to power and heat cogeneration: Summary, 15:27505 (R;FI;In Finnish)

Helsinki Univ. of Technology, Otaniemi (Finland). Lab. of Heating, Ventilation and Air Conditioning
An impact of the use of return air on comfort and health of employees in an office building, 15:28267 (R;FI;In Finnish)

Hiroshima Univ., Takehara (Japan). Research Inst. for Theoretical Physics
Aspects of perturbed conformal field theory, affine Toda field theory and exact S-matrices, 15:29495 (R;JP)
Role of exotic mesons in nonleptonic weak decays of strange and charm mesons, 15:29473 (R;JP)
Some aspects of quantum groups and supergroups, 15:29494 (R;JP)
Teichmueller motion of (2+1)-dimensional gravity with the cosmological constant, 15:29332 (R;JP)
Unified approach to weak decays of strange and charm mesons into two pseudoscalar mesons and the role of exotic mesons, 15:29474 (R;JP)

Hittman Associates, Inc., Columbia, MD (USA)
Economic evaluation of OSM (Office of Surface Mining) hydrology, geology, and air resources regulations. Final report, 15:27513 (R;US)
Economic evaluations of OSM (Office of Surface Mining) agronomic and biological sciences regulations (prime farmlands). Final report, 15:27458 (R;US)

Hoenheim Univ., Stuttgart (Germany, F.R.). Inst. fuer Tiermedizin und Tierhygiene mit Tierklinik
Assessment of sewage sludge treatment processes for the purpose of determining technical operating parameters, 15:28340 (R;DE;In German)

Holditch (S.A.) and Associates, Inc., College Station, TX (USA)
Tight gas sands research program: Field operations and analysis. Analysis of selected wells surrounding SFE No. 3, Waskom Cotton Valley Field, Harrison County, Texas. Topical report, 15:27592 (R;US)

I

ICF Resources, Inc., Fairfax, VA (USA)
Technical analysis and program management support of the tight gas sands project area. Annual report, November 1987-October 1988, 15:27587 (R;US)

Idaho National Engineering Lab., Idaho Falls, ID (USA)
The potential of renewable energy: An interlaboratory white paper, 15:28122 (R;US)

Idaho Univ., Moscow, ID (USA). Coll. of Mines and Earth Resources
Electrochemistry of Thiobacillus ferrooxidans reactions with pyrite: Technical annual report, September 1989–January 1990, 15:27426 (R;US)

IEA Coal Research, London (UK)
Current and prospective Australian coal supply, 15:27509 (R;GB)
Management of AFBC [atmospheric fluidised bed combustion] residues, 15:27494 (R;GB)

Illinois Dept. of Energy and Natural Resources, Springfield, IL (USA)
Research on improved and enhanced oil recovery in Illinois through reservoir characterization: Technical progress report, December 29, 1989–March 28, 1990, 15:27525 (R;US)

Illinois Environmental Protection Agency, Springfield, IL (USA). Div. of Land Pollution Control
Available disposal capacity for solid waste in Illinois: Third annual report, 15:29098 (R;US)

Illinois Inst. of Natural Resources, Champaign, IL (USA). Illinois Natural History Survey
Chemical and toxicological analyses of Lake Calumet (Cook County, Illinois) sediments, 15:29084 (R;US)

Illinois Univ., Chicago, IL (USA). Dept. of Civil Engineering, Mechanics, and Metallurgy
Oxidation of cobalt-chromium alloys in chlorine contaminated environments, 15:28392 (R;US)

Illinois Univ., Urbana, IL (USA)
Characterization of biofilm community structure by ribosomal RNA sequences. Annual report, 1 December 1988-30 November 1989, 15:27802 (R;US)
Iii-v semiconductor quantum-well lasers and related optoelectronic devices on silicon. Technical report, 15:28745 (R;US)
Spray-dryer spent-sorbent hazardous-waste fixating and cementitious properties, 15:27446 (R;US)

Illinois Univ., Urbana, IL (USA). Dept. of Physics
Hadroproduction of $D^* \rightarrow (K\pi)\pi$, 15:29449 (R;US)

Illinois Univ., Urbana, IL (USA). Dept. of Plant Biology
[Structure and expression of nuclear genes encoding rubisco activase]: Progress report, 15:29164 (R;US)

Imatran Voima Oy (IVO), Helsinki (Finland)
The development project for a dual-fuel gas-diesel power plant; Part II, 15:28700 (R;FI;In Finnish)

Inco Alloys International, Inc., Huntington, WV (USA)
Effect of different thermal treatments on the corrosion resistance of alloy 690 tubing: Final report, 15:27999 (R;US)

Industrieanlagen-Betriebsgesellschaft mbH, Ottobrunn (Germany, F.R.)
Study on the load event aircraft crash on nuclear power plants. Phase 2, 15:28038 (R;DE;In German)

Industry, Science and Technology Canada, Ottawa, ON (Canada)
Fluids-handling and mechanical power-transmission equipment, 15:28124 (R;CA)

Informationszentrum Raum und Bau der Fraunhofer-Gesellschaft (IRB), Stuttgart (Germany, F.R.)
Green solar architecture. Results of measurements and energy analysis of two solar houses in Tuebingen, 15:27866 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Landstuhl, 15:28235 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Homburg, 15:28236 (R;DE;In German)

Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Holzkirchen, 15:28237 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the conventionally built reference house near Holzkirchen, 15:28238 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Waldmoor, 15:28239 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private houses - results of measurements and energy analysis of five solar houses with identical floor plans in Landstuhl, 15:28240 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of three solar houses in Landstuhl with identical floor plans, 15:28241 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Altenstadt, 15:28242 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Issum, 15:28243 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Ingelheim, 15:28244 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Woellstein, 15:28245 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the conventional reference house in Zirndorf, 15:28246 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Zirndorf-Weiherhof, 15:27864 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Darmstadt, 15:27865 (R;DE;In German)

Instatherm Co., Cary, NC (USA)
Fuel savings in the heavy trucking industry through cool storage: Technical progress report, third project quarter, December 20, 1989–March 19, 1990, 15:28280 (R;US)

Institut National Polytechnique, 54 - Nancy (France)
Adsorption of gas mixtures on fixed bed. Application to fuel-gas valorisation, 15:27557 (R;FR;In French)
Falling film evaporators: organic solvent regeneration in nuclear fuel reprocessing, 15:27664 (R;FR;In French)
Respective influence of thermodynamic, hydrodynamic and diffusion factors on ion exchanger operation. Application to the ion exchanger NYMPHEA, 15:27690 (R;FR;In French)
Study of mechanisms accompanying ionic surfactant adsorption on solids for low interaction systems. Application to chemical enhanced oil recovery in sandstone deposits, 15:27555 (R;FR;In French)

Institute of Gas Technology, Chicago, IL (USA)
Review of automated custody transfer equipment for large-volume gas flow measurement. Final report, August 1, 1987-February 28, 1988, 15:27635 (R;US)

Institute of Nuclear Physics, Cracow (Poland)
"Ottawa Sand", "Royer Dolomite" and "Dunite Sand" as reference samples for the thermal neutron absorption cross-section, 15:29569 (R;PL)

Institute of Occupational Medicine, Edinburgh (UK)
Development of a prototype powered helmet respirator suitable for use in coal mines. Final report, July 1987-June 1988, 15:27516 (R;GB)

INTERA, Inc., Austin, TX (USA)
Analysis of the fluid-pressure responses of the Rustler Formation at H-16 to the construction of the air-intake shaft at the Waste Isolation Pilot Plant (WIPP) site, 15:27734 (R;US)

International Science and Technology, Inc., Sterling, VA (USA)
Evaluation of stream liming effects on water quality and spawning of migratory fishes in Maryland Coastal Plain streams. 1988 results. Final report, 15:29088 (R;US)

Investor Responsibility Research Center, Washington, DC (USA)
Electric power wheeling and dealing: Technological considerations for increasing competition. Volume 2. Contractor documents, Part C, 15:28199 (R;US)

Ishikawajima-Harima Heavy Industries Co. Ltd., Tokyo (Japan)
Development of molten-carbonate fuel cell, 15:28217 (R;JP)

IT Corp., Knoxville, TN (USA)
Engineering-scale demonstration of thermal desorption technology for manufactured gas plant site soils, 15:27460 (R;US)

J

Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment
Proceedings of the 1989 seminar on nuclear data, 15:29507 (R;JP)

Japan Atomic Energy Research Inst., Tokyo (Japan)
A model of L-H transition, 15:29664 (R;JP)
A study of the uranium enrichment technology of chemical method, 15:27659 (R;JP;In Japanese)
Analysis of effect of variation of gas size in buckled cladding on temperature and heat flux distribution of fuel rod, 15:28004 (R;JP;In Japanese)
Analysis of ICRF heating and current drive in ITER, 15:29802 (R;JP;In Japanese)
Analytical study for PHEBUS experiment 215R by FRAP-T4 calculation code, 15:28058 (R;JP)
Annual report on operation, utilization and technical development of research reactors and hot laboratory: From April 1, 1988 to March 31, 1989, 15:28024 (R;JP;In Japanese)
Basic analysis of pyrometallurgical reprocessing of transuranium fuels, 15:27667 (R;JP;In Japanese)
Characteristic tests of medium-enriched uranium fuel core in JRR-2, 15:28025 (R;JP)
Conceptual design of SPWR, a PWR with enhanced passive safety, 15:28059 (R;JP;In Japanese)
Creep curve formularization by constant stress creep tests, 15:28398 (R;JP;In Japanese)
Current status of uncertainty analysis methods for computer models, 15:29893 (R;JP)
Development of the remote-controlled electrical resistance measurement apparatus, 15:28953 (R;JP;In Japanese)
Dynamics analysis of robot manipulator: Computer simulation for two-linkage mechanism, 15:28702 (R;JP;In Japanese)
Evaluation of effective delayed neutron fraction and prompt neutron lifetime for High Temperature Engineering Test Reactor (HTTR), 15:28026 (R;JP;In Japanese)
Experimental study on the critical heat flux in a varying acceleration field, (2): The measurement of critical heat flux under varying acceleration field, 1, 15:27973 (R;JP;In Japanese)
G(E) functions (spectrum-dose conversion operator) of 3"ϕ spherical NaI(Tl) scintillation detector for estimating effective dose equivalent, 15:28893 (R;JP;In Japanese)
Irradiation effect of transistor by Co-60 gamma rays and electron beams: Effects of exposure rate and temperature, 15:28920 (R;JP;In Japanese)
JAERI contribution to the second NEACRP benchmark calculation on High Conversion Light Water Reactor lattices, 15:27992 (R;JP)
Post irradiation examinations of uranium-plutonium mixed carbide fuels irradiated at medium linear power rate, 15:28003 (R;JP;In Japanese)
Preliminary design of test facilities for tritium breeding blanket development, (1), 15:29803 (R;JP;In Japanese)
Progress report on safety research of high-level waste management for the period April 1988 to March 1989, 15:27759 (R;JP)
SATCAP-B: a program for thermal-hydraulic design of 'Saturated Temperature Capsule', 15:28729 (R;JP;In Japanese)
Sprout inhibition and change in organic components of potato by gamma-irradiation, 15:29166 (R;JP)

Studies on diffusion of ^{137}Cs in cement mortar, 15:27692 (R;JP;In Japanese)
Studies on radiation resistance of fiber reinforced plastic composites featured by easiness of manufacturing, 3: Mechanical properties of high radiation resistant FRP, 15:28536 (R;JP;In Japanese)
Study of marfe phenomena on JT-60, 15:29663 (R;JP)
Task planning systems with natural language interface, 15:28701 (R;JP;In Japanese)
The JMTR operation and technical development, 3: Fiscal 1986 - 1988, 15:28031 (R;JP;In Japanese)
Verification of plant dynamics analysis code for HTTR 'ASURA', 15:28008 (R;JP;In Japanese)
Waterproof effect of plastic coating on radioactive waste solids, 15:27691 (R;JP;In Japanese)

Japan Radio Co. Ltd., Tokyo (Japan)
Sealed-off carbon dioxide laser, 15:28754 (R;JP)

JAYCOR, Torrance, CA (USA). Plasma Technology Div.
Thermal barrier research: Final technical report, September 1985–June 1986, 15:29662 (R;US)

Johns Hopkins Univ., Baltimore, MD (USA)
AGS silicon gold collisions measured in the E-810 TPC [Time Projection Chamber], 15:29538 (R;US)
Numerical and physical modelling of bubbly flow phenomena: Progress report, July 1, 1989–March 31, 1990, 15:28715 (R;US)
V^0 production with 14.5 GeV/c silicon beams, 15:29445 (R;US)

Johns Hopkins Univ., Shady Side, MD (USA). Aquatic Ecology Section
Definitions of critical environmental conditions for selected Chesapeake Bay finfishes exposed to acidic episodes in spawning and nursery habitats. Final report, 15:27948 (R;US)

Johnson (E.R.) Associates, Inc., Oakton, VA (USA)
Acceptance of canisters of consolidated spent nuclear fuel by the Federal Waste Management System, 15:27707 (R;US)
Acceptance of failed SNF [spent nuclear fuel] assemblies by the Federal Waste Management System, 15:27706 (R;US)
Acceptance of non-fuel assembly hardware by the Federal Waste Management System, 15:27708 (R;US)
Supplement to ORNL/Sub/86-SA094/1 on use of transportable storage casks in the nuclear waste management system, 15:27705 (R;US)

Joint Inst. for Nuclear Research, Dubna (USSR)
Investigations of the separation of Np, Pa, U, Th and REE in geological samples, 15:29265 (R;SU)

Underground mining research in the Collie Coalfield, Western Australia, 15:27473 (R;AU)

National Geophysical Data Center, Boulder, CO (USA)
Solar-Geophysical Data Number 542, October 1989. Part 2 (comprehensive reports). Data for April 1989 and miscellaneous, 15:29329 (R;US)

National Inst. for Fusion Science, Nagoya (Japan)
Bootstrap current studies in the Advanced Toroidal Facility, 15:29626 (R;US)

National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)
Hazard and operability study of an ethylene oxide sterilizer for National Institute for Occupational Safety and Health. Final report, 15:29248 (R;US)
Health-hazard evaluation report HETA 89-155-1979, Arcade Parking Garage, Providence, Rhode Island, 15:29006 (R;US)
Health-hazard evaluation report HETA 89-142-1981, Seagull Industries, West Balm Feach, florida, 15:29007 (R;US)
Health-hazard evaluation report HETA 88-156-1984, Georgia Gulf Corporation, Tiptonville, Tennessee, 15:29241 (R;US)
In-depth survey report of Roadway Express, Inc., Toledo, Ohio, 15:29008 (R;US)
NIOSH (National Institute for Occupational Safety and Health) testimony to DOL (Department of Labor) on benzene and leukemia: An epidemiologic risk assessment to the Occupational Safety and Health Administration by J. D. Millar, August 9, 1985, 15:29233 (R;US)
NIOSH (National Institute for Occupational Safety and Health) comments to DOL (Department of Labor) to the Occupational Safety and Health Administration regarding the update of the NIOSH criteria document on beryllium by J. F. Finklea, December 10, 1975, 15:29234 (R;US)
NIOSH (National Institute for Occupational Safety and Health) projects for FY 1989, 15:28132 (R;US)
Proposed national strategies for the prevention of leading work-related diseases and injuries: Occupational lung diseases, 15:27523 (R;US)

National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Field Studies and Clinical Investigations
Asbestos-related disease: A community epidemic in the making, 15:29236 (R;US)
Determination of asbestos levels in a public building located in Towson, Maryland, 15:29009 (R;US)
Spray application of fireproof insulation at the construction site of the Proctor and Gamble Technical Center, Blue Ash, Ohio, 15:29238 (R;US)

National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Physical Sciences and Engineering
Control of asbestos exposure during brake drum service, 15:29014 (R;US)
Control technology for ethylene oxide sterilization in hospitals, 15:29247 (R;US)
NIOSH (National Institute for Occupational Safety and Health) manual of analytical methods (Third edition). Third supplement, 15:29242 (R;US)

National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Surveillance, Hazard Evaluation and Field Studies
Chrysotile asbestos in industry, 15:29240 (R;US)
In depth survey report of Carolina Freight Carriers, Carlisle, Pennsylvania, and York, Pennsylvania, 15:29239 (R;US)

National Inst. for Occupational Safety and Health, Morgantown, WV (USA). Div. of Respiratory Disease Studies
Epidemiology of asbestos-related diseases, 15:29237 (R;US)
National occupational-health survey of mining asbestos report, 15:29243 (R;US)
National occupational-health survey of mining boron minerals report, 15:29244 (R;US)

National Inst. for Petroleum and Energy Research, Bartlesville, OK (USA)
National Institute for Petroleum and Energy Research quarterly technical report, January 1–March 31, 1990: Volume 1, Fuels research, 15:27577 (R;US)

National Inst. of Radiation Protection, Stockholm (Sweden)
How risky is energy production in Sweden and why is it accepted, 15:28134 (R;SE)

National Inst. of Standards and Technology (IMSE), Gaithersburg, MD (USA). Ceramics Div.
Determination of fiber/matrix interfacial properties of ceramic and glass matrix composites. Interim report, 1 January 1986-1 January 1988, 15:28546 (R;US)
Institute for Materials Science and Engineering, Ceramics: Technical activities 1989, 15:28495 (R;US)

National Inst. of Standards and Technology (NEL), Gaithersburg, MD (USA). Building Environment Div.
A proposed methodology for rating integrated air-source heat pumps: Final report, 15:28234 (R;US)

National Inst. of Standards and Technology, Gaithersburg, MD (USA)
Using a new generation of multimeters to measure the quantized resistance, 15:28762 (R;US)

National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)
Proceedings of the symposium on networking, 15:29894 (R;JP)
Proceedings of the workshop on asymmetric B factory at KEK, 15:29447 (R;JP;In Japanese)
Proceedings of the workshop on the experiments by polarized proton and electron beams, 15:29508 (R;JP)
Proceedings of workshop on K-decay experiments, 15:29446 (R;JP;In Japanese)
Tests for cold fusion in electrochemically deuterized palladium, 15:29521 (R;JP)

National Marine Fisheries Service, La Jolla, CA (USA)
California Cooperative Oceanic Fisheries Investigations Reports: Volume 30, January 1 to December 31, 1988, 15:29147 (R;US)

National Ocean Service, Rockville, MD (USA). Office of Oceanography and Marine Assessment
Outer Continental Shelf environmental assessment program. Final reports of principal investigators. Volume 64. Final report, 15:27568 (R;US)

National Oceanic and Atmospheric Administration, Boulder, CO (USA). Environmental Research Labs.
Critical evaluation of the AE indices, 15:29337 (R;US)

National Oceanic and Atmospheric Administration, Las Vegas, NV (USA). Weather Service Nuclear Support Office
A radiation briefer's guide to the PIKE Model, 15:28988 (R;US)

National Research Council, Washington, DC (USA). Committee to Provide Interim Oversight of the DOE Nuclear Weapons Complex
The nuclear weapons complex: Management for health, safety, and the environment, 15:27766 (R;US)

National Technical Information Service, Springfield, VA (USA)
Battery electrodes. January 1975-May 1987 (A Bibliography from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1975-May 1987, 15:28110 (R;US)
Battery electrodes. June 1987-January 1990 (A Bibliography from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for June 1987-January 1990, 15:28111 (R;US)
Carbon dioxide lasers. March 1988-January 1990 (A Bibliography from the NTIS data base). Report for March 1988-January 1990, 15:28758 (R;US)
Carbon dioxide lasers. September 1980-February 1988 (A Bibliography from the NTIS data base). Report for September 1980-February 1988, 15:28757 (R;US)
Extra-high-voltage power transmission. December 1973-December 1989 (A Bibliography from the NTIS database). Report for December 1973-December 1989, 15:28099 (R;US)
Heat exchanger tube vibrations. January 1970-January 1990 (A Bibliography from the COMPENDEX data base). Report for January 1970-January 1990, 15:28724 (R;US)
Ion exchange resins. February 1983-February 1990 (A Bibliography from the NTIS data base). Report for February 1983-February 1990, 15:28547 (R;US)
Magnetic separation of materials. October 1976-November 1989 (A Bibliography from the COMPENDEX data base). Report for October 1976-November 1989, 15:27449 (R;US)
Multiple instruction-multiple data stream (MIMD) computer architecture. January 1977-January 1990 (A Bibliography from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1977-January 1990, 15:29905 (R;US)
Optical coatings. November 1983-December 1989 (A Bibliography from the NTIS dat abase). Report for November 1983-December 1989, 15:27852 (R;US)
Ozone in the stratosphere. May 1982-January 1990 (A Bibliography from the NTIS data base). Report for May 1982-January 1990, 15:29016 (R;US)
Planetary volcanology. November 1972-January 1990 (A Bibliography from the International Aerospace Abstracts data base). Report for November 1972-January 1990, 15:29330 (R;US)
Pulse techniques for laser applications. January 1970-April 1987 (A Bibliography from the Searchable Physics Information Notices data base). Report for January 1970-April 1987, 15:28755 (R;US)
Pulse techniques for laser applications. May 1987-January 1990 (A Bibliography from the Searchable Physics Information Notices data base). Report for May 1987-January 1990, 15:28756 (R;US)
Radioactive waste processing: Borosilicate glasses and synthetic rocks. June 1977-February 1990 (A Bibliography from the NTIS data base). Report for June 1977-February 1990, 15:27710 (R;US)
Radioactive waste processing: Fixation in cements and bitumens. November 1973-February 1990 (A Bibliography from the NTIS data base). Report for November 1973-February 1990, 15:27709 (R;US)
Radioactive waste processing: Vitrification. November 1973-October 1989 (A Bibliography from the NTIS data base). Report for November 1973-October 1989, 15:27711 (R;US)
Rust inhibiting coatings. January 1980-November 1989 (A Bibliography from World Surface Coatings Abstracts). Report for January 1980-November 1989, 15:28367 (R;US)
Stress corrosion of stainless steel. January 1976-June 1987 (A Bibliography from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1976-June 1987, 15:28409 (R;US)
Stress corrosion of stainless steel. July 1987-January 1990 (A Bibliography from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for July 1987-January 1990, 15:28410 (R;US)
Sunspots: Solar-terrestrial interactions. September 1972-January 1990 (A Bibliography from the International Aerospace Abstracts data base). Report for September 1972-January 1990, 15:29331 (R;US)

Tungsten and tungsten alloy powder metallurgy. January 1970-February 1990 (A Bibliography from the NTIS data base). Report for January 1970-February 1990, 15:28408 (R;US)

Urea/phenol/melamine formaldehyde polymeric resins. January 1970-February 1990 (A Bibliography from the NTIS data base). Report for January 1970-February 1990, 15:29249 (R;US)

Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland)

Conservation of organic materials over several thousand years, 15:28545 (R;CH;In German)

Exploratory boreholes Boettstein, Weiach, Riniken, Schafisheim, Kaisten, Leuggern: fluid-logging. Temperature, salinometer and spinner-flowmeter measurements: Annex volume, 15:29271 (R;CH;In German)

Exploratory boreholes Boettstein, Weiach, Riniken, Schafisheim, Kaisten, Leuggern: fluid-logging. Temperature, salinometer and spinner-flowmeter measurements: Text volume, 15:29272 (R;CH;In German)

Geoscientific bases of the exploratory site Oberbauen Stock: Volume 1, 15:27698 (R;CH;In German)

Geoscientific bases of the exploratory site Oberbauen Stock: Volume 2: annexes, 15:29270 (R;CH;In German)

Grimsel test site: radar crosshole tomography with application to migration of saline tracer through fracture zones, 15:29274 (R;CH)

Inverse modeling of Chalk River block.: HYDROCOIN - level 2/case 3, level 3/case 5a, 15:29273 (R;CH)

Stripa project annual report 1988, 15:29047 (R;CH)

Stripa Project: interim report on the rock sealing project (stage 1), 15:29275 (R;CH)

The corrosion behaviour of carbon steel in Portland cement, 15:28405 (R;CH)

Naval Ocean Systems Center, San Diego, CA (USA)

Measuring the effectiveness of nonpoint-source control techniques for aquatic protection. Final summary report, 15:29063 (R;US)

Naval Research Lab., Washington, DC (USA)

Critical-current density and transition-temperature measurements of Y-Ba-Cu-O rods. Memorandum report, 15:28460 (R;US)

Flash-lamp-pumped Ti:Al_2O_3 laser using fluorescent conversion, 15:28746 (R;US)

Three-dimensional cloud dynamics: Preliminary application to a HANE (High Altitude Nuclear Explosions) environment. Interim report, 15:29336 (R;US)

Nebraska Univ., Lincoln, NE (USA). Dept. of Physics and Astronomy

Recent advances in track physics, 15:28892 (B;US)

New Brunswick Energy Secretariat, Fredericton, NB (Canada)

Harvesting budworm-damaged stands for fuel: Final report, 15:27796 (R;CA)

Passive solar addition: Final report, 15:28250 (R;CA)

New Brunswick Univ., Fredericton, NB (Canada). Faculty of Forestry

Small scale wood chip fuel harvesting and processing, 15:27797 (R;CA)

New Mexico Inst. of Mining and Technology, Socorro, NM (USA)

Quality assessment of strippable coals in New Mexico, Year 3, Phase 2. Menefee, Crevasse Canyon, and Moreno Hill Formation coals in the San Juan Basin and salt lake coal field. Report for 30 September 1987-30 November 1988, 15:27468 (R;US)

New Mexico Univ., Albuquerque, NM (USA). Dept. of Electrical and Computer Engineering

Increased stuck-at fault coverage with reduced I_{DDQ} test sets, 15:28550 (R;US)

Newcastle upon Tyne Univ. (UK). Computing Lab.

Concurrent constructive logic. Technical report series, 15:29904 (R;GB)

Niagara Technical Consultants, Niagara Falls, NY (USA)

Reduction of critical path time for BWR recirculation system decontaminations: Final report, 15:28056 (R;US)

Niels Bohr Inst., Copenhagen (Denmark)

Electroweak magnetism: Theory and applications, 15:29470 (R;DK)

The O(N)-symmetric non-linear σ-model to three leading orders in 1/N, 15:29493 (R;DK)

Nordisk Kontaktorgan for Atomenergispoergsmaal, Risoe (Denmark)

Plan for Nordic nuclear safety program 1990-1993, 15:27771 (R;DK;In Swedish, Norwegian, Danish)

North Carolina Univ., Chapel Hill, NC (USA). Dept. of Physics and Astronomy

Materials processing of diamond: Etching, doping by ion implantation, and contact formation. Annual technical report, 1 October 1988-30 September 1989, 15:28524 (R;US)

Northeastern Univ., Boston, MA (USA)

Active probing of space plasmas. Final report, 25 October 1985-30 September 1989, 15:29338 (R;US)

Notre Dame Univ., IN (USA)

Metalloboranes as precursors to metallic glasses. Final report, 1 July 1986-30 September 1989, 15:28370 (R;US)

NOVETECH Corp., Rockville, MD (USA)

Evaluation of upper-shelf toughness requirements for reactor pressure vessels: Final report, 15:27978 (R;US)

Nuclear Energy Agency, 75 - Paris (France)

NEA Activities in 1988, 15:29850 (R;XN)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering

Correlation of irradiation-induced transition temperature increases from C_v and K_{Jc}/K_{Ic} data: Final report, 15:28002 (R;US)

Effects of manufacturing variables on performance of high-level waste low carbon steel containers: Final report, 15:27699 (R;US)

Effects of mineralogy on sorption of strontium and cesium onto Calico Hills Tuff, 15:27701 (R;US)

Influence of fluence rate on radiation-induced mechanical property changes in reactor pressure vessel steels: Final report on exploratory experiments, 15:28001 (R;US)

Qualification process for ultrasonic testing in nuclear inservice inspection applications, 15:28068 (R;US)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of Freedom of Information and Publications Services

Nuclear Regulatory Commission issuances, December 1989: Volume 30, No. 6, 15:27984 (R;US)

Nuclear Regulatory Commission issuances: Volume 31, No. 1, 15:27985 (R;US)

Regulatory and technical reports (Abstract Index Journal): Annual compilation for 1989: Volume 14, No. 4, 15:27980 (R;US)

Title list of documents made publicly available, December 1–31, 1989: Volume 2, No. 12, 15:27983 (R;US)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of High-Level Waste Management

A review of techniques for propagating data and parameter uncertainties in high-level radioactive waste repository performance assessment models, 15:27700 (R;US)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of Low-Level Waste Management

IMPACTS-BRC, Version 2.0: Program users's manual, 15:27702 (R;US)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of Low-Level Waste Management and Decommissioning

Application of surface complexation models for radionuclide adsorption: Sensitivity analysis of model input parameters, 15:27703 (R;US)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of Regulatory Applications

Maintenance approaches and practices in selected foreign nuclear power programs and other US industries: Review and lessons learned: Final report, 15:28067 (R;US)

Performance testing of extremity dosimeters, Study 2, 15:28911 (R;US)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of Safety Issue Resolution

Proceedings of the public workshop on nuclear power plant license renewal, 15:27986 (R;US)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of Systems Research

Basic considerations in predicting error probabilities in human task performance, 15:28069 (R;US)

MELCOR Accident Consequence Code System (MACCS): Volume 1, User's guide, 15:28015 (R;US)

Nuclear Regulatory Commission, Washington, DC (USA). Mechanical Engineering Branch
On the investigation of cracking in safety injection PWR lines due to thermal stratification, 15:27962 (R;US)
Nuclear Regulatory Commission, Washington, DC (USA). Office for Analysis and Evaluation of Operational Data
Licensee event report (LER) compilation: For month of February 1990, 15:27987 (R;US)
Report to Congress on abnormal occurrences, October–December 1989, 15:27979 (R;US)

Environment, safety, health and waste management plan: Revision 2, 15:27769 (R;US)
Flexible membrane liner acceptance testing case studies, 15:27658 (R;US)

Westinghouse Savannah River Co., Aiken, SC (USA)
A planning process for an improved environment at the Savannah River Site, 15:28143 (R;US)
Accident analysis, nitrogen supply and purge systems: In-Tank Precipitation process, Savannah River Site, 15:27746 (R;US)
Analytical support for a new, low-level radioactive wastewater treatment plant, 15:27747 (R;US)
Evaluation of closure capping on groundwater flow and solute transport at the General Separations Area: Flow model and particle-tracking analysis of closure caps with runoff, 15:27745 (R;US)
Modeling of combustion processes in a solid fuel particle, 15:27670 (R;US)
Monte Carlo analysis of the variation between axial power distribution and detector response, 15:28032 (R;US)
Parallel channel flow excursions, 15:28727 (R;US)
Production reactor characteristics, 15:28033 (R;US)
Reactor operation environmental information document: Volume 3, Meteorology, surface hydrology, transport and impacts, 15:28020 (R;US)

Woodward-Clyde Consultants, Pasadena, CA (USA)
Deterministic modeling of regional wave forms from the Nevada Test Site. Final report, 5 September 1988-5 March 1989, 15:28971 (R;US)

Wyle Labs., Huntsville, AL (USA)
Guide to optimized replacement of equipment seals: Final report, 15:27967 (R;US)

X

Xerox Palo Alto Research Center, CA (USA)
Pulsed-laser deposition of high-t_c superconducting thin films. Final technical report, 15 November 1988-15 October 1989, 15:28458 (R;US)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.

Subject Index

This index is arranged by subject descriptors selected from those assigned to each citation in this publication. Subject descriptors are selected from a controlled thesaurus of terms, *EDB Subject Thesaurus* (DOE/OSTI-7000). In order to enhance indexing, subject descriptor entries generally consist of a pair of descriptors: a main term and a qualifier term. Each entry includes the full title (which may be followed by supplementary descriptive information in parentheses) and the citation number. Additional information given in parentheses indicates the document type (an abbreviation such as B for book), the country of publication (such as DE for Federal Republic of Germany), and the language if non-English.

See references guide users from synonymous terms to the descriptors selected for the concept. *See also* references indicate subject concepts that are more specific than a particular descriptor. To gain complete subject coverage, all such terms should be reviewed.

AIR POLLUTION
See also INDOOR AIR POLLUTION

Abscisic Acid
Analysis of phytohormones and secondary plant products (main flavonoids and terpenes) in healthy and damaged needles from the natural location, 15:29228 (RA;DE;In German)

Biochemistry
Biochemical changes in the metabolism of affected beech trees (Fagus sylvatica L.) - secondary plant metabolites (phytoalexins) related to the pathogenic situation, 15:29215 (RA;DE;In German)

Biological Effects
Effects of air pollutants and other stress factors on phytohormone concentrations in trees, 15:29227 (RA;DE;In German)
Effects of environmental pollutants on photosynthesis and cell membranes of plants, 15:29211 (RA;DE;In German)
Experience and findings of experiments in the GSF exposure chambers, 15:29222 (RA;DE;In German)

Biological Indicators
Sulfate and nitrate concentrations in needles and leaves as indicators of SO_2 or NO_2 pollution, 15:29210 (RA;DE;In German)

Chemical Analysis
European source region identification of long range transported aerosol, 15:28605 (RA;SE)

Environmental Effects
Assessment of episodic acidification in the Sierra Nevada, California. Final report, 1987-1989, 15:29081 (R;US)

Environmental Impacts
A survey of radial growth trends in spruce in the Great Smoky Mountains National Park as influenced by topography, age, and stand development, 15:29181 (R;US)

Foliar Uptake
Quantitative studies on pollutant uptake by leaves: Cuticular permeability with particular regard to lateral heterogeneity of leaf surfaces, 15:29219 (RA;DE;In German)
Sorption and permeation properties of plant cuticles for gaseous pollutants and water after exposure to gaseous pollutants, 15:29217 (RA;DE;In German)

Gibberellic Acid
Effects of air pollutants and other stress factors on phytohormone concentrations in trees, 15:29227 (RA;DE;In German)

Metabolism
Biochemical changes in the metabolism of affected beech trees (Fagus sylvatica L.) - secondary plant metabolites (phytoalexins) related to the pathogenic situation, 15:29215 (RA;DE;In German)

Nitrogen Oxides
Report on 1989 joint symposium on stationary combustion NO_x control, 15:29024 (R;SE;In Swedish)
Nuclear Reaction Analysis
European source region identification of long range transported ambient aerosol based on PIXE analysis and related techniques, 15:28602 (R;SE)
Organic Compounds
Studies on the concentrations and enrichment of potentially phytotoxic organic pollutants in rain, cloud, and fogwater, 15:28993 (RA;DE;In German)
Photochemical Oxidants
Peroxide detoxification of spruce needles in forest sites of the Northern Alps (Wank), 15:29226 (RA;DE;In German)
Photosynthesis
Gas exchange measurements as a method for early detection of tree damage in mountain forest sites, 15:29224 (RA;DE;In German)
The contribution of photoinhibition to the effects of airborne pollutants on the photosynthesis apparatus, 15:29212 (RA;DE;In German)
The influence of peroxides on photosynthesis in spruce (Picea abies), 15:29214 (RA;DE;In German)
Stomata
Laboratory comparison of the stomatal opening behaviour of alpine fir trees and ozone-burdened trees, 15:29225 (RA;DE;In German)
Sorption and permeation characteristics of cuticles for monoterpenes, with particular regard to the effects of gaseous pollutants on spruce trees, 15:29216 (RA;DE;In German)

AIR POLLUTION ABATEMENT
Methods of simultaneous reduction of SO_2 and NO_x, 15:29022 (R;SE;In Swedish)

AIR POLLUTION CONTROL
Advanced technologies for reduced CO2 emissions, 15:29032 (B;US)
Reduction of nitrogen oxides in engine exhaust gases by the addition of cyanuric acid, 15:28355 (J;US)

AIR POLLUTION MONITORING
Ambient monitoring guidelines for Prevention of Significant Deterioration (PSD), 15:29013 (R;US)
Examination of the relationship between Navajo generating station emissions and aerosol concentrations at Page, Arizona, 15:29034 (B;US)
Studies on ozone concentrations in air along two altitudinal transects in the Bavarian Alps and at a research tower in the Bavarian Forest National Park, 15:28994 (RA;DE;In German)
The design and calibration of a fine fraction aerosol mass monitor based on beta attenuation, 15:28604 (RA;SE)
The trade off between the complexity, imput data and scale of application of the RAINS-Lake model: A statistical analysis, 15:29033 (B;US)

AIR POLLUTION MONITORS
A new PIXE set up dedicated to the analysis of aerosol samples, 15:28603 (RA;SE)

AIR QUALITY
Economic impact of air-pollutant emission standards for new municipal-waste combustors. Final report, 15:28327 (R;US)
Overview of indoor air quality sampling and analysis, 15:28276 (BA;US)
Regulatory standards applicable or relevant to the independent Hanford environmental surveillance and oversight program, 15:28133 (R;US)

Adhesion in solids, 15:28556 (B;US)
B and W-2 - Evaluation of the fabricability of advanced austenitic tubing, 15:27915 (RA;US)
CU-2 - Mechanical properties and microstructural stability of advanced austenitic alloys, 15:27917 (RA;US)
FW-2 - Fireside corrosion testing of candidate superheater tube alloys, coating, and cladding, 15:27943 (RA;US)
ORNL-2(B) - Development and evaluation of advanced austenitic alloys, 15:27918 (RA;US)
ORNL-3(B) - Effects of a reactive element on the impact response of oxide scales, 15:27929 (RA;US)
OSU-2 - Fundamental study of aluminizing and chromizing processes, 15:27920 (RA;US)
UTN-2 - Investigation of welding and joining techniques for advanced austenitic alloys, 15:27921 (RA;US)
WHC-2 - Investigation of electro-spark deposited coatings for protection of materials in sulfidizing atmospheres, 15:27922 (RA;US)

ALLUVIAL DEPOSITS
Cooperative LLNL/HAZWRAP project to demonstrate determination of field-based retardation factors: Part 3: Algorithm to determine a field-based retardation factor, 15:29104 (R;US)
Cooperative LLNL/HAZWRAP project to demonstrate determination of field-based retardation factors: Part 2, Determination of sorption constants, 15:29105 (R;US)

ALPHA DECAY
Energy separation of the doublet of intrinsic states at the ground state of ^{229}Th, 15:29567 (J;US)

ALPHA PARTICLE MODEL
See CLUSTER MODEL

ALPHA PARTICLES
Scintillation detector for escaping alphas and tritons in TFTR, 15:29759 (BA;US)
The influence of non-uniform α-irradiation of Chinese hamster liver on chromosome damage and the induction of cancer, 15:29189 (BA;GB)

ALPHA-BEARING WASTES
Defense waste tank storage at the Hanford Site, 15:27742 (R;US)
Evaluation of technologies for remediation of disposed radioactive and hazardous wastes in a facility at the Idaho National Engineering Laboratory, 15:27683 (R;US)
Investigation of an empirical creep law for rock salt that uses reduced elastic moduli, 15:27730 (R;US)

ALPS
The research concept for investigations of forests of the Northern Alps, 15:28992 (RA;DE;In German)

ALUMINIA
See ALUMINIUM OXIDES

ALUMINIUM
Atomistic simulations of interface in metals and alloys, 15:28432 (BA;US)
Definitions of critical environmental conditions for selected Chesapeake Bay finfishes exposed to acidic episodes in spawning and nursery habitats. Final report, 15:27948 (R;US)
Effects of acid rain and liming on a spruce site (Hoeglwald project), 15:29207 (RA;DE;In German)
Electronic structure of extended defects in close-packed metals, 15:28440 (BA;US)
Microstructure and wear characterization of self-lubricating Al_2O_3 - MoS_2 composite ceramic coatings, 15:28505 (BA;US)
Molecular dynamics simulation of a $\Sigma = 5$ aluminum bicrystal, 15:28424 (BA;US)

ALUMINIUM 27 TARGET
[Reaction mechanism studies of heavy ion induced nuclear reactions]: Annual progress report, 15:29533 (R;US)

ALUMINIUM ALLOYS
See also ALUMINIUM BASE ALLOYS
Atomistic simulations of interface in metals and alloys, 15:28432 (BA;US)
CSM-2 - Investigation of the weldability of polycrystalline iron aluminides, 15:27916 (RA;US)
Characterization and statistical distribution of grain boundaries in Ni_3Al, 15:28443 (BA;US)
Effect of fluid flow on corrosion fatigue initiation of aluminum alloy 2017-T4, 15:28452 (J;US)
Fuel cladding corrosion studies for the advanced neutron source, 15:28022 (R;US)
Grain boundary characterization in Ni_3Al, 15:28444 (BA;US)
Grain boundary softening in boron-doped Ni_3Al, 15:28436 (BA;US)

Interaction of slip with grain boundary in the Li_2 ordered structure - A Σ = 9 tilt boundary, 15:28434 (BA;US)
Materials for cold neutron sources: Cryogenic and irradiation effects, 15:27786 (R;US)
Microstructure and mechanical properties of Ni_3Al–Al_2O_3 composites produced by hot extrusion, 15:28532 (R;US)
Microstructure and mechanical properties of nickel aluminide powders consolidated by extrusion and hot isostatic pressing, 15:28395 (R;US)
ORAU-3 - Study of the incubation stage of erosion of 1,100 aluminum, 15:27928 (RA;US)
Theoretical studies of grain boundaries in Ni, Al, and Ni_3Al with and without boron, 15:28435 (BA;US)
UTN-3 - Aqueous corrosion of iron aluminides, 15:27935 (RA;US)

ALUMINIUM BASE ALLOYS
BCL-3 - Investigation of the effects of microalloying constituents and oxidation conditions on the development and breakdown of protective oxide layers, 15:27924 (RA;US)
UCIN-3(A) - High temperature corrosion of aluminides, 15:27932 (RA;US)

ALUMINIUM COMPOUNDS
See also ALUMINIUM NITRIDES
ALUMINIUM OXIDES
Neutron diffraction and transmission electron microscopy study of hydrogen-induced phase transformations in Zr_3Al, 15:28449 (J;US)
ORNL-2(F) - Development of iron aluminides, 15:27919 (RA;US)

ALUMINIUM NITRIDES
Oxidation of metastable single-phase polycrystalline $Ti_{0.5}Al_{0.5}N$ films: Kinetics and mechanisms, 15:28519 (J;US)

ALUMINIUM OXIDES
Application of controlled pore structures to kinetic studies in alumina, 15:28506 (BA;US)
Application of surface complexation models for radionuclide adsorption: Sensitivity analysis of model input parameters, 15:27703 (R;US)
Microstructure and mechanical properties of Ni_3Al–Al_2O_3 composites produced by hot extrusion, 15:28532 (R;US)
Microstructure and wear characterization of self-lubricating Al_2O_3 - MoS_2 composite ceramic coatings, 15:28505 (BA;US)
Modeling ore reduction in thermal plasmas, 15:28500 (BA;US)
Thermodynamic analysis of chemical stability of ceramic materials in hydrogen-containing atmospheres at high temperatures. Final report, 15:28493 (R;US)

ALUMINUM
See ALUMINIUM

ALVEOLI (PULMONARY)
See LUNGS

AMBIENT TEMPERATURE
GCM [general circulation model] predictions for surface air temperature and precipitation over the southeastern United States, 15:29028 (R;US)
Global and hemispheric annual temperature variations between 1861 and 1988, 15:28997 (R;US)

AMERICIUM
Basic analysis of pyrometallurgical reprocessing of transuranium fuels, 15:27667 (R;JP;In Japanese)

AMIDES
[Experimental and computation studies of polar solvation]: Progress report, 15:28645 (R;US)

AMINES
See also MELAMINE
POLYCYCLIC AROMATIC AMINES
TETRYL
Industrial-hygiene assessment of coal-liquefaction plants, 15:27521 (R;US)

AMINO ACIDS

See WELL CASINGS
CASTOR TOKAMAK
Electron cyclotron emission and absorption experiment on the CASTOR tokamak, 15:29633 (R;CS)
CATALYST SUPPORTS
A spectroscopic and catalytic investigation of active phase-support interactions, 15:28480 (RA;US)
Enhancement of activity and selectivity by metal-support interactions, 15:28636 (RA;US)
CATALYSTS
A spectroscopic and catalytic investigation of active phase-support interactions, 15:28480 (RA;US)
Selectivity of the reactions of oxygenates on transition metal surfaces, 15:28375 (RA;US)
Adsorption
Support effects studied on model supported catalysts, 15:28478 (RA;US)
Bonding
Metal-support bonds in supported metal catalysts, 15:28475 (RA;US)
Molecular surface science and its application to heterogeneous catalysis and coatings, 15:28634 (RA;US)
Chemical Activation
Vibrational spectroscopic studies of surface chemical interactions in chemisorption and catalysis, 15:28641 (RA;US)

Chemical Composition
Model catalytic oxidation studies using supported monometallic and heterobimetallic oxides, 15:28474 (RA;US)
X-ray absorption spectroscopic studies of catalystic materials, 15:28613 (BA;US)

Chemical Preparation
Metal-support bonds in supported metal catalysts, 15:28475 (RA;US)
Morphological aspects of surface reactions, 15:28639 (RA;US)
The effect of catalyst preparation on catalytic activity, 15:28632 (RA;US)

Chemical Reactions
Activation and decomposition of alkanes on group VIII transition metal surfaces: dynamics, kinetics and spectroscopy, 15:28637 (RA;US)
Chemical interactions in multimetal/zeolite catalysts, 15:28630 (RA;US)
High pressure heterogeneous catalysis in a low pressure, ultra-high vacuum environment, 15:28618 (RA;US)
Model heteroatom removal reactions on molybdenum, 15:28378 (RA;US)
The formation of supported bimetallic clusters: The effect of support - Metal precursor interactions, 15:28477 (RA;US)

Chemisorption
Theoretical studies of chemisorption and surface reactions on nickel and silicon, 15:28640 (RA;US)

Deactivation
Carbon deposition and deactivation of metallic catalysts, 15:28373 (RA;US)

Deposition
Model catalytic oxidation studies using supported monometallic and heterobimetallic oxides: Progress report, August 1, 1989–July 31, 1990, 15:28485 (R;US)

Design
Catalysts for synthetic liquid fuels, 15:27427 (R;AU)

Electronic Structure
Effects of dispersion and support on adsorption, catalytic and electronic properties of cobalt/alumina CO hydrogenation catalysts, 15:28376 (RA;US)
Enhancement of activity and selectivity by metal-support interactions, 15:28636 (RA;US)
Structural and electronic properties of iron and cobalt molecular sieve catalysts, 15:28635 (RA;US)

Infrared Spectra
Infrared study of carbon deposits on bimetallic catalysts, 15:28473 (RA;US)

Microstructure
Metal-support bonds in supported metal catalysts, 15:28475 (RA;US)

Molecular Structure
Investigation of the structure and reactions of catalysts and inorganic constituents in coal liquefaction, 15:27399 (RA;US)
Molecular structure and chemical reactivity on surfaces, 15:28383 (RA;US)

Nuclear Magnetic Resonance
Nuclear magnetic resonance in solids, 15:28633 (RA;US)

Oxides
Model catalytic oxidation studies using supported monometallic and heterobimetallic oxides, 15:28474 (RA;US)

Physical Properties
Kinetic and spectroscopic characterization of metal oxide and sulfide catalysts, 15:28631 (RA;US)

Reaction Kinetics
Kinetic and spectroscopic characterization of metal oxide and sulfide catalysts, 15:28631 (RA;US)
Surface analyses and modeling of rate multiplicity and instabilities, 15:28380 (RA;US)

Reactivity
Chemistry of bimetallic and alloy surfaces, 15:28385 (RA;US)
Molecular structure and chemical reactivity on surfaces, 15:28383 (RA;US)
Reactive characterization as a probe of the nature of catalytic sites, 15:28471 (RA;US)
Some fundamental aspects of zeolite catalysis, 15:28479 (RA;US)
Support effects studied on model supported catalysts, 15:28478 (RA;US)

Structural Chemical Analysis
Investigation of the structure and reactions of catalysts and inorganic constituents in coal liquefaction, 15:27399 (RA;US)
Morphological aspects of surface reactions, 15:28639 (RA;US)

Structure-Activity Relationships
Correlations between surface structure and catalytic activity/selectivity, 15:28379 (RA;US)
Enhancement of activity and selectivity by metal-support interactions, 15:28636 (RA;US)
Fundamental investigations of supported metal catalysts, 15:28621 (RA;US)
Heterogeneous catalysis related to energy systems, 15:28384 (RA;US)
Model Cu/ZnO catalysts for methanol synthesis: The role of surface structure, 15:28472 (RA;US)
Some fundamental aspects of zeolite catalysis, 15:28479 (RA;US)
Structural and electronic properties of iron and cobalt molecular sieve catalysts, 15:28635 (RA;US)
Structure and reactivity of model thin film catalysts, 15:28625 (RA;US)
Studies of supported hydrodesulfurization catalysts, 15:28483 (RA;US)
The dynamics of non-dissociative and dissociative adsorption on Pt(111), 15:28626 (RA;US)

Surface Coating
Infrared study of carbon deposits on bimetallic catalysts, 15:28473 (RA;US)

Surface Properties
Acid/base and redox reactions over oxide catalysts, 15:28619 (RA;US)
Activation and decomposition of alkanes on group VIII transition metal surfaces: dynamics, kinetics and spectroscopy, 15:28637 (RA;US)
Catalytic hydrogenation of carbon monoxide, 15:28616 (RA;US)
Chemical interactions in multimetal/zeolite catalysts, 15:28630 (RA;US)
Chemistry of bimetallic and alloy surfaces, 15:28385 (RA;US)
Correlations between surface structure and catalytic activity/selectivity, 15:28379 (RA;US)
Effects of dispersion and support on adsorption, catalytic and electronic properties of cobalt/alumina CO hydrogenation catalysts, 15:28376 (RA;US)
Interaction of carbon and sulfur on metal catalysts, 15:28627 (RA;US)
Model catalyst studies of active sites and metal/support interactions on vanadia and vanadia-supported catalysts, 15:28482 (RA;US)
Model heteroatom removal reactions on molybdenum, 15:28378 (RA;US)
Molecular surface science and its application to heterogeneous catalysis and coatings, 15:28634 (RA;US)
Morphological aspects of surface reactions, 15:28639 (RA;US)
Nuclear magnetic resonance in solids, 15:28633 (RA;US)
Project summary, 15:28476 (RA;US)
Reactive characterization as a probe of the nature of catalytic sites, 15:28471 (RA;US)
Solid state, surface and catalytic studies of oxides, 15:28622 (RA;US)
Surface analyses and modeling of rate multiplicity and instabilities, 15:28380 (RA;US)
The dynamics of non-dissociative and dissociative adsorption on Pt(111), 15:28626 (RA;US)
The formation of supported bimetallic clusters: The effect of support - Metal precursor interactions, 15:28477 (RA;US)
Theoretical studies of chemisorption and surface reactions on nickel and silicon, 15:28640 (RA;US)
Vibrational spectroscopic studies of surface chemical interactions in chemisorption and catalysis, 15:28641 (RA;US)

Surface Treatments
Effects of presulfidization on the selectivity and surface structure of ruthenium catalysts, 15:28451 (J;US)

Synthesis
Catalytic steam gasification of carbon: Research on tungsten carbide catalysts with high surface area, 15:28470 (RA;US)
Systematic preparation of selective heterogeneous catalysts, 15:28469 (RA;US)

CATALYTIC CONVERTERS
Evaluation of resistively heated metal monolith catalytic converters on an M100 neat methanol-fueled vehicle. Part 2. Technical report, 15:28354 (R;US)

CATION EXCHANGE CAPACITY
See CATIONS
ION EXCHANGE

CATIONS
Simulation and analysis of the loss of inorganic ions from leaves under exposure to acid rain and airborne pollutants, 15:29218 (RA;DE;In German)

CAUSTIC FLOODING
New variations of chemical EOR and their economic potential: The ASP process (Alkaline - Surfactant - Polymer), 15:27554 (RA;US)

CAVITIES

Central nervous system tumours and related intracranial pathologies in radium dial workers, 15:29185 (BA;GB)

CEPHEIDS
Update on the OPAL opacity code, 15:29333 (R;US)

CERAMICS

Chemical Composition
The efficiencies and error-rates of Euclidean and Mahalanobis searches in hypergeometries of archaeological ceramic compositions, 15:28464 (R;US)

Chemical Preparation
Topotactic and epitactic routes to new materials: Progress report, 15:28486 (R;US)

Design
CERAMATEC-1 - Design, fabrication, and interface characterization of ceramic fiber-ceramic matrix composites, 15:27901 (RA;US)

Fabrication
CERAMATEC-1 - Design, fabrication, and interface characterization of ceramic fiber-ceramic matrix composites, 15:27901 (RA;US)
GT-1 - Development of advanced fiber-reinforced ceramics, 15:27903 (RA;US)
GT-1(A) - Modeling of fibrous preforms for CVD infiltration, 15:27902 (RA;US)
INEL-1(B) - Joining of silicon carbide-reinforced ceramics, 15:27905 (RA;US)
NIST-1 - Structural reliability and damage tolerance of ceramic composites for high-temperature applications, 15:27908 (RA;US)

Grain Boundaries
Interfacial structure, properties and design, 15:28498 (B;US)

Materials Testing
NIST-1 - Structural reliability and damage tolerance of ceramic composites for high-temperature applications, 15:27908 (RA;US)

Mechanical Properties
Application of electron microscopy for the analysis of the mechanical behavior of advanced ceramics, 15:28497 (B;US)

Nondestructive Testing
An examination of selected NDE methods for ceramic composite tubes, 15:28730 (R;US)

Permeability
GT-1(A) - Modeling of fibrous preforms for CVD infiltration, 15:27902 (RA;US)

Piezoelectricity
Use of piezoelectric ceramics in detection and measurement of pulsed laser radiation, 15:28615 (J;US)

Research Programs
Colloid and interface chemistry aspects of ceramics. Final technical report, 1 August 1985-31 August 1989, 15:28461 (R;US)
Institute for Materials Science and Engineering, Ceramics: Technical activities 1989, 15:28495 (R;US)

Sintering
Microwave sintering of waste loaded ceramic masses, 15:27655 (R;DE;In German)
ORNL-1(D) - Microwave sintering of ceramics, 15:27913 (RA;US)

Strength Functions
Comparison between data generated from "standard" fracture toughness specimens and from nonstandard specimens made of a silicon carbide, 15:28488 (R;US)

Surface Properties
Surface studies of ceramics using microbeam methods, 15:28481 (RA;US)

Synthesis
Ceramics derived from organo-metallic precursors and microstructure of amorphous polymer. Final report, 15:28459 (R;US)

CERIUM 139
The research group: Standards of radioactivity, 15:28875 (RA;ZA)

CERIUM BORIDES
Specific heat in a magnetic field: A probe of the magnetic ground-state properties of heavy-fermion $Ce(Ru_{2-x}Rh_x)Si_{2-y}Ge_y$, 15:28515 (J;US)

CERIUM SILICIDES
Specific heat in a magnetic field: A probe of the magnetic ground-state properties of heavy-fermion $Ce(Ru_{2-x}Rh_x)Si_{2-y}Ge_y$, 15:28515 (J;US)

Claystones of the Newcastle coal measures, 15:27474 (R;AU)

CLEAN ROOMS
Clean room designs: State of the art today and directions in the 1990s, 15:28708 (R;US)

CLEAN WATER ACT
The NPDES program in West Virginia: Getting back to the basics, 15:28145 (BA;US)

CLIMATES
A survey of radial growth trends in spruce in the Great Smoky Mountains National Park as influenced by topography, age, and stand development, 15:29181 (R;US)
Climate change in the Pacific Northwest and its impact on energy planning: Preliminary report on findings: Final report, 15:29066 (R;US)
Climate change in the Pacific Northwest and its impact on energy planning: Preliminary report of findings: Appendix, Severe climate in the Pacific Northwest: Final, 15:28117 (R;US)
Institutional directory: Climate-related impacts network, 15:29000 (R;US)
Review of future plans of the MAP3S Precipitation Chemistry Network: Derived from a MAP3S workshop held April 18–20, 1989, Bethesda, Maryland, 15:28982 (R;US)
The effects of climate change on energy planning and operations in the Pacific Northwest: Volume 2, Technical background: Final report, 15:28190 (R;US)

CLINOPTILOLITE
Effects of mineralogy on sorption of strontium and cesium onto Calico Hills Tuff, 15:27701 (R;US)

CLOUDS
Review of future plans of the MAP3S Precipitation Chemistry Network: Derived from a MAP3S workshop held April 18–20, 1989, Bethesda, Maryland, 15:28982 (R;US)

CLOVER
Recirculation of process water in two-stage digestion, 15:27819 (RA;SE;In Swedish)

CLUSTER MODEL
Equation for the NNN-πNNN system and its application to pd → ^{3}Heπ^0 ($t\pi^+$) reaction, 15:29524 (RA;JP;In Japanese)
CO-GENERATION
See COGENERATION
CO2 FLOODING
See CARBON DIOXIDE INJECTION
COAL
See also BROWN COAL
Bioconversion
Development of a novel approach for coal bioconversion to alcohol fuels, 15:27425 (R;US)
Solubilization of coal by biocatalysts in organic solvents, 15:27403 (RA;US)
Biodegradation
Bioprocessing of coal and model compounds, 15:27404 (RA;US)
Catalytic Cracking
Kinetics of coal hydrogenation and cracking with Lewis acids using in-situ ESR [Electron Spin Resonance] spectroscopy, 15:27406 (RA;US)
Chemical Analysis
The DOE [Department of Energy] coal sample bank - Monitoring of coal deterioration, 15:27402 (RA;US)
Chemical Bonds
Chemistry of large molecules, 15:27438 (RA;US)
Chemical Composition
A solid-state NMR study of condensation/retrograde reactions during coal liquefaction, 15:27405 (RA;US)
Chemical Properties
Chemistry of large molecules, 15:27438 (RA;US)
The DOE [Department of Energy] coal sample bank - Monitoring of coal deterioration, 15:27402 (RA;US)
Cleaning
Surface and electrochemical studies in coal cleaning: Final report, 15:27387 (R;US)
Combustion
Cofiring of pelletized refuse-derived fuel with coal to achieve sulfur dioxide emissions requirements, 15:27939 (J;US)
Development and use of an advanced coal-fueled diesel engine cycle simulation with group effects, Volume 1: Final report, 15:27487 (R;US)
Combustion Kinetics
Component wear in coal-fueled diesel engines, 15:28351 (J;US)
Cooper-Bessemer coal-fueled engine system: Progress report, 15:28348 (J;US)
Combustion Products
Detoxification and generation of useful products from coal combustion wastes: Third quarterly technical report, 15:27489 (R;US)
Flyash adhesion in simulated coal-fired gas turbine environment, 15:27938 (J;US)
Injection of deuterated methane into the stack of a coal-fired power plant to trace stack emissions, 15:27946 (B;US)
Comminution
Microfine coal combustion, 15:27492 (R;XE)
Comparative Evaluations
The DOE [Department of Energy] coal sample bank - Monitoring of coal deterioration, 15:27402 (RA;US)
Coprocessing
Interactive chemistry of coal-oil reactions using model systems, 15:27437 (J;US)
Reaction pathways of model coprocessing systems using molybdenum naphthenate and excess sulfur, 15:27436 (J;US)
Deashing
Magnetic separation of materials. October 1976-November 1989 (A Bibliography from the COMPENDEX data base). Report for October 1976-November 1989, 15:27449 (R;US)
Depolymerization
Low temperature depolymerization and liquefaction of premium U.S. coal samples, 15:27407 (RA;US)
Dredging
Comparison of the permitting processes of SMCRA and the Corps of Engineers concerning the regulation of coal-dredging activities. Final draft report, 15:27461 (R;US)
Fluidized-Bed Combustion
Compatibility of admix and synthetic liner materials with flute gas scrubbing wastes, 15:27945 (B;US)
Looking beyond the demonstration plants, 15:27508 (J;US)
Management of AFBC [atmospheric fluidised bed combustion] residues, 15:27494 (R;GB)
Fluidized-Bed Combustors
Second-generation pressurized fluidized bed combustion plant: Phase 1, Task 2 topical report—Grimethorpe tube bundle "E" wastage evaluation: Volume 1, 15:27486 (R;US)
Gasification
Cleaning and heat recovery of cement kiln bypass gas with fluxflow technology, 15:28306 (RA;FI)
Hydrogenation
Kinetics of coal hydrogenation and cracking with Lewis acids using in-situ ESR [Electron Spin Resonance] spectroscopy, 15:27406 (RA;US)
Materials Handling
Feeding of coal from mass-flow hopper outlets, 15:27484 (R;AU)
Molecular Models
Chemistry of large molecules, 15:27438 (RA;US)
Computer modeling of vitrinite: Investigation of reaction pathways and interpretation of spectral data, 15:27408 (RA;US)
Molecular Structure
Computer modeling of vitrinite: Investigation of reaction pathways and interpretation of spectral data, 15:27408 (RA;US)
[Determination of the distribution of hydrogen in coal by FTIR]: Progress report, 15:27439 (R;US)
Nmr Spectra
^{31}P NMR spectroscopic analysis of labile hydrogen functional groups: Identification with a dithiaphospholane reagent, 15:27443 (J;US)
Effect of sample spinning on detection of ^{13}C NMR in coals, 15:27442 (J;US)
Pneumatic Transport
Long distance pneumatic conveying of fly ash and pulverised coal, 15:27485 (R;AU)
Reaction Kinetics
Computer modeling of vitrinite: Investigation of reaction pathways and interpretation of spectral data, 15:27408 (RA;US)
Storage Life
The DOE [Department of Energy] coal sample bank - Monitoring of coal deterioration, 15:27402 (RA;US)
Structural Chemical Analysis
Chemistry of large molecules, 15:27438 (RA;US)
COAL FINES
A preliminary investigation of fine-coal cleaning via the Micro-Mag Process, 15:27390 (BA;US)
Coal-water slurry combustion in gas turbines, 15:27507 (J;US)
Evaluation of advanced surface-modification, gravity and electrostatic processes for fine-coal beneficiation, 15:27389 (BA;US)
Strength and consolidation characteristics of fine-coal refuse. Annual report, 15:27448 (R;US)
COAL GASIFICATION
Copper-based sorbents for hot gas cleanup, 15:27422 (RA;US)
GRI's (Gas Research Institute's) Gasification of Fossil Fuels Subprogram, status report, December 1982, 15:27429 (R;US)
GRI's (Gas Research Institute's) gasification from 1983. Fossil Fuels Subprogram status report, 15:27432 (R;US)
Mild gasification program overview, 15:27421 (RA;US)
Mineralogy of the residues from an underground coal gasification test, 15:27455 (BA;US)
Rocky mountain 1: Underground coal-gasification test, Hanna, Wyoming. Summary report, Volume 1. Appendix. Final report, 15:27430 (R;US)
Steam conditioning of coal for synfuels production, 15:27420 (RA;US)
COAL GASIFICATION PLANTS
Hydrogen production with coal using a pulverization device, 15:27791 (P;US)
Report on 1989 joint symposium on stationary combustion NO_x control, 15:29024 (R;SE;In Swedish)

Sampling and analytical procedures for the industrial-hygiene characterization of coal gasification and liquefaction pilot plants, 15:27518 (R;US)

COAL LIQUEFACTION

Catalysts
Investigation of the structure and reactions of catalysts and inorganic constituents in coal liquefaction, 15:27399 (RA;US)
Low temperature liquefaction catalysis: A progress report, 15:27401 (RA;US)
Modified ferrisilicates for synthesis gas conversion, 15:27412 (RA;US)
Promoter and binder/support effects on the activity and selectivity of precipitated iron Fischer-Tropsch catalysts, 15:27415 (RA;US)
Slurry phase Fischer-Tropsch synthesis: Cobalt plus a water-gas-shift catalyst, 15:27414 (RA;US)
Solubilization of coal by biocatalysts in organic solvents, 15:27403 (RA;US)
The development of precipitated iron catalysts with improved stability, 15:27413 (RA;US)

Chemical Reaction Kinetics
Fundamental studies of retrograde reactions in direct liquefaction, 15:27400 (RA;US)

Chemical Reactions
Studies of the initial reactions that occur during direct coal liquefaction, 15:27393 (RA;US)

Comparative Evaluations
A comparative techno-economic analysis of HRI coprocessing, catalytic two-stage liquefaction (CTSL) and H-oil, 15:27394 (RA;US)

Cost Benefit Analysis
A comparative techno-economic analysis of HRI coprocessing, catalytic two-stage liquefaction (CTSL) and H-oil, 15:27394 (RA;US)

Demonstration Programs
Catalytic two-stage liquefaction (CTSL) process studies on subbituminous coal, 15:27391 (RA;US)

Economic Analysis
Economics of advanced indirect liquefaction processes, 15:27418 (RA;US)

Economics
UOP co-processing developments, 15:27396 (RA;US)

Fuel Slurries
Bench-scale development of coal/oil co-processing technology, 15:27395 (RA;US)
Direct liquefaction contractors review meeting, 15:27398 (RA;US)
UOP co-processing developments, 15:27396 (RA;US)

Numerical Analysis
A mechanistic numerical model for coal liquefaction involving hydrogenolysis of strong bonds. Rationalization of interactive effects of solvent aromaticity and hydrogen pressure, 15:27435 (J;US)

Process Development Units
Status of the development of methanol synthesis by the LP-MEOH process, 15:27409 (RA;US)
The OCTAMIX process, 15:27411 (RA;US)

Research Programs
A solid-state NMR study of condensation/retrograde reactions during coal liquefaction, 15:27405 (RA;US)
Bench-scale development of coal/oil co-processing technology, 15:27395 (RA;US)
Bioprocessing of coal and model compounds, 15:27404 (RA;US)
Catalytic two-stage liquefaction (CTSL) process studies on subbituminous coal, 15:27391 (RA;US)
Computer modeling of vitrinite: Investigation of reaction pathways and interpretation of spectral data, 15:27408 (RA;US)
Direct liquefaction contractors review meeting, 15:27398 (RA;US)
Economics of liquid-phase methanol process, 15:27410 (RA;US)
Fundamental studies of retrograde reactions in direct liquefaction, 15:27400 (RA;US)
Heat transfer investigations in a slurry bubble column, 15:27417 (RA;US)
Hydrodynamic studies with Fischer-Tropsch waxes in three-phase bubble columns, 15:27416 (RA;US)
Investigation of the structure and reactions of catalysts and inorganic constituents in coal liquefaction, 15:27399 (RA;US)
Kinetics of coal hydrogenation and cracking with Lewis acids using in-situ ESR [Electron Spin Resonance] spectroscopy, 15:27406 (RA;US)
Low temperature depolymerization and liquefaction of premium U.S. coal samples, 15:27407 (RA;US)
Low temperature liquefaction catalysis: A progress report, 15:27401 (RA;US)
Modified ferrisilicates for synthesis gas conversion, 15:27412 (RA;US)
Promoter and binder/support effects on the activity and selectivity of precipitated iron Fischer-Tropsch catalysts, 15:27415 (RA;US)
Recent progress at the advanced coal liquefaction facility in the direct liquefaction of coal, 15:27392 (RA;US)
Slurry phase Fischer-Tropsch synthesis: Cobalt plus a water-gas-shift catalyst, 15:27414 (RA;US)
Solubilization of coal by biocatalysts in organic solvents, 15:27403 (RA;US)
Stable carbon isotope analysis of coprocessing materials, 15:27397 (RA;US)
Status of the development of methanol synthesis by the LP-MEOH process, 15:27409 (RA;US)
Studies of the initial reactions that occur during direct coal liquefaction, 15:27393 (RA;US)
The DOE [Department of Energy] coal sample bank - Monitoring of coal deterioration, 15:27402 (RA;US)
The OCTAMIX process, 15:27411 (RA;US)
The development of precipitated iron catalysts with improved stability, 15:27413 (RA;US)
UOP co-processing developments, 15:27396 (RA;US)

Technology Assessment
A comparative techno-economic analysis of HRI coprocessing, catalytic two-stage liquefaction (CTSL) and H-oil, 15:27394 (RA;US)
Status of the development of methanol synthesis by the LP-MEOH process, 15:27409 (RA;US)

COAL LIQUEFACTION PLANTS
Economics of liquid-phase methanol process, 15:27410 (RA;US)
Industrial-hygiene assessment of coal-liquefaction plants, 15:27521 (R;US)
Integrated coal to transportation liquids study, 15:27419 (RA;US)
ORNL-4(B) - Coal conversion and utilization plant support services, 15:28153 (RA;US)
Recent progress at the advanced coal liquefaction facility in the direct liquefaction of coal, 15:27392 (RA;US)
Sampling and analytical procedures for the industrial-hygiene characterization of coal gasification and liquefaction pilot plants, 15:27518 (R;US)

COAL LIQUIDS
A solid-state NMR study of condensation/retrograde reactions during coal liquefaction, 15:27405 (RA;US)
Density and viscosity of tetralin and trans-decalin, 15:27444 (J;US)
Genotoxicity of brown coal products, 15:27515 (R;AU)

COAL MINERS
Development of certification procedures for blaster-in-charge. Volume 1. Job analysis and determination of minimal experience requirements, 15:27519 (R;US)
Development of certification procedures for blaster-in-charge. Volume 2. Test development and initial validation, 15:27478 (R;US)

COAL MINES
Bowen Basin - stress, structure and mining conditions: assessment for mine planning, 15:27467 (R;AU)
Claystones of the Newcastle coal measures, 15:27474 (R;AU)
Design and engineering of lighting systems for the coal face: Volume 1, Main report, 15:27476 (R;AU)
Design and engineering of lighting systems for the coal face: Volume 2, Supplementary information, 15:27477 (R;AU)
Pressure monitoring and observed effects of mining at the Oak Grove, AL. Coalbed degasification pattern. Report of investigations/1989, 15:27433 (R;US)

Subsidence monitoring using seismic activity. Final report, 15:27480 (R;US)
Underground mining research in the Collie Coalfield, Western Australia, 15:27473 (R;AU)

COAL MINING
Concepts for protection against catastrophic events from coal mining. Final report, 15:27466 (R;US)
Economic analysis of alternative regulations for coal-processing waste. Draft report, 15:27512 (R;US)
Economic assessment of the impact on coal production due to enforcement of the Surface Mining Control and Reclamation Act of 1977. Benefits report. Volume 1. Final report, 15:27514 (R;US)
Economic evaluation of OSM (Office of Surface Mining) hydrology, geology, and air resources regulations. Final report, 15:27513 (R;US)
Economic evaluations of OSM (Office of Surface Mining) agronomic and biological sciences regulations (prime farmlands). Final report, 15:27458 (R;US)
Evaluation of wildlife mitigation practices at western coal operations. Final report, 15:27456 (R;US)
Mineral planning in Great Britain and its relevance to the American mining industry (1981). Final report, 15:27524 (R;US)
Performance-based approach to improve skills, safety, and training in the mining industry. Research report, September 1984-October 1989 (Final), 15:27517 (R;US)
The NPDES program in West Virginia: Getting back to the basics, 15:28145 (BA;US)

COAL PREPARATION
Dynamic simulation of coal preparation circuits and control systems, 15:27388 (R;AU)
Free-radical thermolysis and hydrogenolysis of model hydrocarbons relevant to processing of coal, 15:28691 (J;US)

COAL SEAMS
In seam and cross measure methane predrainage by long-hole drilling, 15:27472 (R;AU)

COAL TAR
Engineering-scale demonstration of thermal desorption technology for manufactured gas plant site soils, 15:27460 (R;US)

COAL-DERIVED LIQUIDS
See COAL LIQUIDS

COAL-FIRED GAS TURBINES
Coal-water slurry combustion in gas turbines, 15:27507 (J;US)
Flyash adhesion in simulated coal-fired gas turbine environment, 15:27938 (J;US)

COAL-OIL MIXTURES
See COAL
FUEL SLURRIES

COATING (SURFACE)
See SURFACE COATING

COATING PROCESSES
See SURFACE COATING

COBALT
Magic numbers through chemistry: Evidence for icosahedral structure of hydrogenated cobalt clusters, 15:28667 (J;US)

COBALT 57
The research group: Standards of radioactivity, 15:28875 (RA;ZA)

COBALT BASE ALLOYS
Oxidation of cobalt-chromium alloys in chlorine contaminated environments, 15:28392 (R;US)

COBALT COMPOUNDS
See also COBALT OXIDES
Low temperature depolymerization and liquefaction of premium U.S. coal samples, 15:27407 (RA;US)
Slurry phase Fischer-Tropsch synthesis: Cobalt plus a water-gas-shift catalyst, 15:27414 (RA;US)

COBALT OXIDES
Angle-resolved photoemission study of NiO and CoO, 15:28510 (BA;US)
Reactive characterization as a probe of the nature of catalytic sites: Annual technical progress report, January 1989 to January 1990, 15:28643 (R;US)

COGENERATION
Case study: Co-generation of power at the Gold River pulp mill, 15:28293 (RA;CA)
Coal-fueled diesels: Systems development, 15:28357 (J;US)
Cogeneration, 15:27950 (R;SE;In Swedish)
Cogeneration and gas-cooling research status report, 1984-85, 15:28254 (R;US)
District heating cogeneration plants based on SOFC and MCFC: Joint study, 15:28219 (R;SE)
Preparatory projecting of power production at the Djuped plant, 15:28338 (R;SE;In Swedish)
Turbine-generator replacement study, 15:27940 (J;US)

COGENERATION PLANTS
See DUAL-PURPOSE POWER PLANTS

COHERENT ANTI-STOKES RAMAN SPECTROSCOPY
See RAMAN SPECTROSCOPY

COLD PLASMA
15th Czechoslovak seminar on plasma physics and technology. Part 1, 15:29622 (R;CS;In English, Russian)
On the potential of CARS spectroscopy in low-temperature plasma diagnostics, 15:29644 (RA;CS;In Russian)
Plasma temperature measurements based on discrete atomic and molecular spectra - a critical discussion, 15:29642 (RA;CS)
Spectroscopic diagnostics of some plasmas used in technology processes, 15:29643 (RA;CS)

COLLIERIES
See COAL MINES

COLLISIONAL PLASMA
Theory of neoclassical pressure-gradient-driven turbulence, 15:29781 (J;US)

COLLODION
See NITROCELLULOSE

COLLOIDS
See also FOAMS
GELS
Experimental studies on the rheology of hard-sphere suspensions near the glass transition, 15:28655 (J;US)
NMR and neutron-scattering studies on poly(ethylene oxide) terminally attached at the polystyrene/water interface, 15:28573 (J;US)

COLOGNE SPIRITS
See ETHANOL

COLORADO
Superfund Record of Decision (EPA Region 8): Woodbury Chemical, Commerce City, CO. (Second remedial action), September 1989. Final report, 15:27570 (R;US)

COLUMBIUM
See NIOBIUM

COLUMNS (MECHANICAL)
See MECHANICAL STRUCTURES

COMBINED GAS AND STEAM CYCLE POWER PLANTS
See COMBINED-CYCLE POWER PLANTS

COMBINED STEAM-POWER GENERATION
See COGENERATION

COMBINED-CYCLE POWER PLANTS
Heat balance calculations on a combined-cycle power plant with the program GTPRO, 15:27899 (R;SE;In Swedish)
Looking beyond the demonstration plants, 15:27508 (J;US)

COMBUSTION
See also FLUIDIZED-BED COMBUSTION
A new experimental approach to study solid combustion reactions using synchrotron radiation, 15:28687 (R;US)
Combustion of droplets and particles, 15:27504 (R;SE;In Swedish)
Direct numerical simulations of a plane compressible wake: Stability, vorticity dynamics, and topology, 15:28283 (R;US)
Experimental research of pressurized fluidized bed technology and its application to power and heat cogeneration: Summary, 15:27505 (R;FI;In Finnish)
Measurement of OH rotational temperatures in a flame using degenerate four-wave mixing, 15:28689 (J;US)
Time-resolved two-photon-excited fluorescence detection of atomic hydrogen in flames, 15:28690 (J;US)

COMBUSTION CHAMBERS
Combustion of droplets and particles, 15:27504 (R;SE;In Swedish)
Economic impact of air-pollutant emission guidelines for existing municipal-waste combustors. Final report, 15:28326 (R;US)
Field evaluation of low-emission coal-burner technology on utility boilers. Volume 4. Alternative concepts for SOx, NOx, and particulate emissions control from a fuel-rich precombustor. Final report, September 1978-June 1986, 15:27500 (R;US)
Municipal-waste combustors - background information for proposed guidelines for existing facilities. Volume 5. Final report, 15:28325 (R;US)
Municipal-waste combustors - background information for proposed standards: 111(b) model plant description and cost report. Volume 2. Final report, 15:28322 (R;US)
Municipal-waste combustors - background information for proposed standards: Control of NOx emissions. Volume 4. Final report, 15:28324 (R;US)
Municipal-waste combustors - background information for proposed standards: cost procedures. Volume 1. Final report, 15:28321 (R;US)

COMBUSTION CONTROL
Combustion system technology and application assessment: Combustion control systems. Topical report, February 1989, 15:27644 (R;US)

COMBUSTION KINETICS
A new experimental approach to study solid combustion reactions using synchrotron radiation, 15:28687 (R;US)

COMBUSTION PRODUCTS
Determining the relative toxicity and smoke obscuration of combustion products of mine combustibles. Report of Investigations/1990, 15:29001 (R;US)
Mineralogy of the residues from an underground coal gasification test, 15:27455 (BA;US)
Volatilisation and removal of trace metals at high temperatures, 15:29029 (RA;FI)

COMBUSTORS
See also FLUIDIZED-BED COMBUSTORS
Coal-fired MHD [magnetohydrodynamics] combustor development project, Phase 3D: Final technical report, 30 April 1984–31 May 1987, 15:28216 (R;US)
Development of retrofit external slagging combustor: Phase 1, Final technical report, 15:27488 (R;US)
Large scale systems, 15:27828 (RA;CA)
Scale-up of circulating fluidized bed coal combustors: Technical progress report, December 1, 1989–February 28, 1990, 15:27490 (R;US)
Small scale systems, 15:27829 (RA;CA)

COMETS
See also HALLEY COMET

Activation Analysis
Prompt Gamma Activation Analysis (PGAA): Technique of choice for nondestructive bulk analysis of returned comet samples, 15:29305 (RA;US)

Agglomeration
Comments on comet shapes and aggregation processes, 15:29297 (RA;US)

Carbon
The carbon chemistry of meteorites: Relationships to comets, 15:29291 (RA;US)

Chemical Analysis
Analysis of organic compounds in returned comet nucleus samples, 15:29293 (RA;US)
Analytical study of comet nucleus samples, 15:29284 (RA;US)
Thermal and chemical processing of the outermost layer of cometary nuclei, 15:29290 (RA;US)

Chemical Composition
Cosmogenic nuclides in cometary materials: Implications for rate of mass loss and exposure history, 15:29298 (RA;US)
Direct determination of the morphology, structure and composition of cometary and interstellar ice analogs in the laboratory, 15:29288 (RA;US)
From interstellar dust to comets, 15:29295 (RA;US)
Modifications of comet materials by the sublimation process: Results from simulation experiments, 15:29296 (RA;US)
The origin, composition and history of cometary ices from spectroscopic studies, 15:29285 (RA;US)

Chemical Radiation Effects
Ion bombardment experiments suggesting an origin for organic particles in pre-cometary and cometary ices, 15:29323 (RA;US)

Compressibility
Mechanical and SEM analysis of artificial comet nucleus samples, 15:29321 (RA;US)

Cosmochemistry
Non-equilibrium chemistry in the solar nebula and early solar system: Implications for the chemistry of comets, 15:29294 (RA;US)
Physical processing of cometary nuclei, 15:29324 (RA;US)

Cosmological Models
Non-equilibrium chemistry in the solar nebula and early solar system: Implications for the chemistry of comets, 15:29294 (RA;US)

Dust Collectors
Trajectory-capture cell instrumentation for measurement of dust particle mass, velocity and trajectory, and particle capture, 15:29315 (RA;US)

Electron Microprobe Analysis
Analysis of particulates of comet nucleus samples: Possible use of olivine as indicator phase, 15:29317 (RA;US)

Electron Microscopy
Direct determination of the morphology, structure and composition of cometary and interstellar ice analogs in the laboratory, 15:29288 (RA;US)
Electron beam analysis of particulate cometary material, 15:29289 (RA;US)

Electron Spin Resonance
Electron Spin Resonance (ESR) studies of returned comet nucleus samples, 15:29322 (RA;US)

Gases
Experimental studies of gas trapping in amorphous ice and thermal modelling of comets: Implications for Rosetta, 15:29286 (RA;US)

Geologic History
Cosmogenic nuclides in cometary materials: Implications for rate of mass loss and exposure history, 15:29298 (RA;US)
Measurements of long-lived cosmogenic nuclides in returned comet nucleus samples, 15:29311 (RA;US)
Thermal histories of the samples of two KOSI comet nucleus simulation experiments, 15:29316 (RA;US)

Heat Transfer
Thermal histories of the samples of two KOSI comet nucleus simulation experiments, 15:29316 (RA;US)

Ice
Experimental studies of gas trapping in amorphous ice and thermal modelling of comets: Implications for Rosetta, 15:29286 (RA;US)

Isotope Ratio
Cosmogenic nuclides in cometary materials: Implications for rate of mass loss and exposure history, 15:29298 (RA;US)
Isotopic microanalysis of returned comet nucleus samples, 15:29326 (RA;US)
Measurements of long-lived cosmogenic nuclides in returned comet nucleus samples, 15:29311 (RA;US)
On the isotope analysis of cometary dust, 15:29287 (RA;US)
The carbon chemistry of meteorites: Relationships to comets, 15:29291 (RA;US)

Materials Handling
Handling and analysis of ices in cryostats and glove boxes in view of cometary samples, 15:29314 (RA;US)

Metamorphism
Metamorphism of cosmic dust: Processing from circumstellar outflows to the cometary regolith, 15:29312 (RA;US)

Microanalysis
Isotopic microanalysis of returned comet nucleus samples, 15:29326 (RA;US)

The measurement of trace elements in interplanetary dust and cometary particles by ultra-high sensitivity INAA, 15:29327 (RA;US)

Microscopy
Methods for the mineralogical and textural analysis of comet nucleus samples, 15:29319 (RA;US)

Microstructure
Direct determination of the morphology, structure and composition of cometary and interstellar ice analogs in the laboratory, 15:29288 (RA;US)
Mechanical and SEM analysis of artificial comet nucleus samples, 15:29321 (RA;US)

Morphology
Direct determination of the morphology, structure and composition of cometary and interstellar ice analogs in the laboratory, 15:29288 (RA;US)
From interstellar dust to comets, 15:29295 (RA;US)

Organic Compounds
Analysis of organic compounds in returned comet nucleus samples, 15:29293 (RA;US)
Ion bombardment experiments suggesting an origin for organic particles in pre-cometary and cometary ices, 15:29323 (RA;US)

Petrography
Methods for the mineralogical and textural analysis of comet nucleus samples, 15:29319 (RA;US)

Physical Properties
What if chondritic porous interplanetary dust particles are not the real McCoy, 15:29313 (RA;US)

Physical Radiation Effects
Electron Spin Resonance (ESR) studies of returned comet nucleus samples, 15:29322 (RA;US)
Radiation modification of cometary materials: Laboratory simulations, 15:29300 (RA;US)

Porosity
What if chondritic porous interplanetary dust particles are not the real McCoy, 15:29313 (RA;US)

Refractories
Refractory solids in chondrites and comets: How similar, 15:29325 (RA;US)

Sampling
Candidate sample acquisition systems for the Rosetta, 15:29307 (RA;US)
Handling and analysis of ices in cryostats and glove boxes in view of cometary samples, 15:29314 (RA;US)
The comet rendezvous asteroid flyby mission, 15:29310 (RA;US)
The nature of cometary materials, 15:29318 (RA;US)

Shape
Comments on comet shapes and aggregation processes, 15:29297 (RA;US)

Spectra
Spectrophotometric observations of comet P/Giacobini-Zinner, 15:29303 (RA;US)

Spectroscopy
Laboratory analyses of micron-sized solid grains: Experimental techniques and recent results, 15:29292 (RA;US)
The origin, composition and history of cometary ices from spectroscopic studies, 15:29285 (RA;US)

Sublimation
Modifications of comet materials by the sublimation process: Results from simulation experiments, 15:29296 (RA;US)

Sulfur Compounds
Sulfur compounds in comets, 15:29301 (RA;US)

Temperature Effects
Electron Spin Resonance (ESR) studies of returned comet nucleus samples, 15:29322 (RA;US)
Experimental studies of gas trapping in amorphous ice and thermal modelling of comets: Implications for Rosetta, 15:29286 (RA;US)
Thermal histories of the samples of two KOSI comet nucleus simulation experiments, 15:29316 (RA;US)

Thermal Analysis
Thermal and chemical processing of the outermost layer of cometary nuclei, 15:29290 (RA;US)

Trace Amounts
The measurement of trace elements in interplanetary dust and cometary particles by ultra-high sensitivity INAA, 15:29327 (RA;US)

Water
The carbon chemistry of meteorites: Relationships to comets, 15:29291 (RA;US)

X-Ray Fluorescence Analysis
Non-destructive trace element microanalysis of as-received cometary nucleus samples using synchrotron x ray fluorescence, 15:29320 (RA;US)

COMMENSALISM
See SYMBIOSIS

COMMERCIAL BUILDINGS
Commercial building least-cost planning data development: Final report, 15:28232 (R;US)
Feasibility study, central chilled water system, downtown Baltimore, Maryland, 15:28316 (R;US)

COMMUNITIES (ECOLOGICAL)
See ECOSYSTEMS

COMPACT IGNITION TOKAMAK
Ohmic and alpha heating in the high-field IGNITEX Tokamak, 15:29839 (BA;US)

COMPACTIFICATION
Spontaneous compactification and structure of gauge vacua in six-dimensional gauge theory, 15:29492 (R;JP)

COMPOSITE MATERIALS

In-situ fracture stiffness determination, 15:27697 (R;US)
DEFORMED NUCLEI
Structures of exotic nuclei, 15:29561 (BA;US)
DEGRADATION (NUCLEAR)
See DECAY
DEHUMIDIFIERS
Integrated gas-fired desiccant dehumidification vapor-compression cooling system for residential application. Phase 2. Final report, December 1987-December 1988, 15:28260 (R;US)
DELAYED NEUTRON FRACTION
Evaluation of effective delayed neutron fraction and prompt neutron lifetime for High Temperature Engineering Test Reactor (HTTR), 15:28026 (R;JP;In Japanese)
DELAYED PROTONS
Properties of light nuclei very far from beta stability, 15:29519 (R;FR)
DELTA RESONANCES (MESON)
See MESONS
DENDRITES
A boundary integral approach to unstable solidification, 15:29616 (J;US)
DENITRIFICATION
Optimization study of the X-700 Biodenitrification Plant, 15:27720 (R;US)
DENSITY
Non-destructive measurement of wood characteristics: Part 5. Gamma measurements, 15:28732 (R;FI;In Finnish)
DENSITY (PLASMA)
See PLASMA DENSITY
DEOXYPENTOSE NUCLEIC ACID
See DNA
DEOXYRIBONUCLEIC ACID
See DNA
DEPLETION (ISOTOPIC)
See ISOTOPE SEPARATION
DERMATITIS
Health-hazard evaluation report HETA 88-156-1984, Georgia Gulf Corporation, Tiptonville, Tennessee, 15:29241 (R;US)
DESERTRON
See SUPERCONDUCTING SUPER COLLIDER
DESIGN
Optimization of a heat pump plant with a computer program, 15:28249 (R;FI;In Finnish)
DESOXYRIBONUCLEIC ACID
See DNA
DESULFURIZATION
Spray-dryer spent-sorbent hazardous-waste fixating and cementitious properties, 15:27446 (R;US)
DETECTION (NUCLEAR EXPLOSIONS)
See NUCLEAR EXPLOSION DETECTION
DETECTORS (RADIATION)
See RADIATION DETECTORS
DETONATORS
See also FUSES
Ignition testing of low-energy laser diode ignited components, 15:28752 (R;US)
Voltage delay in Li/$SOCl_2$ cells for artillery applications at −35°C, 15:28113 (R;US)
DEUTERIUM
Deuterium permeability in gold determined using ion beams, 15:28450 (J;US)
Effect of ion speed distribution on the spectral shape of the 2.5 MeV neutron line produced in D-D fusion, 15:29724 (BA;US)
Relativistic effects on electromagnetic interaction of deuteron, 15:29472 (RA;JP)
DEUTERIUM-LITHIUM HIGH FLUX NEUTRON SOURCE FACILITY
See NEUTRON SOURCE FACILITIES
DEUTERON REACTIONS
0 deg measurement of $^3He(p,n)^3Li$ and $^2H(d,d^*)d$ reactions, 15:29526 (RA;JP;In Japanese)

Analyzing power for the $^{3}He(d,dd)^{1}H$ reaction at 59.5 MeV, 15:29528 (RA;JP;In Japanese)
Analyzing powers in p+d scattering at low energy, 15:29530 (RA;JP;In Japanese)
Deuteron breakup reaction with strong p-n final state interaction, 15:29525 (RA;JP)
Energy dependence of the $^{2}H(d,dp)n$ reaction, 15:29527 (RA;JP;In Japanese)

DEUTERON-DEUTERON INTERACTIONS
See DEUTERON REACTIONS

DEVONIAN SHALES
See BLACK SHALES

DEWAR FLASKS
See DEWARS

DEWARS
A refrigerated Dewar for the Josephson array voltage calibration system, 15:28706 (R;US)

DIABLO CANYON-1 REACTOR
The value of on-site sodars versus nearest radiosonde soundings in regional emergency response modeling, 15:28989 (R;US)

DIAL PAINTERS
Central nervous system tumours and related intracranial pathologies in radium dial workers, 15:29185 (BA;GB)
Comparison of radium-induced and natural bone sarcomas by histological type, subject age and site of occurrence, 15:29184 (BA;GB)
External radiation doses received by female radium dial painters, 15:29186 (BA;GB)
Eye changes induced by radium, 15:29187 (BA;GB)

DIAMONDS
Materials processing of diamond: Etching, doping by ion implantation, and contact formation. Annual technical report, 1 October 1988-30 September 1989, 15:28524 (R;US)
Thin diamond films for tribological applications, 15:28568 (BA;US)

DIBARYON RESONANCES
See DIBARYONS

DIBARYONS
Search for narrow dibaryon, 15:29448 (RA;JP;In Japanese)
Search for the H dihyperon by double weak decay of nuclei, 15:29531 (RA;JP)

DIESEL ENGINES
Biogas as a vehicle fuel, 15:28361 (RA;SE;In Swedish)
Coal-fueled diesels: Systems development, 15:28357 (J;US)
Component wear in coal-fueled diesel engines, 15:28351 (J;US)
Control of diesel particulate matter in underground coal mines. Report of Investigations/1989, 15:27522 (R;US)
Cooper-Bessemer coal-fueled engine system: Progress report, 15:28348 (J;US)
Environmental aspects of coal-fueled diesel engines, 15:28356 (J;US)
In depth survey report of Carolina Freight Carriers, Carlisle, Pennsylvania, and York, Pennsylvania, 15:29239 (R;US)
In-depth survey report of Roadway Express, Inc., Toledo, Ohio, 15:29008 (R;US)
NIST-3 - Mechanisms of galling and abrasive wear, 15:28344 (RA;US)
Piston ring thermal transient effects on lubricant temperatures in advanced engines, 15:28349 (J;US)
Quantitative analysis of diesel particulate matter in respirable coal dust by Raman spectroscopy. Research report (Final), 1 January 1987-1 July 1988, 15:27520 (R;US)
Testing and modelling at Riso National Laboratory of the Chalmers 22/18 kW wind/diesel system, 15:27889 (RA;DK)
Waste heat recovery retrofit project, 15:28317 (R;CA)

DIESEL FUELS
Installation-restoration Program, Phase 2. Confirmation/quantification, Stage 1. Kalispell Air Force Station, Montana. Final report, October 1986-March 1989, 15:27562 (R;US)

DIESEL OIL (FRACTION)
See DIESEL FUELS

DIFFERENTIAL EQUATIONS
See also PARTIAL DIFFERENTIAL EQUATIONS
Parallel approach for solving stiff systems of ODE's, 15:29900 (R;GB)

DIFFUSION

DIGITAL SYSTEMS
Using a new generation of multimeters to measure the quantized resistance, 15:28762 (R;US)

DIMETHYLBENZENES
See XYLENES

DIODE TRANSISTORS
See TRANSISTORS

DIOXIN
Investigation of the ability of different sorbent combinations to reduce hydrochloric acid and sulphur dioxide and influence on the production of dioxines during incineration of refuse derived fuels, 15:29025 (R;SE;In Swedish)
Sampling dioxin, 15:29021 (R;SE;In Swedish, English)

DIRECTED-ENERGY WEAPONS
See also LASER WEAPONS
Target returns for neutral-particle-beam discrimination, 15:28975 (R;US)

DISCHARGES (WASTES)
See WASTE DISPOSAL

DISINTEGRATION (NUCLEAR)
See DECAY

DISPERSANTS (CHEMICAL)
See SURFACTANTS

DISPLACEMENT FLUIDS
Suspended solids removal from fresh water makeup for waterflood, 15:27545 (RA;US)

DISPLACEMENT GAGES
Characterization and calibration of coordinate measuring machines, 15:28959 (R;US)

DISPOSAL (WASTES)
See WASTE DISPOSAL

DISSOLUTION
A kinetic model for borosilicate glass dissolution based on the dissolution affinity of a surface alteration layer, 15:27736 (R;US)

DISSOLVED OXYGEN
See OXYGEN

DISTRIBUTION FACTOR (RAD DOSES)
See SPATIAL DOSE DISTRIBUTIONS

DISTRICT COOLING
DOE grant for assessment of district cooling system for University of Arkansas for Medical Sciences, Little Rock, Arkansas, 15:28231 (R;US)
District cooling: Phase 2, Direct freeze ice slurry system testing: [Project status], 15:28230 (R;US)
Feasibility study, central chilled water system, downtown Baltimore, Maryland, 15:28316 (R;US)

DISTRICT HEATING
Energy supply in Jyvaeskylae, 15:28319 (RA;FI;In Finnish)
Remote analysis of substations, 15:28339 (R;SE;In Swedish)

DNA
Production of DNA strand breaks by direct effects of heavy charged particles, 15:29191 (J;US)

DNA POLYMERASES
Key involvement of poly (ADP-ribosylation) in defense against toxic agents in molecular biology studies. Annual report, November 1988-November 1989, 15:29113 (R;US)

DOEL-2 REACTOR
Belgian approach to steam generator tube plugging for primary water stress corrosion cracking: Final report, 15:27966 (R;US)

DOEL-3 REACTOR
Belgian approach to steam generator tube plugging for primary water stress corrosion cracking: Final report, 15:27966 (R;US)

DOLOMITE
Analysis of the fluid-pressure responses of the Rustler Formation at H-16 to the construction of the air-intake shaft at the Waste Isolation Pilot Plant (WIPP) site, 15:27734 (R;US)

DOMESTIC WASTES
See MUNICIPAL WASTES
DORIS STORAGE RING
Status and limits of DORIS II, 15:29402 (RA;US)
DORMITORIES

FLOORS
Claystones of the Newcastle coal measures, 15:27474 (R;AU)
FLOW (FLUID)
See FLUID FLOW
FLOW MODELS
Index and consistency analysis for DAE [differential-algebraic equation] systems for Stefan-Maxwell diffusion-reaction problems, 15:29377 (R;US)
Numerical and physical modelling of bubbly flow phenomena: Progress report, July 1, 1989–March 31, 1990, 15:28715 (R;US)
FLOWMETERS
The API/GPA experimental data base, 15:27632 (RA;CA)
FLUE GAS
Compatibility of admix and synthetic liner materials with flute gas scrubbing wastes, 15:27945 (B;US)
Dielectric-Barrier Discharge for the Romoval of SO_2 from flue gas, 15:27947 (BA;US)
Flue gas analysis with DOAS-technique: Experiences from a test period with the Opsis measuring system, 15:29026 (R;SE;In Swedish)
Magnetic separation of materials. October 1976-November 1989 (A Bibliography from the COMPENDEX data base). Report for October 1976-November 1989, 15:27449 (R;US)
Mineralogy of weathered flue gas desulfurization sludges, 15:27454 (BA;US)
Spray-dryer spent-sorbent hazardous-waste fixating and cementitious properties, 15:27446 (R;US)
Trace elements removal from hot flue gases, 15:29030 (R;FI)

FLUID FLOW
See also CAPILLARY FLOW
COMPRESSIBLE FLOW
GAS FLOW
MULTIPHASE FLOW
SOLIDS FLOW
TRANSITION FLOW
TURBULENT FLOW
TWO-PHASE FLOW
Experimental observations on transition to turbulence in confined coaxial jets and other boundary layer flows, 15:28718 (R;US)
Flow and transport of radionuclides in unsaturated fractured basalt, 15:27680 (R;US)
Fluid flow calculations using a multigrid method and an improved discretization scheme, 15:28728 (J;US)
Implementing the particle method on the iPSC/2, 15:29379 (R;US)
Junction-based interphase drag and vertical stratification modifications for RELAP5/MOD3, 15:27964 (R;US)
The effects of tortuosity on flow through a natural fracture, 15:27530 (R;US)

FLUIDIZED BED BOILERS
Emissions from a circulating fluidized bed boiler 2, 15:27445 (R;SE)
Sulphur capture in a 16 MW fluidized bed boiler - decomposition of $CaSO_4$ at high temperatures, 15:27451 (R;SE)

FLUIDIZED-BED COMBUSTION
Looking beyond the demonstration plants, 15:27508 (J;US)

FLUIDIZED-BED COMBUSTORS
LBL-3 - Studies of materials erosion in coal conversion and utilization systems, 15:27926 (RA;US)
Load control by slumping in fluidized bed boilers, 15:27502 (R;SE)
Municipal waste combustion assessment: Fluidized bed combustion. Final report, October 1988-July 1989, 15:28332 (R;US)
TGA determination of the sulphur dioxide absorption capacity of some Spanish limestones, 15:27450 (R;SE)

FLUORESCENCE SPECTROSCOPY
Studies of cellular damage induced by X-rays and visible light: Methods and preliminary studies, 15:29183 (R;NO;In Norwegian)

FLUORIMETRY
See FLUORESCENCE SPECTROSCOPY

FLUORINE COMPOUNDS
Photolithography of polytetrafluoroethylene for tailored adhesion, 15:28566 (BA;US)

FLY ASH
By-product sulfur from the stabilization of coal solid wastes, 15:27453 (BA;US)
Fly ash formation and sulphation during the combustion of brown coal, 15:27495 (R;AU)
Flyash adhesion in simulated coal-fired gas turbine environment, 15:27938 (J;US)
Heat of hydration and characterization of reaction products of adiabatically cured fly ash and slag mixtures, 15:27452 (BA;US)
Immobilization of incinerator ash in a concrete matrix, 15:27748 (BA;US)
Long distance pneumatic conveying of fly ash and pulverised coal, 15:27485 (R;AU)
Magnetic separation of materials. October 1976-November 1989 (A Bibliography from the COMPENDEX data base). Report for October 1976-November 1989, 15:27449 (R;US)

FOAMS
Decontamination by foams: A promising treatment for the removal of radioactive dust from gas streams, 15:27765 (R;GB)

FOILS
An improved technique for reading C-39 track etch neutron dosimeters, 15:29571 (R;US)
Improved methods and novel techniques for jet electropolishing of TEM [transmission electron microscope] foils, 15:28388 (R;US)

FOKKER-PLANCK COEFFICIENTS
See FOKKER-PLANCK EQUATION

FOKKER-PLANCK EQUATION
Angular Fokker-Planck decomposition and representation techniques, 15:28009 (J;US)

FOLIAGE
See LEAVES

FOLIAR UPTAKE
Quantitative studies on pollutant uptake by leaves: Cuticular permeability with particular regard to lateral heterogeneity of leaf surfaces, 15:29219 (RA;DE;In German)
Studies in uptake and turnover of tritiated water vapour (HTO) by vegetables, 15:29230 (R;DE;In German)

FOOD
See also ANIMAL FEEDS
Macroecology: The division of food and space among species on continents, 15:29061 (J;US)
Mutagenicity of cooked foods, 15:28311 (R;FI;In Finnish)

FOOD CHAINS
Statistical aspects of reconstructing the ^{131}I dose to the thyroid of individuals living near the Hanford Site in the mid-1940s, 15:29182 (R;US)

FOOD INDUSTRY
A manufacturing plant bioenergy system, 15:28295 (RA;CA)
Anaerobic filters for agricultural energy plants and industrial waste water plants, 15:27824 (RA;SE;In Danish)
Mutagenicity of cooked foods, 15:28311 (R;FI;In Finnish)

FOOD IRRADIATION
See FOOD PROCESSING

FOOD PROCESSING
Development of a gas-fired rethermalization oven. Final report, April 1987-September 1989, 15:28289 (R;US)

FOODSTUFFS
See FOOD

FORCING FUNCTIONS
Measuring techniques for determination of the load on the outer shell in the critical phase, 15:28740 (RA;DE;In German)

FORECASTING
Seasonal weather forecast verification: Final report, 15:28987 (R;US)

FORESTS
1st PBWU status seminar on forest decline. Proceedings, 15:29198 (R;DE;In German)
Dynamics of humic substances in polluted forest sites. Experimental concept and preliminary results, 15:28991 (RA;DE;In German)
Effects of acid rain and liming on a spruce site (Hoeglwald project), 15:29207 (RA;DE;In German)
Forest decline research at the Bavarian Forest National Park, 15:29199 (RA;DE;In German)
Production, behaviour and deposition of gaseous, particulate, and droplet-shaped reaction products, 15:28990 (RA;DE;In German)
Project energy forest cultivation, Swedish university of agricultural sciences: Annual report April 1988 to March 1989, 15:27799 (R;SE;In Swedish)
Signature analysis and classification results of pine of different vitality classes using airborne thematic mapper data, 15:29194 (R;DE;In German)
Techniques and methods of integrated removals of forest fules and industrial wood by final felling, 15:27801 (R;SE;In Swedish)
Testing the scale-dependence of models of resource competition and environmental conditions for forest structure and dynamics: Annual performance report, 15:27794 (R;US)
The research concept for investigations of forests of the Northern Alps, 15:28992 (RA;DE;In German)

FORMALDEHYDE
Urea/phenol/melamine formaldehyde polymeric resins. January 1970-February 1990 (A Bibliography from the NTIS data base). Report for January 1970-February 1990, 15:29249 (R;US)

FORMALIN

FOSSIL-FUEL POWER PLANTS
3M-4 - Fabrication of commercial-scale fiber-reinforced hot-gas filters by chemical vapor deposition, 15:27936 (RA;US)
ANL-3 - Corrosion and mechanical properties of alloys in FBC and mixed-gas environments, 15:27923 (RA;US)
B and W-2 - Evaluation of the fabricability of advanced austenitic tubing, 15:27915 (RA;US)
BCL-3 - Investigation of the effects of microalloying constituents and oxidation conditions on the development and breakdown of protective oxide layers, 15:27924 (RA;US)
CERAMATEC-1 - Design, fabrication, and interface characterization of ceramic fiber-ceramic matrix composites, 15:27901 (RA;US)
CSM-2 - Investigation of the weldability of polycrystalline iron aluminides, 15:27916 (RA;US)
CU-2 - Mechanical properties and microstructural stability of advanced austenitic alloys, 15:27917 (RA;US)
CWR-3 - Investigation of the effects of microalloy constituents, surface treatment and oxidation conditions on the development and breakdown of protective oxide scales, 15:27925 (RA;US)
FW-2 - Fireside corrosion testing of candidate superheater tube alloys, coating, and cladding, 15:27943 (RA;US)
GT-1 - Development of advanced fiber-reinforced ceramics, 15:27903 (RA;US)
GT-1(A) - Modeling of fibrous preforms for CVD infiltration, 15:27902 (RA;US)
INEL-1(A) - Nondestructive evaluation of advanced ceramic composite materials, 15:27904 (RA;US)
INEL-1(B) - Joining of silicon carbide-reinforced ceramics, 15:27905 (RA;US)
INEL-1(C) - Superconducting film fabrication, 15:27906 (RA;US)
INEL-2(A) - Consolidation of rapidly solidified aluminide metal powders, 15:28406 (RA;US)
LANL-1 - Short fiber reinforced structural ceramics, 15:27907 (RA;US)
LBL-3 - Studies of materials erosion in coal conversion and utilization systems, 15:27926 (RA;US)
MIT-3 - Materials data base development for refractories, 15:27927 (RA;US)
NCAT-1 - Mechanical properties testing of ceramic fiber-ceramic matrix composites, 15:27909 (RA;US)
NIST-1 - Structural reliability and damage tolerance of ceramic composites for high-temperature applications, 15:27908 (RA;US)
ORAU-3 - Study of the incubation stage of erosion of 1,100 aluminum, 15:27928 (RA;US)
ORGDP-1 - Development of ceramic membranes for gas separation, 15:27910 (RA;US)
ORNL-1(A) - Fabrication of fiber-reinforced composites, 15:27911 (RA;US)
ORNL-1(C) - Characterization of fiber-CVD matrix interfacial bonds, 15:27912 (RA;US)
ORNL-1(D) - Microwave sintering of ceramics, 15:27913 (RA;US)
ORNL-2(F) - Development of iron aluminides, 15:27919 (RA;US)
ORNL-3(A) - Development of surface treatments and alloy modifications for corrosion-resistant oxide scales, 15:28407 (RA;US)
ORNL-3(B) - Effects of a reactive element on the impact response of oxide scales, 15:27929 (RA;US)
OSU-2 - Fundamental study of aluminizing and chromizing processes, 15:27920 (RA;US)
PNL-1(A) - Investigation of electrochemical processes in high-temperature solid electrolytes, 15:27914 (RA;US)
SNL-1 - Ceramic catalyst materials: Hydrous metal oxide ion-exchange supports for direct coal liquefaction, 15:27428 (RA;US)
UCB-3 particle motion in flows past tubes, 15:27931 (RA;US)
UCIN-3 - Study of particle rebound characteristics and material erosion at high temperatures, 15:27933 (RA;US)
UCIN-3(A) - High temperature corrosion of aluminides, 15:27932 (RA;US)
UES-3 - Investigation of the effects of microalloy constituents, surface treatments and oxidation conditions on the development and breakdown of protective oxide scales, 15:27930 (RA;US)
UTN-2 - Investigation of welding and joining techniques for advanced austenitic alloys, 15:27921 (RA;US)
UTN-3 - Aqueous corrosion of iron aluminides, 15:27935 (RA;US)
WHC-2 - Investigation of electro-spark deposited coatings for protection of materials in sulfidizing atmospheres, 15:27922 (RA;US)

Air Pollution
Report on 1989 joint symposium on stationary combustion NO_x control, 15:29024 (R;SE;In Swedish)

Air Pollution Abatement
Cofiring of pelletized refuse-derived fuel with coal to achieve sulfur dioxide emissions requirements, 15:27939 (J;US)

Air Pollution Control
Compatibility of admix and synthetic liner materials with flute gas scrubbing wastes, 15:27945 (B;US)

Air Pollution Monitoring
Examination of the relationship between Navajo generating station emissions and aerosol concentrations at Page, Arizona, 15:29034 (B;US)
Injection of deuterated methane into the stack of a coal-fired power plant to trace stack emissions, 15:27946 (B;US)

Austenitic Steels
Experience of austenitic materials in fossil-fuel boilers, 15:28412 (R;SE;In Swedish)

Coordinated Research Programs
NIST-4 - An assessment of fossil energy materials research needs, 15:28152 (RA;US)

Economy

Developments in the proving room, 15:27631 (RA;CA)
Primary device research: Meter tube roughness effects on orifice metering, 15:27618 (RA;CA)
Quality Control
Meter shop accreditation, 15:27608 (RA;CA)

GAS TURBINE ENGINES
Evaluating thermographic phosphors in an operating turbine engine, 15:28343 (R;US)

GAS TURBINES
See also COAL-FIRED GAS TURBINES
Steam injection in gas turbines: Heat balance calculations on a plant with internal production of distilled water, 15:27898 (R;SE;In Swedish)

GAS UTILITIES
Load research: End use analysis and applications, 15:27602 (RA;CA)

GAS WELLS
See NATURAL GAS WELLS

GAS-INSULATED CABLES
Three-conductor compressed-gas cable field demonstration: Volume 2, Testing: Final report, 15:28098 (R;US)

GASEOUS DIFFUSION
A study on molecular flow by Monte Carlo method, 15:28716 (RA;JP;In Japanese)

GASEOUS DIFFUSION PLANTS
See also PADUCAH PLANT
PORTSMOUTH GASEOUS DIFFUSION PLANT
Potential exposures from uranium enrichment, 15:27763 (BA;US)

GASES
See also AIR
ELECTRON GAS
EXHAUST GASES
FUEL GAS
Cleaning and heat recovery of cement kiln bypass gas with fluxflow technology, 15:28306 (RA;FI)
Current status of the NAVSEA backscatter absorption gas imaging (BAGI) development project, 15:29037 (BA;US)
Interaction of molecules with surfaces, 15:28381 (RA;US)
Liquefaction of cotton stalk with acetic acid and sodium hydroxide AT5MPa, 15:28688 (RA;FI)
Purification of tarry gasification gas by catalysts, 15:27434 (R;FI;In Finnish)

GASIFICATION
See also COAL GASIFICATION
Experimental research of pressurized fluidized bed technology and its application to power and heat cogeneration: Summary, 15:27505 (R;FI;In Finnish)

GASOHOL
A comparison of the durability of methanol and gasoline fuelled vehicles, 15:28360 (R;CA)

GASOLINE
Cold weather methanol vehicle demonstration fleet at Argonne National Laboratory: Implications for flexible fuel and dedicated methanol commercialization, 15:28362 (B;US)

GASOLINE ENGINES
See INTERNAL COMBUSTION ENGINES

GAUGE INVARIANCE
Spontaneous compactification and structure of gauge vacua in six-dimensional gauge theory, 15:29492 (R;JP)

GAUGE TRANSFORMATIONS
See GAUGE INVARIANCE

GEL PERMEATION CHROMATOGRAPHY
Use of multiple detectors in size exclusion chromatography of large water soluble polymers, 15:27541 (RA;US)

GELS
Introducing EOR technology to independent operators, 15:27549 (RA;US)
Proven novel gel treatments for production well water control, 15:27547 (RA;US)
Swelling equilibria for ionized temperature-sensitive gels in water and in aqueous salt solutions, 15:28588 (J;US)

GENERAL CIRCULATION MODELS
GCM [general circulation model] predictions for surface air temperature and precipitation over the southeastern United States, 15:29028 (R;US)

GENERAL RELATIVITY THEORY
Solved and unsolved problems in the stochastic quantization of gravity, 15:29609 (R;AT)

GENERATORS (ELECTRIC)
See ELECTRIC GENERATORS

GENERATORS (PULSE)
See PULSE GENERATORS

GENERATORS (STEAM)
See STEAM GENERATORS

GENETIC MAPPING
Design of oligonucleotides which attack specific gene targets. Annual report, December 1988-November 1989, 15:29132 (R;US)

GEOCHEMICAL SURVEYS
Reconnaissance geochemical survey for uranium and related industrial minerals in Cebu Island, 15:27656 (R;PH)

GEOCHEMISTRY
Geochemical modeling of radioactive waste glass dissolution using EQ3/6: Preliminary results and data needs, 15:27735 (R;US)

GEOLOGIC FRACTURES
Effects of single fractures on seismic wave propagation, 15:27529 (R;US)
Hydro-thermo-mechanical response of a fractured rock block, 15:29266 (R;US)
In-situ fracture stiffness determination, 15:27697 (R;US)
Scale effects in the shear behavior of joints in welded tuff, 15:27731 (R;US)
Stripa Project: interim report on the rock sealing project (stage 1), 15:29275 (R;CH)
Studies of computational models for jointed media with orthogonal sets of joints (Yucca Mountain Project), 15:27723 (R;US)
Surface roughness and the physical properties of fractures, 15:29276 (R;US)
The effects of tortuosity on flow through a natural fracture, 15:27530 (R;US)

GEOLOGIC STRUCTURES
See also GEOLOGIC FRACTURES
SEDIMENTARY BASINS
Bowen Basin - stress, structure and mining conditions: assessment for mine planning, 15:27467 (R;AU)

GEOMAGNETIC FIELD
Processing of DMSP magnetic data and its use in geomagnetic field modeling. Report for 1 October 1987-30 September 1989, 15:29335 (R;US)
Sunspots: Solar-terrestrial interactions. September 1972-January 1990 (A Bibliography from the International Aerospace Abstracts data base). Report for September 1972-January 1990, 15:29331 (R;US)

GEOTHERMAL ENERGY
Geothermal energy program summary: Volume 2, Research summaries, fiscal year 1989, 15:27870 (R;US)

GEOTHERMAL ENERGY CONVERSION
Geothermal energy program summary: Volume 1, Overview, fiscal year 1989, 15:27873 (R;US)

GEOTHERMAL EXPLORATION
Recovery of geothermal energy from weak stones in rocks, stage 4, 15:27872 (R;SE;In Swedish)
GEOTHERMAL HEATING SYSTEMS
Geothermal energy program summary: Volume 2, Research summaries, fiscal year 1989, 15:27870 (R;US)
GEOTHERMAL POWER PLANTS
Geothermal energy program summary: Volume 1, Overview, fiscal year 1989, 15:27873 (R;US)
Geothermal energy program summary: Volume 2, Research summaries, fiscal year 1989, 15:27870 (R;US)
GEOTHERMAL RESOURCES
Recovery of geothermal energy from weak stones in rocks, stage 4, 15:27872 (R;SE;In Swedish)
GEOTHERMAL WELLS
Laboratory and field evaluation of a two-component polyurethane foam for lost circulation control, 15:27874 (R;US)
GERMAN FEDERAL REPUBLIC
See FEDERAL REPUBLIC OF GERMANY
GERMANES
See GERMANIUM HYDRIDES
GERMANIUM
The effect of deposition rate on the growth of epitaxial Ge on GaAs (100), 15:28582 (J;US)
GERMANIUM ALLOYS
Superconducting thin films, composites, and junctions. Interim report, 1 October 1984-31 March 1985, 15:28369 (R;US)
Vibrational localization and vibrational spectra in amorphous silicon, 15:28428 (BA;US)
GERMANIUM HYDRIDES
Photoionization studies of GeH_n (n=2–4), 15:28660 (J;US)
Theoretical study of GeH_n, AsH_n, and SeH_n: Bond dissociation energies, 15:28661 (J;US)
GERMANY (FEDERAL REPUBLIC)

GIBBS FREE ENERGY
See FREE ENTHALPY
GINZBURG-LANDAU THEORY
A virial theorem and the method of simulated annealing in the Ginzburg-Landau theory, 15:29595 (BA;US)
GLASS
See also BOROSILICATE GLASS
PHOSPHATE GLASS
An assessment of glass microspheres for use as number-based aerodynamic size standards, 15:28528 (R;GB)
Brillouin gain spectroscopy in glasses and crystals, 15:29583 (R;US)
Development of a process control sensor for the glass industry: A status report, 15:28931 (R;US)
High resolution stimulated Raman-Brillouin spectroscopy in gases and solids, 15:29357 (R;US)
GLASS INDUSTRY
Reduction of environmental pollution by the lead glass industry of the Federal Republic of Germany, 15:28304 (RA;FI)
GLASS SCINTILLATORS
[Assembly of phototubes to lead-glass detectors]: Foreign trip report, March 5–April 3, 1990, 15:28913 (R;US)
GLASSY METALS
See METALLIC GLASSES
GLUCOSE
3H nuclear magnetic resonance study of anaerobic glycolysis in packed erythrocytes, 15:29133 (J;US)
GLUEBALLS
Scalar and tensor meson spectroscopy at a τ-charm factory, 15:29433 (RA;US)
GLUONIUM
See GLUEBALLS
GLUONS
Tasks in η_c physics, 15:29432 (RA;US)
GLYCINE HISPIDA
Responses to heat shock, arsenite and cadmium in soybean, 15:29253 (J;US)
GNEISSES
Inverse modeling of Chalk River block.: HYDROCOIN - level 2/case 3, level 3/case 5a, 15:29273 (R;CH)
GOBAR GAS
See METHANE
GOETHITE
Application of surface complexation models for radionuclide adsorption: Sensitivity analysis of model input parameters, 15:27703 (R;US)
GOLD
810 Future plans, 15:29517 (R;US)
Atomistic studies of interfacial structure and properties, 15:28433 (BA;US)
Deuterium permeability in gold determined using ion beams, 15:28450 (J;US)
Electronic structure of clusters and their reactivities, 15:28374 (RA;US)
The embedded atom method: Theory and application, 15:28416 (BA;US)
GOLD 197 TARGET
AGS silicon gold collisions measured in the E-810 TPC [Time Projection Chamber], 15:29538 (R;US)
GOLD COMPLEXES
Late transition metal μ-oxo and μ-imido complexes: Progress report, May 15, 1989–May 14, 1990, 15:28644 (R;US)
GRAIN ALCOHOL
See ETHANOL
GRANTS
ICP [Institutional Conservation Program] monitoring: Final report, 15:28167 (R;US)
Research and development of models and instruments to define, measure, and improve shared information processing within government oversight agencies: Volume 1, 4th annual performance report: research status, August 1989–July 1990, 15:29931 (R;US)
GRANULAR MATERIALS
Towards a constitutive model for cemented granular materials, 15:28554 (R;US)
GRAPHITE
A semi-empirical potential for graphite, 15:28558 (BA;US)
Performance of carbon as vacuum material and its degassing rate, 15:28537 (RA;JP;In Japanese)
GRAPHITE MODERATED REACTORS
Compact nuclear power source critical experiments and analysis, 15:28087 (J;US)
GRAPHITE MODERATOR
See GRAPHITE
GRASS
Recent increases in Bromus populations on the Nevada Test Site, 15:29171 (R;US)
Recirculation of process water in two-stage digestion, 15:27819 (RA;SE;In Swedish)
GRATINGS
A high efficiency diffraction grating design for a rhomb configuration, 15:28770 (BA;US)
Application of multilayer structures to the determination of optical constants in the x-ray, soft x-ray and extreme ultra violet spectral ranges, 15:28612 (BA;US)
Equivalence of focusing conditions for holographic and varied line-space grating systems, 15:28940 (J;US)
GRAVITATIONAL FIELDS
Superconducting gravity gradiometer mission. Volume 1: Study team executive summary, 15:28955 (R;US)
Teichmueller motion of (2+1)-dimensional gravity with the cosmological constant, 15:29332 (R;JP)
GREAT BRITAIN
See UNITED KINGDOM
GREENHOUSE EFFECT
Global and hemispheric annual temperature variations between 1861 and 1988, 15:28997 (R;US)
Solving global environmental problems through technological innovation, 15:28984 (R;US)
GREENHOUSES
Energy in greenhouses, 15:28296 (RA;CA)

Planning aids for the use of electric appliances in greenhouse horticulture, 15:28284 (R;DE;In German)

See HDR REACTOR

GROUND SOURCE HEAT PUMPS
Field test of direct expansion ground-source heat pumps for heating and cooling applications in single family homes: Final report, 15:28265 (R;SE)

GROUND SUBSIDENCE
Subsidence monitoring using seismic activity. Final report, 15:27480 (R;US)

GROUND WATER
Contamination
Advances in surface-enhanced Raman spectroscopy for applications in real-time subsurface monitoring, 15:28928 (R;US)
Cooperative LLNL/HAZWRAP project to demonstrate determination of field-based retardation factors: Part 2, Determination of sorption constants, 15:29105 (R;US)
Cooperative LLNL/HAZWRAP project to demonstrate determination of field-based retardation factors: Part 1, Distribution of perchloroethylene around and within permeable zones in saturated alluvial deposits, 15:29106 (R;US)
DUVAS [derivative ultraviolet absorption spectrometry] fiberscope for in situ groundwater monitoring, 15:29065 (R;US)
Evaluation of four well-casing materials for monitoring selected trace-level organics in ground water, 15:29064 (R;US)
Experimental verification of multicomponent ground water contamination predictions, 15:29109 (J;US)
Ground water monitoring strategies at the Weldon Spring Site, Weldon Spring, Missouri, 15:27764 (BA;US)
Handbook of suggested practices for the design and installation of ground-water monitoring wells. Final report, June 1985-July 1989, 15:29083 (R;US)
Installation-restoration Program, Phase 2. Confirmation/quantification, Stage 1. Kalispell Air Force Station, Montana. Final report, October 1986-March 1989, 15:27562 (R;US)
Superfund Record of Decision (EPA Region 1): Kellogg-Deering Well Field, Norwalk, CT. (Second Remedial Action), September 1989, 15:29076 (R;US)
Superfund Record of Decision (EPA Region 1): O'Connor Company Site, ME. (First Remedial Action), September 1989. Final report, 15:27567 (R;US)
Superfund Record of Decision (EPA Region 1): South Municipal Water Supply Well, BH. (First remedial action), September 1989, 15:29093 (R;US)
Superfund Record of Decision (EPA Region 1): W. R. Grace Acton, Massachusetts (First remedial action), September 1989, 15:29095 (R;US)
Superfund Record of Decision (EPA Region 2): Chemical Insecticide, Middlesex County, NJ. (First Remedial Action), September 1989, 15:29074 (R;US)
Superfund Record of Decision (EPA Region 2): Ewan Property, NJ. (Second Remedial Action), September 1989. Final report, 15:29072 (R;US)
Superfund Record of Decision (EPA Region 2): Port Washington Landfill, Nassau County, NY. (First Remedial Action), September 1989. Final report, 15:29075 (R;US)
Superfund Record of Decision (EPA Region 3): Cryochem, Berks County, PA (First remedial action), September 1989, 15:29091 (R;US)
Superfund Record of Decision (EPA Region 5): Alsco Anaconda, OH. (First remedial action), September 1989, 15:29094 (R;US)
Superfund Record of Decision (EPA Region 5): Cliff/Dow Dump, Marquette, MI. (First remedial action), September 1989. Final report, 15:27463 (R;US)
Superfund Record of Decision (EPA Region 5): Hedblum Industries, MI. (First remedial action), September 1989. Final report, 15:29092 (R;US)
Superfund Record of Decision (EPA Region 5): Rose Township Cemetery Dump Site, Oakland County, Michigan. (Second remedial action), September 1989. Final report, 15:29051 (R;US)
Superfund Record of Decision (EPA Region 5): Wausau Water Supply, Wisconsin. (Second remedial action), September 1989. Final report, 15:27571 (R;US)
Superfund Record of Decision (EPA Region 7): Chemplex, Clinton, IA. (First remedial action), September 1989, 15:29089 (R;US)
Superfund Record of Decision (EPA Region 7): Doepke Disposal (Holliday), KS. (First remedial action), September 1989. Final report, 15:29090 (R;US)
Superfund Record of Decision (EPA Region 8): Burlington Northern (Somerset Plant), Somers, MT. (First remedial action), September 1989. Final report, 15:27464 (R;US)
Technologies of delivery or recovery for the remediation of hazardous-waste sites, 15:29050 (R;US)

Decontamination
Bioremediation of contaminated surface soils, 15:29246 (R;US)

Flow Models
Evaluation of closure capping on groundwater flow and solute transport at the General Separations Area: Flow model and particle-tracking analysis of closure caps with runoff, 15:27745 (R;US)
Groundwater parameters and flow systems near Oak Ridge National Laboratory, 15:29071 (R;US)
Laboratory research program to aid in developing and testing the validity of conceptual models for flow and transport through unsaturated porous media, 15:27732 (R;US)

Fluid Flow
Water-table elevations on the Hanford Site, June 1989, 15:27713 (R;US)

Monitoring
Monitoring and sampling perched ground water in a basaltic terrain, 15:27685 (R;US)
RCRA [Resource Conservation and Recovery Act] groundwater monitoring projects for Hanford facilities: Annual progress report for 1989, 15:27714 (R;US)
Resource Conservation and Recovery Act ground-water monitoring projects for Hanford facilities: Progress report for the period October 1 to December 31, 1989: Volume 1, Text, 15:27715 (R;US)
Resource Conservation and Recovery Act ground-water monitoring projects for Hanford Facilities: Progress report, October 1–December 31, 1989: Volume 2, Appendixes, 15:27716 (R;US)

Pollutants
Petroleum contaminated soils. Volume 2, 15:27573 (B;US)

Radionuclide Migration
Monitoring and sampling perched ground water in a basaltic terrain, 15:27685 (R;US)

Remedial Action
USATHAMA [US Army Toxic and Hazardous Materials Agency] installation restoration program research and development strategies, 15:29044 (R;US)

SOLAR HEATING SYSTEMS
Alternative venting methods for residential oil heating systems, 15:29031 (B;US)
Cogeneration and gas-cooling research status report, 1984-85, 15:28254 (R;US)
Determination and validation of the energy consumption of heating and HVAC systems by means of computer-controlled operational simulation. German contribution to IEA Annex 10, 15:28247 (R;DE;In German)
Heat Pump and Appliance Research: Research status report 1985-1986, 15:28255 (R;US)
Heat Pump and Appliance Research: Status report 1984-1985, 15:28257 (R;US)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Woellstein, 15:28245 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of three solar houses in Landstuhl with identical floor plans, 15:28241 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Altenstadt, 15:28242 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Homburg, 15:28236 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Altenstadt, 15:28242 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Issum, 15:28243 (R;DE;In German)
Production of soot by oil fired domestic heat equipment, 15:28274 (B;US)

HEAVY ION FUSION REACTIONS
Non-equilbrium behavior of low-pressure plasma jets, 15:29842 (BA;US)
Study of nuclei far from stability with exotic nuclear beams, 15:29564 (BA;US)
Ře analysis and propagation direction sensitivity of HIBP data from TEXT, 15:29768 (BA;US)

HEAVY ION REACTIONS
See also CARBON 12 REACTIONS
DEEP INELASTIC HEAVY ION REACTIONS
NICKEL 58 REACTIONS
NITROGEN 15 REACTIONS
ZIRCONIUM 96 REACTIONS
Origin of complex fragments in intermediate energy heavy ion reactions, 15:29565 (BA;US)

HEAVY OILS

An assessment of second-generation stretched-membrane mirror modules, 15:27859 (R;US)

HELIOTRON
Design study of ion temperature measurement by collective Thomson scattering in Heliotron E, 15:29672 (R;JP)
Equilibrium, stability, and deeply trapped particle orbit calculations for l = 2 torsatron/heliotron configurations, 15:29675 (R;JP)
Magnetic field near plasma boundary in toroidal helical systems, 15:29808 (R;JP)
Parametric scaling studies of energy-confinement time for neutral-beam-heated Heliotron-E plasmas, 15:29673 (R;JP)
Recent activity on Heliotron E physics study and engineering developments, 15:29807 (R;JP)
Scalings of energy confinement and density limit in stellarator/heliotron, 15:29674 (R;JP)
Third harmonic electron cyclotron heating of overdense plasmas in Heliotron DR, 15:29676 (R;JP)

HELIUM
Excited state of He_4 molecule, 15:29354 (RA;JP;In Japanese)
Helium release from aged palladium tritide, 15:28516 (J;US)
Labarge liquid helium plant, 15:28818 (BA;US)

Merged-beam studies into the mechanisms of hydrogen molecular ion recombination. Final report, 1 September 1987-31 August 1989, 15:29343 (R;CA)

HELIUM 3

Analysis of the financial factors governing the profitability of lunar helium-3, 15:27789 (RA;US)
Importance of helium-3 for the future, 15:27790 (RA;US)
Report of NASA Lunar Energy Enterprise Case Study Task Force, 15:27787 (R;US)
Report of the NASA lunar energy enterprise case study task force, 15:27788 (RA;US)
The effects of charge dependence and asymmetry of nuclear forces on the mass difference of ^{3}H and ^{3}He, 15:29353 (RA;JP)

HELIUM 4

Structure of the $_{\Sigma}{}^{4}$He hypernuclear bound state, 15:29522 (RA;JP;In Japanese)

HELIUM COOLED REACTORS

See also HTTR REACTOR
Pressure drop measurements on supercritical helium cooled cable in conduit conductors, 15:28781 (J;US)

HERA STORAGE RING

Industrial experience on the HERA accelerator at DESY, 15:28832 (BA;US)
Industrial production of HERA superconducting dipoles, 15:28830 (BA;US)
Review on the industrial fabrication of the superconducting HERA quadrupole coils, 15:28821 (BA;US)
S.C. magnet fabrication at Ansaldo, 15:28834 (BA;US)
Series production of the first 20 superconducting HERA dipole magnets at ABB, 15:28833 (BA;US)

HERBS

Isolation of Arabidopsis mutants with altered seed fatty acid composition, 15:29153 (J;US)
Patterns of leaf and flower removal: Their effect on fruit growth in Chamaenerion angustifolium (fireweed), 15:29060 (J;US)
Regulation of poly(gamma-glutamycysteinyl)glycine synthesis, 15:29254 (J;US)

HETEROGENEOUS CATALYSIS

A spectroscopic and catalytic investigation of active phase-support interactions, 15:28480 (RA;US)
A study of catalysts and mechanisms in synthesis reaction, 15:28624 (RA;US)
Acid/base and redox reactions over oxide catalysts, 15:28619 (RA;US)
Activation and decomposition of alkanes on group VIII transition metal surfaces: dynamics, kinetics and spectroscopy, 15:28637 (RA;US)
Carbon deposition and deactivation of metallic catalysts, 15:28373 (RA;US)
Catalytic chemistry in supercritical media, 15:28628 (RA;US)
Catalytic hydrogenation of carbon monoxide, 15:28616 (RA;US)
Catalytic steam gasification of carbon: Research on tungsten carbide catalysts with high surface area, 15:28470 (RA;US)
Chemical activation of molecules by metals: Experimental studies of electron distributions and bonding, 15:28623 (RA;US)
Chemical interactions in multimetal/zeolite catalysts, 15:28630 (RA;US)
Chemistry of bimetallic and alloy surfaces, 15:28385 (RA;US)
Correlations between surface structure and catalytic activity/selectivity, 15:28379 (RA;US)
Dynamics of desorption from surfaces, 15:28620 (RA;US)
Effects of dispersion and support on adsorption, catalytic and electronic properties of cobalt/alumina CO hydrogenation catalysts, 15:28376 (RA;US)
Electronic structure of clusters and their reactivities, 15:28374 (RA;US)
Enhancement of activity and selectivity by metal-support interactions, 15:28636 (RA;US)
Fundamental investigations of supported metal catalysts, 15:28621 (RA;US)
Heterogeneous catalysis related to energy systems, 15:28384 (RA;US)
High pressure heterogeneous catalysis in a low pressure, ultra-high vacuum environment, 15:28618 (RA;US)
Homogeneous-heterogeneous combustion: Thermal and chemical coupling, 15:28686 (RA;US)
Infrared study of carbon deposits on bimetallic catalysts, 15:28473 (RA;US)
Interaction of carbon and sulfur on metal catalysts, 15:28627 (RA;US)
Interaction of molecules with surfaces, 15:28381 (RA;US)
Kinetic and spectroscopic characterization of metal oxide and sulfide catalysts, 15:28631 (RA;US)
Laser studies of chemical dynamics at the gas - surface interface, 15:28617 (RA;US)
Mechanisms and controlling characteristics of the catalytic oxidation of methane, 15:28685 (RA;US)
Metal-support bonds in supported metal catalysts, 15:28475 (RA;US)
Model Cu/ZnO catalysts for methanol synthesis: The role of surface structure, 15:28472 (RA;US)
Model catalyst studies of active sites and metal/support interactions on vanadia and vanadia-supported catalysts, 15:28482 (RA;US)
Model catalytic oxidation studies using supported monometallic and heterobimetallic oxides, 15:28474 (RA;US)
Model heteroatom removal reactions on molybdenum, 15:28378 (RA;US)
Molecular structure and chemical reactivity on surfaces, 15:28383 (RA;US)
Molecular surface science and its application to heterogeneous catalysis and coatings, 15:28634 (RA;US)
Morphological aspects of surface reactions, 15:28639 (RA;US)
Nuclear magnetic resonance in solids, 15:28633 (RA;US)
Optical studies of molecular adsorbates, 15:28382 (RA;US)
Project summary, 15:28476 (RA;US)
Reactive characterization as a probe of the nature of catalytic sites, 15:28471 (RA;US)
Research summary, 15:28377 (RA;US)
Selectivity of the reactions of oxygenates on transition metal surfaces, 15:28375 (RA;US)
Solid state, surface and catalytic studies of oxides, 15:28622 (RA;US)
Some fundamental aspects of zeolite catalysis, 15:28479 (RA;US)
Structural and electronic properties of iron and cobalt molecular sieve catalysts, 15:28635 (RA;US)
Structure and reactivity of model thin film catalysts, 15:28625 (RA;US)
Structures of transition metal hydrides, 15:28484 (RA;US)
Studies of supported hydrodesulfurization catalysts, 15:28483 (RA;US)
Support effects studied on model supported catalysts, 15:28478 (RA;US)
Surface analyses and modeling of rate multiplicity and instabilities, 15:28380 (RA;US)
Surface studies of ceramics using microbeam methods, 15:28481 (RA;US)
Systematic preparation of selective heterogeneous catalysts, 15:28469 (RA;US)
The chemistry and physics of transition metal clusters, 15:28629 (RA;US)
The dynamics of non-dissociative and dissociative adsorption on Pt(111), 15:28626 (RA;US)
The effect of catalyst preparation on catalytic activity, 15:28632 (RA;US)
The formation of supported bimetallic clusters: The effect of support - Metal precursor interactions, 15:28477 (RA;US)
Theoretical studies of chemisorption and surface reactions on nickel and silicon, 15:28640 (RA;US)
Theory of the dissociation dynamics of small molecules on metal surfaces: Finite temperature studies, 15:28638 (RA;US)
Vibrational spectroscopic studies of surface chemical interactions in chemisorption and catalysis, 15:28641 (RA;US)

HETEROJUNCTIONS

Characteristics of GaAs heterojunction FETs (HFETs) and source follower FET logic (SFFL) inverters exoposed to high energy neutrons, 15:28927 (J;US)

HEXADECANE
Hydrous pyrolysis of alkanes, alkenes, alcohols and ethers, 15:27578 (J;GB)
HFIR REACTOR
Thermal hydraulic system simulation of the HFIR with RELAP5/MOD2, 15:28060 (R;US)
HIGGS MODEL
A model for a dia-electric, 15:29611 (R;AT)
HIGH ENERGY PHYSICS
Proceedings of the symposium on networking, 15:29894 (R;JP)
HIGH ENERGY RADIOTHERAPY
See RADIOTHERAPY
HIGH EXPLOSIVES
See CHEMICAL EXPLOSIVES
HIGH FLUX ISOTOPE REACTOR
See HFIR REACTOR
HIGH FLUX NEUTRON SOURCE FACILITY
See NEUTRON SOURCE FACILITIES
HIGH PRESSURE
Release of alkali metals in pressurised fluidised-bed combustion and gasification of peat, 15:27506 (R;FI)
The development project for a dual-fuel gas-diesel power plant; Part II, 15:28700 (R;FI;In Finnish)
HIGH TEMPERATURE
Chemical composition and combustion properties of black liquor, 15:28310 (R;FI;In Finnish)
Trace elements removal from hot flue gases, 15:29030 (R;FI)
HIGH-BETA PLASMA
Global resistance MHD calculations for high-beta DIII-D divertor tokamak, 15:29833 (BA;US)
HIGH-FREQUENCY DISCHARGES
Substrate temperature distribution in microwave plasma used for polymer deposition, 15:29646 (RA;CS)
Synthesis of ultrafine powders by an inductively coupled plasma, 15:28489 (RA;CS)
The spectroscopic study of $SiCl_4$ in 400 kHz low pressure plasma etch reactor, 15:29645 (RA;CS)
HIGH-LEVEL RADIOACTIVE WASTES
Leaching
On the chemical behaviour of technetium during treatment of high-level radioactive waste, 15:27694 (R;DE;In German)
Radioactive Waste Disposal
Acceptance of failed SNF [spent nuclear fuel] assemblies by the Federal Waste Management System, 15:27706 (R;US)
Investigation of an empirical creep law for rock salt that uses reduced elastic moduli, 15:27730 (R;US)
Radioactive Waste Processing
Population and worker exposure from high-level waste production and management, 15:27754 (BA;US)
Radioactive Waste Storage
Accident analysis, nitrogen supply and purge systems: In-Tank Precipitation process, Savannah River Site, 15:27746 (R;US)
Solidification
Lead-iron phosophate glass, 15:27752 (BA;US)
Technetium Oxides
On the chemical behaviour of technetium during treatment of high-level radioactive waste, 15:27694 (R;DE;In German)
Transport
The influence of large, cold objects on engulfing fire environments, 15:27727 (R;US)
Underground Disposal
Analysis of WIPP [Waste Isolation Pilot Plant] disposal room and entryway drift intersection, 15:27729 (R;US)
Application of models for jointed rock to the analysis of prototype testing for the Yucca Mountain Project, 15:27726 (R;US)
Comparison of calculations and in situ results for a large, heated test room at the Waste Isolation Pilot Plant (WIPP), 15:27728 (R;US)
Exploratory shaft facility: It's role in the characterization of the Yucca Mountain site for a potential nuclear repository, 15:27695 (R;US)
G-Tunnel welded tuff mining experiment data summary: Yucca Mountain Project, 15:27722 (R;US)
Numerical analyses of the G-tunnel mining evaluations experiment (Yucca Mountain Project), 15:27724 (R;US)
Progress report on safety research of high-level waste management for the period April 1988 to March 1989, 15:27759 (R;JP)
Scale effects in the shear behavior of joints in welded tuff, 15:27731 (R;US)
Studies of computational models for jointed media with orthogonal sets of joints (Yucca Mountain Project), 15:27723 (R;US)
The effects of shear and normal stress paths on rock friction, 15:27733 (R;US)
Vitrification
Defense waste tank storage at the Hanford Site, 15:27742 (R;US)
Hanford waste vitrification plant project plant acquisition plan, 15:27744 (R;US)
On the chemical behaviour of technetium during treatment of high-level radioactive waste, 15:27694 (R;DE;In German)
HIGH-TC SUPERCONDUCTORS
In-situ processing of epitaxial and textured high $T_c$superconducting $HoBa_2Cu_3O_{7-x}$ thin films by pulsed laser evaporation technique, 15:28467 (R;US)
Pulsed-laser deposition of high-t_c superconducting thin films. Final technical report, 15 November 1988-15 October 1989, 15:28458 (R;US)
Search for far-infrared radiation from optically pumped defect modes. Final report, 15 June 1986-30 September 1989, 15:28463 (R;US)
Superconducting and semiconducting thin films of La_{123} and Y_{123} and their superlattices, 15:28466 (R;US)
HIGHWAYS
See ROADS
HILBERT SPACE
A generalized complementarity problem in Hilbert space, 15:29911 (R;US)
HOG FUEL
See WOOD WASTES
HOLMIUM OXIDES
In-situ processing of epitaxial and textured high $T_c$superconducting $HoBa_2Cu_3O_{7-x}$ thin films by pulsed laser evaporation technique, 15:28467 (R;US)
Magnetization of grain-aligned $HoBa_2Cu_3O_7 - \delta$, 15:28513 (BA;US)
HOLOGRAPHY
Equivalence of focusing conditions for holographic and varied line-space grating systems, 15:28940 (J;US)
Isoplanatic systems in mesooptics, 15:28895 (R;SU)
HOPPERS
Feeding of coal from mass-flow hopper outlets, 15:27484 (R;AU)
HORDEUM
See BARLEY
HORIZONTAL AXIS TURBINES
An experimental investigation of flap-wise blade-root load spectra for fatigue lifetime estimation, 15:27885 (RA;DK)
An intercomparison of models for wind flow in complex terrain and data from the Blashaval experiment, 15:27886 (RA;DK)
Function testing of the test turbine on The Test Station for Wind Turbines, 15:27882 (R;DK;In Danish)
Optimization of power output from wind turbines, 15:27887 (RA;DK)
Visualization of flow through a stall-regulated wind turbine rotor, 15:27890 (RA;DK)
HOSPITALS
Control technology for ethylene oxide sterilization in hospitals, 15:29247 (R;US)
HOT CELLS
Friction welded closures of waste canisters, 15:27751 (BA;US)
HOT GAS CLEANUP
Copper-based sorbents for hot gas cleanup, 15:27422 (RA;US)
HOT PLASMA
Calculations of soft X-ray emission of REB-heated plasma, 15:29635 (R;CS)
Control of plasma position in the CASTOR tokamak, 15:29632 (R;CS)

Effects of autoionizing resonances on density-sensitive spectral-line intensity ratios in high-temperature plasmas, 15:29789 (J;US)

HOT WATER
District heating in Saarijaervi, 15:28318 (RA;FI;In Finnish)

HOT-DRY-ROCK SYSTEMS
The pressure dilation of a deep, jointed region of the earth, 15:27875 (R;US)

HOUSEHOLDS
Substitution of hazardous materials in household and industrial products, 15:28341 (RA;FI)

HOUSES

Air Pollution Monitoring
The production of mutagens in cooked foods, 15:29250 (B;US)

Automation
Home automation: What's in it for utilities?: Final report, 15:28193 (R;US)

Energy Conservation
Efficient electric systems in small houses, 15:28263 (R;SE;In Swedish)
Energy savings and performance of an improved energy efficiency measure selection technique, 15:28227 (R;US)
Green solar architecture. Results of measurements and energy analysis of two solar houses in Tuebingen, 15:27866 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Darmstadt, 15:27865 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Issum, 15:28243 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Holzkirchen, 15:28237 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Homburg, 15:28236 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Altenstadt, 15:28242 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Woellstein, 15:28245 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Waldmoor, 15:28239 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the conventionally built reference house near Holzkirchen, 15:28238 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Ingelheim, 15:28244 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of three solar houses in Landstuhl with identical floor plans, 15:28241 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Landstuhl, 15:28235 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private houses - results of measurements and energy analysis of five solar houses with identical floor plans in Landstuhl, 15:28240 (R;DE;In German)

Energy Consumption
Green solar architecture. Results of measurements and energy analysis of two solar houses in Tuebingen, 15:27866 (R,DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Darmstadt, 15:27865 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the conventional reference house in Zirndorf, 15:28246 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Zirndorf-Weiherhof, 15:27864 (R;DE;In German)

Energy Efficiency
Energy efficient retrofit, 15:28261 (R;CA)

Heating Systems
Alternative venting methods for residential oil heating systems, 15:29031 (B;US)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the conventionally built reference house near Holzkirchen, 15:28238 (R;DE;In German)

Indoor Air Pollution
Evaluation of radon reduction techniques in fourteen basement houses: Preliminary results, 15:29035 (B;US)

Manufacturing
Dealer participation in the Bonneville Power Administration manufactured housing Residential Construction Demonstration Project: Summary and findings, 15:28229 (R;US)

Passive Solar Heating Systems
Passive solar addition: Final report, 15:28250 (R;CA)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Issum, 15:28243 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Woellstein, 15:28245 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Waldmoor, 15:28239 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of three solar houses in Landstuhl with identical floor plans, 15:28241 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Homburg, 15:28236 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Altenstadt, 15:28242 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the conventional reference house in Zirndorf, 15:28246 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Ingelheim, 15:28244 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Holzkirchen, 15:28237 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private houses - results of measurements and energy analysis of five solar houses with identical floor plans in Landstuhl, 15:28240 (R;DE;In German)

Retrofitting
Energy efficient retrofit, 15:28261 (R;CA)
Passive solar addition: Final report, 15:28250 (R;CA)

Solar Architecture
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Landstuhl, 15:28235 (R;DE;In German)

Thermal Insulation
Radiant barrier field tests in army family housing units at Fort Benning, Georgia, 15:28226 (R;US)

HTO

HYDROGEN IODIDES
See HYDRIODIC ACID

HYDROGEN IONS
Analysis of electron-stimulated desorption of H^+ from W(100) based on measured time of flight, 15:29577 (RA;JP;In Japanese)
Merged-beam studies into the mechanisms of hydrogen molecular ion recombination. Final report, 1 September 1987-31 August 1989, 15:29343 (R;CA)
Rotational state distributions from vibrational autoionization of H_2 revisited, 15:29372 (J;US)
Surface production of ions. Final scientific report, 1 August 1986-30 September 1989, 15:29344 (R;US)

HYDROGEN PEROXIDE
Electrochemical detection and quantification of water-soluble oxidants in the atmosphere, 15:28995 (R;DE;In German)

HYDROGEN PRODUCTION
Hydrogen production with coal using a pulverization device, 15:27791 (P;US)

HYDROGEN SELENIDES
See SELENIUM HYDRIDES
HYDROGEN SULFIDES
An electrochemical Claus process for sulfur recovery, 15:28222 (J;US)
HYDROGEN-BASED ECONOMY
Hydrogen, a study of energy efficiencies, 15:27792 (R;SE;In Swedish)
HYDROGENASE
See HYDROGENASES
HYDROGENASES
Cyanide inactivation of hydrogenase from Azotobacter vinelandii, 15:29259 (J;US)
HYDROLOGY
Assessment of CREAMS [Chemicals, Runoff, and Erosion from Agricultural Management Systems] and ERHYM-II [Ekalaka Rangeland Hydrology and Yield Model] computer models for simulating soil water movement on the Idaho National Engineering Laboratory, 15:27677 (R;US)
Test plan for hydrologic modeling of protective barriers, 15:27712 (R;US)
HYDROXYBENZENE
See PHENOL
HYDROXYL IONS
See ANIONS
HYDROXYL RADICALS
Measurement of OH rotational temperatures in a flame using degenerate four-wave mixing, 15:28689 (J;US)
HYPERCUBE COMPUTERS
Distributed decomposition of block-angular linear programs on a Hypercube computer, 15:29857 (R;US)
HYPERFRAGMENTS
See HYPERNUCLEI
HYPERNUCLEI
Production and structure of light Σ hypernuclei: Summary of the few body XII invited talk, 15:29523 (RA;JP)
Structure of the $_{\Sigma}{}^{4}$He hypernuclear bound state, 15:29522 (RA;JP;In Japanese)

I-INOSITOL
See INOSITOL
ICE
Analysis of particulates of comet nucleus samples: Possible use of olivine as indicator phase, 15:29317 (RA;US)
ICF DEVICES
A fiber sensor neutron streak camera for ICF diagnostics, 15:29725 (BA;US)
Neutron diagnostics of compressed ICF targets, 15:29763 (BA;US)
ICR HEATING
Analysis of ICRF heating and current drive in ITER, 15:29802 (R;JP;In Japanese)
Development of fast-wave ICRF [ion cyclotron range of frequencies] current drive systems at ORNL, 15:29795 (R;US)
IDAHO NATIONAL ENGINEERING LABORATORY
Hazards assessment of the hazardous waste storage facility, 15:27688 (R;US)
Idaho National Engineering Laboratory annual report, 15:28149 (R;US)
Managing previously disposed waste to today's standards: The Idaho buried waste program, 15:27687 (R;US)
Regulatory controls on the hydrogeological characterization of a mixed waste disposal site, Radioactive Waste Management Complex, Idaho National Engineering Laboratory, 15:27686 (R;US)
Subsurface Disposal Area (SDA) waste identification (1952–1970 emphasis): Revision 1, 15:27689 (R;US)
IDENTIFICATION SYSTEMS
Applications of diffraction moire interferometry to the creation of unique identifying marks, 15:28929 (R;US)
ILLINOIS
See also CHICAGO
Activity of PCBs (polychlorinated biphenyls) in sediments and water from Lake Calumet and Waukegan Harbor, 15:29085 (R;US)
Research on improved and enhanced oil recovery in Illinois through reservoir characterization: Technical progress report, December 29, 1989–March 28, 1990, 15:27525 (R;US)
ILLUMINATION SYSTEMS
See LIGHTING SYSTEMS
IMAGE PROCESSING
An acousto-optic image correlator with a throughput rate of 1000 templates per second, 15:29909 (R;US)
Optical recognition of 3-D targets, 15:29918 (BA;US)
Parallel relaxation labelling for optic flow, 15:29902 (R;GB)
Quantitative multispectral imaging system, 15:28938 (BA;US)
SIMD parallel version of the GLS optic flow algorithm, 15:29901 (R;GB)
IMAGE SCANNERS
Circumvention of radiation-induced noise in CCD and CID imagers, 15:28926 (J;US)
Comparison of mechanical and electronic high-speed recording systems, 15:28939 (BA;US)
IMIDES
New flexible circuit material evaluation, 15:28751 (R;US)
IMPACT FUSION
Tests for cold fusion in electrochemically deuterized palladium, 15:29521 (R;JP)
IMPERFECTIONS
See DEFECTS
IMPERMEABLE DRY ROCK
See HOT-DRY-ROCK SYSTEMS
IMPROVEMENT RATIO
See FORMATION DAMAGE
IMPURITIES
Impurity transport in ATF [Advanced Toroidal Facility] and the effect of controlled impurity injection, 15:29625 (R;US)
Summary of IAEA technical committee meeting on impurity control, 15:29806 (R;JP)
INCIDENTS
See ACCIDENTS
INCINERATION
See COMBUSTION
INCINERATORS
Demonstration of a steam jet scrubber off-gas system and the burner efficiency of a mixed incinerator facility, 15:27750 (BA;US)
Getting energy from municipal solid waste off the ground: Breaking the financing barrier, 15:28335 (RA;CA)
Performance history of the WERF incinerator, 15:27749 (BA;US)
INCLUSION COMPLEXES
See CLATHRATES
INCOMPLETE FUSION REACTIONS
Origin of complex fragments in intermediate energy heavy ion reactions, 15:29565 (BA;US)
INCONEL 690
Effect of different thermal treatments on the corrosion resistance of alloy 690 tubing: Final report, 15:27999 (R;US)
INCONEL 718
Atom probe analysis of the compositions of γ' and γ'' intermetallic phases in nickel-based superalloy 718, 15:28387 (R;US)
Grain boundary intermetallic phases in alloy 718, 15:28386 (R;US)
The effect of argon on the metal vapor arc during vacuum arc remelting of Inconel 718, 15:28417 (BA;US)
INDICATOR SPECIES
See BIOLOGICAL INDICATORS

INDIUM
Measurement of atomic indium during metalorganic chemical vapor deposition, 15:29368 (J;US)
INDIUM ANTIMONIDES
Measurement of atomic indium during metalorganic chemical vapor deposition, 15:29368 (J;US)
INDIUM ARSENIDES
Photoluminescence studies of InGaAlAs quaternary alloys, 15:28426 (BA;US)
INDIUM COMPOUNDS
See also INDIUM ANTIMONIDES
INDIUM ARSENIDES
Measurement of atomic indium during metalorganic chemical vapor deposition, 15:29368 (J;US)
INDIUM PHOSPHIDE SOLAR CELLS
Radiation-hard high-efficiency InP space solar-cell development. Quarterly progress report for 12 August-11 November 1989, 15:27849 (R;US)
INDOOR AIR POLLUTION
Overview of indoor air quality sampling and analysis, 15:28276 (BA;US)
INDUSTRIAL PLANTS

Superfund Record of Decision (EPA Region 1): O'Connor Company Site, ME. (First Remedial Action), September 1989. Final report, 15:27567 (R;US)

MAINTENANCE
The profitability of energy conservation measures by building types, 15:28268 (R;FI;In Finnish)

MAIZE
A developmentally regulated hydroxyproline-rich glycoprotein in maize pericarp cell walls, 15:29160 (J;US)

MAKI PARAMETER
See GINZBURG-LANDAU THEORY

MALIGNANCIES
See NEOPLASMS

MAN
Preplacement testing pilot program, 15:28102 (R;US)

MAN-MACHINE SYSTEMS
Energy and Technology Review, January–February 1990, 15:29912 (R;US)

MANGANESE
Early inhibition of photosynthesis during development of Mn toxicity in tobacco, 15:29257 (J;US)

MANGANESE ALLOYS
Joint research centre fusion materials irradiations in HFR: present status and prospectives, 15:28397 (R;FR)

MANGANESE BORIDES
Metalloboranes as precursors to metallic glasses. Final report, 1 July 1986-30 September 1989, 15:28370 (R;US)

MANGANESE COMPLEXES
Ligand-centered oxidation of manganese(II) complexes, 15:28662 (J;US)

MANGANESE OXIDES
Copper-based sorbents for hot gas cleanup, 15:27422 (RA;US)
Reactive characterization as a probe of the nature of catalytic sites: Annual technical progress report, January 1989 to January 1990, 15:28643 (R;US)

MANIPULATORS
Dynamics analysis of robot manipulator: Computer simulation for two-linkage mechanism, 15:28702 (R;JP;In Japanese)
MANUALS
GUFDIPP - the GUERAP user-friendly data-input programme package for generating and modifying GUERAP III data-files, 15:28914 (R;GB)
MANUFACTURING FACILITIES
See INDUSTRIAL PLANTS
MANURES
Aeration as a means to preheating in a full-scale biogas plant, 15:27827 (RA;SE;In Swedish)
Anaerobic filters for agricultural energy plants and industrial waste water plants, 15:27824 (RA;SE;In Danish)
Animal hygienic aspects of operation of joint biogas plants, 15:27835 (RA;SE;In Danish)
MAPPING
See also GENETIC MAPPING
TOPOLOGICAL MAPPING
Pattern classification using self-organizing feature maps, 15:29934 (R;US)
MAPPING (TOPOLOGICAL)

MEDICAL ESTABLISHMENTS
See also HOSPITALS
Participation of SAIC (Science Applications International Corporation) in the LLUMC (Loma Linda University Medical Center) proton synchrotron project, 15:28802 (BA;US)

MEDICAL SUPPLIES
Hazard and operability study of an ethylene oxide sterilizer for National Institute for Occupational Safety and Health. Final report, 15:29248 (R;US)

MELAMINE
Melamine acrylates: An interesting class of oligomers, 15:28647 (R;AT)

MELANOCYTES
See ANIMAL CELLS

MELT REFINING PROCESS
See PYROCHEMICAL REPROCESSING

MEMBRANE TRANSPORT
The Sherman-Rinzel-Keizer model for bursting electrical activity in the pancreatic β-cell, 15:29131 (R;US)

MEMBRANES
ORGDP-1 - Development of ceramic membranes for gas separation, 15:27910 (RA;US)

MEMORY DEVICES
Radiation response of floating gate EEPROM memory cells, 15:28924 (J;US)

MERCURY
Mechanisms of cytoskeletal injury by heavy metals, 15:29245 (R;US)

MERCURY ISOTOPES
Superdeformation in the mercury nuclei, 15:29539 (R;US)

MERCURY TELLURIDES
The determination of the free energy of formation of binary tellurides using lithium coulometric titration techniques, 15:28522 (J;US)

MESH GENERATION
Generally configurable multigrid implementation for transputer networks, 15:29897 (R;GB)
Numerical algorithms for parallel computers. Final technical report, 1 May 1986-31 August 1989, 15:29863 (R;US)
Paving: A new approach to automated quadrilateral mesh generation, 15:29910 (R;US)

MESON FACTORIES
Proceedings of the workshop on asymmetric B factory at KEK, 15:29447 (R;JP;In Japanese)

MESON RESONANCES
See MESONS

MESON SPECTROSCOPY
Scalar and tensor meson spectroscopy at a τ-charm factory, 15:29433 (RA;US)

MESON-MESON INTERACTIONS
Pion-pion and pion-kaon interaction in the meson exchange picture, 15:29466 (R;DE;In German)

MESONS
See also BOTTOMONIUM
CHARMED MESONS
STRANGE MESONS
Investigation of the electromagnetic structure of η and η' mesons by two-photon interactions, 15:29452 (J;US)
Strangeonium spectroscopy at the J/ψ: A comparison with kaon hadroproduction, 15:29438 (RA;US)

METAL INDUSTRY
Outokumpu ferrochrome process, 15:28303 (RA;FI)
Outokumpu flash smelting - an efficient and non-polluting metallurgical process, 15:28302 (RA;FI)

METAL-NONMETAL BATTERIES
See also LITHIUM-SULFUR BATTERIES
Feasibility of a superhigh energy-density battery of the Li/BrF_3 electrochemical system. Technical report, 15:28107 (R;US)
Feasibility of a superhigh energy-density battery of the Li/BrF_3 electrochemical system. Progress report, 15 October-15 December 1989, 15:28106 (R;US)

METALLIC GLASSES
Metalloboranes as precursors to metallic glasses. Final report, 1 July 1986-30 September 1989, 15:28370 (R;US)

METALLOTHIONEIN
Mechanisms of cytoskeletal injury by heavy metals, 15:29245 (R;US)

METALLURGY
Metals research and development: Applications in the field of energy in Italy. Meeting organized by AIM (Italian Association of Metallurgy) and ENEA. Milan, 19-20 Oct 1988, 15:27941 (R;IT;In Italian)

MERCURY
RARE EARTHS
REFRACTORY METALS
ZINC
Differences between the atomic structures of grain boundaries in pure F.C.C. metals and Li_2 ordered compounds, 15:28425 (BA;US)
High-temperature behavior of grain boundaries from embedded atom method molecular dynamics simulation, 15:28431 (BA;US)
Method of producing non-agglomerating submicron size particles, 15:29590 (P;US)
Polymer bead containing immobilized metal extractant, 15:29111 (P;US)
Reaction at traps involving two diffusing species: Application to atomic–molecular hydrogen conversion at defects, 15:28664 (J;US)
Research summary, 15:28377 (RA;US)
Sampling and analytical procedures for the industrial-hygiene characterization of coal gasification and liquefaction pilot plants, 15:27518 (R;US)
Theory of the dissociation dynamics of small molecules on metal surfaces: Finite temperature studies, 15:28638 (RA;US)
Time dependence of trapping and detrapping of particles by saturable traps, 15:28663 (J;US)
Volatilisation and removal of trace metals at high temperatures, 15:29029 (RA;FI)

METEORITES
Isotopic microanalysis of returned comet nucleus samples, 15:29326 (RA;US)
The carbon chemistry of meteorites: Relationships to comets, 15:29291 (RA;US)

METER WAVE RADIATION
See RADIOWAVE RADIATION

METHANE
Biosynthesis
Anaerobic filters for agricultural energy plants and industrial waste water plants, 15:27824 (RA;SE;In Danish)
Characterization of biofilm community structure by ribosomal RNA sequences. Annual report, 1 December 1988-30 November 1989, 15:27802 (R;US)
Recirculation of process water in two-stage digestion, 15:27819 (RA;SE;In Swedish)
The microbiology of waste degradation in landfills, 15:27812 (RA;SE;In Swedish, English, Norwegian, Dan)
Use of a mass spectrometer for on-line measurement and control of thermophilic, anaerobic fermentation processes, 15:27816 (RA;SE;In Danish)
Boreholes
In seam and cross measure methane predrainage by long-hole drilling, 15:27472 (R;AU)
Chemical Preparation
Ferromagnetic behavior in linear charge-transfer complexes. Structural and magnetic characterization of octamethylferrocene salts: $[Fe(C_5Me_4H)_2]^{\bullet+}[A]^{\bullet-}$ (A = TCNE, TCNQ), 15:28668 (J;US)
Chemisorption
Activation and decomposition of alkanes on group VIII transition metal surfaces: dynamics, kinetics and spectroscopy, 15:28637 (RA;US)
Conversion
Direct conversion of methane to C_2 and liquid fuels - Chemistry, 15:27596 (RA;US)
Direct conversion of methane to C_2 and liquid fuels - Process economics, 15:27597 (RA;US)
Direct conversion of methane to higher hydrocarbons through oxidative coupling, 15:27599 (RA;US)
Natural gas to liquids conversion technology status - An overview, 15:27600 (RA;US)
Ecological Concentration
Superfund Record of Decision (EPA Region 2): Port Washington Landfill, Nassau County, NY. (First Remedial Action), September 1989. Final report, 15:29075 (R;US)
Emission
Emission of methane by the gas and oil producing industry in the Federal Republic of Germany in 1988, 15:27563 (R;DE;In German)
Emission of methane from petroleum refining and petroleum products storage and distribution in the Federal Republic of Germany in 1988, 15:27564 (R;DE;In German)
Flame Propagation
The influence of fluid motion on flame kernel development and cyclic variation in a spark ignition engine, 15:28347 (B;US)
Liquefaction
Natural gas to liquids conversion technology status - An overview, 15:27600 (RA;US)
Oxidation
Mechanisms and controlling characteristics of the catalytic oxidation of methane, 15:28685 (RA;US)
Oxidative coupling of methane on rare earth oxide catalysts, 15:27843 (R;FR;In French)
Partial Oxidation Processes
Partial oxidation reactions of methane and oxygen, 15:27595 (BA;US)
Processing
Direct conversion of methane to C_2 and liquid fuels - Chemistry, 15:27596 (RA;US)
Production
Development of a novel approach for coal bioconversion to alcohol fuels, 15:27425 (R;US)
Pressure monitoring and observed effects of mining at the Oak Grove, AL. Coalbed degasification pattern. Report of investigations/1989, 15:27433 (R;US)
Research Programs
GRI's (Gas Research Institute's) methane from Biomass and Wastes subprogram. Status report 1982, 15:27793 (R;US)
Resource Potential
Geological evolution and analysis of confirmed or suspected gas hydrate localities: Volume 15, Evaluation of geological relationships to gas hydrate formation and stability, Summary report: Final report, 15:27586 (R;US)
Solubility
Geological evolution and analysis of confirmed or suspected gas hydrate localities: Volume 15, Evaluation of geological relationships to gas hydrate formation and stability, Summary report: Final report, 15:27586 (R;US)
METHANE HYDRATES

MONOCARBOXYLIC ACIDS
See also ABSCISIC ACID
ACETIC ACID
Nuclear Medicine Program progress report for quarter ending December 31, 1989, 15:29142 (R;US)
MONOCHROMATORS
Multilayer monochromators for the soft x-ray and extreme ultraviolet, 15:28841 (BA;US)
MONTANA
Superfund Record of Decision (EPA Region 8): Burlington Northern (Somerset Plant), Somers, MT. (First remedial action), September 1989. Final report, 15:27464 (R;US)
MONTE CARLO METHOD
First wall system in the IGNITEX experiment, 15:29840 (BA;US)
Investigation of radiation effects in Hiroshima and Nagasaki using a general Monte Carlo-discrete ordinates coupling scheme, 15:29170 (R;US)
MOON
Lunar power system summary of studies for the lunar enterprise task force NASA-office of exploration, 15:27856 (RA;US)
The role of automation and robotics in the Lunar-Based Chemical Analysis Laboratory, 15:28697 (R;US)
MORTARS
Studies on diffusion of ^{137}Cs in cement mortar, 15:27692 (R;JP;In Japanese)
MOS TRANSISTORS
See also MOSFET
An improved standard total dose test for CMOS space electronics, 15:28923 (J;US)
CMOS VLSI single event transient characterization, 15:28925 (J;US)
Correlation between preirradiation 1/F noise and postirradiation oxide-trapped charge in MOS transistors, 15:28922 (J;US)
Irradiation effect of transistor by Co-60 gamma rays and electron beams: Effects of exposure rate and temperature, 15:28920 (R;JP;In Japanese)
MOSFET
A spin dependent recombination study of radiation induced defects at and near the Si/SiO_2 interface, 15:28921 (J;US)
MOUNTAINS
See also ALPS
YUCCA MOUNTAIN
An anomalous wind between valleys—its characteristics and a proposed explanation, 15:29268 (R;US)
MULLITE
Thermodynamic analysis of chemical stability of ceramic materials in hydrogen-containing atmospheres at high temperatures. Final report, 15:28493 (R;US)
MULTI-ELEMENT ANALYSIS
Investigations of fertilizer phosphates for minor and trace elements by means of instrumental neutron activation analysis (INAA), 15:28599 (R;DE;In German)
Nuclear analytical chemistry: Applications in industry and agriculture, 15:28608 (RA;ZA)

Nuclear analytical chemistry: Applications of the XSQR technique, 15:28609 (RA;ZA)

MULTIPHASE FLOW
Numerical and physical modelling of bubbly flow phenomena: Progress report, July 1, 1989–March 31, 1990, 15:28715 (R;US)

MULTIPROCESSING
See PARALLEL PROCESSING

MULTIPROCESSORS
See ARRAY PROCESSORS

MULTISPECTRAL SCANNERS
Quantitative multispectral imaging system, 15:28938 (BA;US)

MULTIWIRE DRIFT CHAMBERS

MUNICIPAL WASTES
Biodegradation
Field tests of enhanced degradation of household waste in a landfill, 15:27823 (RA;SE;In Swedish, English, Norwegian, Dan)
The microbiology of waste degradation in landfills, 15:27812 (RA;SE;In Swedish, English, Norwegian, Dan)

Combustion
Cofiring of pelletized refuse-derived fuel with coal to achieve sulfur dioxide emissions requirements, 15:27939 (J;US)
Economic impact of air-pollutant emission guidelines for existing municipal-waste combustors. Final report, 15:28326 (R;US)
Economic impact of air-pollutant emission standards for new municipal-waste combustors. Final report, 15:28327 (R;US)
Municipal waste combustion assessment: Fluidized bed combustion. Final report, October 1988-July 1989, 15:28332 (R;US)
Municipal waste combustors-background information for proposed standards: Post-combustion technology performance. Volume 3. Final report, 15:28323 (R;US)
Municipal-waste combustion assessment: Waste co-firing. Final report, October 1988-July 1989, 15:28331 (R;US)
Municipal-waste combustors - background information for proposed guidelines for existing facilities. Volume 5. Final report, 15:28325 (R;US)
Municipal-waste combustors - background information for proposed standards, 15:28320 (R;US)
Municipal-waste combustors - background information for proposed standards: 111(b) model plant description and cost report. Volume 2. Final report, 15:28322 (R;US)
Municipal-waste combustors - background information for proposed standards: Control of NOx emissions. Volume 4. Final report, 15:28324 (R;US)
Municipal-waste combustors - background information for proposed standards: cost procedures. Volume 1. Final report, 15:28321 (R;US)

Energy Conversion
Cofiring of pelletized refuse-derived fuel with coal to achieve sulfur dioxide emissions requirements, 15:27939 (J;US)

Energy Recovery
Case study: Modular controlled air incineration of municipal waste for energy recovery: The Prince Edward Island experience, 15:28333 (RA;CA)
Putting resource recovery into perspective, 15:28334 (RA;CA)

Resource Assessment
The biogas potential of organic wastes in Sweden, 15:27820 (RA;SE;In Swedish)

Waste Disposal
Proximity of New Jersey sanitary landfills to wetlands and deepwater habitats: Statewide results, 15:29099 (R;US)
Proximity of New Jersey sanitary landfills to wetlands and deepwater habitats: data on individual landfills, 15:29100 (R;US)
Superfund Record of Decision (EPA Region 1): Kellogg-Deering Well Field, Norwalk, CT. (Second Remedial Action), September 1989, 15:29076 (R;US)

Waste Management
Municipal solid-waste-management options, 15:28328 (R;US)
Municipal solid-waste-management options. Volume 4. Waste-to-energy, 15:28330 (R;US)

Waste Processing
Getting energy from municipal solid waste off the ground: Breaking the financing barrier, 15:28335 (RA;CA)

Waste Product Utilization
Biogas from kitchen wastes, 15:27838 (RA;SE;In Swedish)

Waste Transportation
Municipal solid-waste-management options. Volume 3. Transfer stations, 15:28329 (R;US)

MUONS
Improved limit on the branching ratio of $K^+ \rightarrow \pi^+ \mu^+ e^-$, 15:29451 (J;US)
Status of the top quark search at CDF, 15:29454 (J;US)

MURR REACTOR
University of Missouri Research Reactor (MURR) annual report, July 1988–June 1989: Annual report, July 1988–June 1989, 15:28023 (R;US)

MUTAGENS
The production of mutagens in cooked foods, 15:29250 (B;US)

MUTUALISM
See SYMBIOSIS

MX DEVICES
See MFTF DEVICES

MYCORRHIZAS
Investigations of the mycorrhiza reactions to ozone and acid mist, 15:29221 (RA;DE;In German)

N

N CODES
A radiation briefer's guide to the PIKE Model, 15:28988 (R;US)

N-REACTOR
An assessment of fission product chemical equilibrium for severe N Reactor accident conditions, 15:28018 (R;US)
Analysis of N Reactor anticipated transients without scram, 15:28079 (R;US)
CONTAIN analysis of an N Reactor severe accident with hydrogen mitigation, 15:28019 (R;US)
Correlations for fission product release from N Reactor fuel under high-temperature accident conditions, 15:28016 (R;US)
Emergency response guide-B ECCS guideline evaluation analyses for N reactor, 15:28050 (R;US)
Hydrogen generation and thermal analysis of the hydrogen-mitigation design-basis accident: N Reactor safety enhancement, Final report, 15:28078 (R;US)
N Reactor limited-scope probabilistic risk assessment, 15:28076 (R;US)
Oxidation of N Reactor fuel under high-temperature accident conditions, 15:28077 (R;US)
Project H-797, N Reactor 1312-N Liquid Effluent Retention Facility, reanalysis and documentation of design bases, 15:27743 (R;US)
Scoping analysis of fission product behavior and transport in the primary coolant system for postulated N Reactor severe accidents, 15:28017 (R;US)

NAC CYCLOTRON
Annual report June 1986, 15:28792 (R;ZA)
The 200 MeV cyclotron facility: The injector cyclotrons, 15:28861 (RA;ZA)
The Pretoria cyclotron facility: Cyclotron operation and development, 15:28873 (RA;ZA)
The Pretoria cyclotron facility: Production of radioisotopes, 15:28684 (RA;ZA)
The Pretoria cyclotron facility: Radiation physics, 15:29139 (RA;ZA)
The separated-sector cyclotron: Beam diagnostics, 15:28863 (RA;ZA)
The separated-sector cyclotron: Injection, 15:28862 (RA;ZA)
The separated-sector cyclotron: Orbit calculations, 15:28864 (RA;ZA)
The separated-sector cyclotron: Radio-frequency system, 15:28866 (RA;ZA)
The separated-sector cyclotron: Sector magnets, 15:28865 (RA;ZA)

The separated-sector cyclotron: Vacuum system, 15:28867 (RA;ZA)

NACSSC
See NAC CYCLOTRON

NAI DETECTORS
G(E) functions (spectrum-dose conversion operator) of 3"ϕ spherical NaI(Tl) scintillation detector for estimating effective dose equivalent, 15:28893 (R;JP;In Japanese)

NAL SYNCHROTRON
See FERMILAB ACCELERATOR

NAPHTHA
Fischer-Tropsch naphtha upgrading, 15:27556 (RA;US)

NAPHTHALENE
DUVAS [derivative ultraviolet absorption spectrometry] fiberscope for in situ groundwater monitoring, 15:29065 (R;US)

NATIONAL ACCELERATOR LABORATORY

Combustion
Combustion system technology and application assessment: Combustion control systems. Topical report, February 1989, 15:27644 (R;US)

Compressibility
Optimizing AGA-8, 15:27640 (RA;CA)

Conversion
C_1 catalysis at IGT (Institute of Gas Technology), 15:27598 (RA;US)

Energy Consumption
The energy supply in Finland in the 21st century, 15:28168 (RA;FI;In Finnish)

Energy Supplies
The long-term trends in US gas supply and prices: The 1989 GRI baseline projection of US energy supply and demand to 2010, 15:27610 (R;US)

Market
Competitive position of natural gas: Industrial drying. May 1988, 15:27611 (R;US)
High-temperature industrial process heating: Oxygen-gas combustion and plasma-heating systems. Topical report, 15:27615 (R;US)
Low-temperature industrial process heating: Radiant, pulse, and catalytic combustion systems. Topical report, 15:27616 (R;US)
Outlook for total energy and natural gas demand in the industrial sector. Topical report, 15:27612 (R;US)

Moisture
Latest technology in moisture measurement, 15:28949 (RA;CA)

Moisture Gages
Devices for moisture measurement in natural gas, 15:27638 (RA;CA)

Odorant Dispensers
Mathematical modelling of natural gas bypass odorizers, 15:27641 (RA;CA)

Performance
Direct gas injection with glow-plug ignition. Annual report, August 1988-July 1989, 15:28353 (R;US)

Prices
Future gas prices: Current trends and future factors, 15:28177 (RA;CA)
Natural gas markets in the 1990's: The perspective of an eastern distributor, 15:28178 (RA;CA)
Natural gas pricing outlook, 15:28181 (RA;CA)
Natural gas, an industry perspective, 15:28179 (RA;CA)

Processing
C_1 catalysis at IGT (Institute of Gas Technology), 15:27598 (RA;US)

Reformer Processes
High temperature ceramic-tubed reformer, 15:27842 (R;US)

Research Programs
Environment and Safety Research Program status report, 1984, 15:27582 (R;US)
Environment and Safety Research status report. 1985-1986, 15:27585 (R;US)
Environment and Safety research status report: 1984-1985, 15:27617 (R;US)
GRI (Gas Research Institute) Conservation Program: Status report, 15:27584 (R;US)
GRI (Gas Research Institute) basic research program area: Overview and status report, 15:27583 (R;US)
Gas Research Institute status report: Distribution and Storage (3.3) subprogram. 1984-85, 15:27634 (R;US)
Natural Gas Supply Subprogram. Status report, 1985, 15:27590 (R;US)
Research and development results for 1984, 15:27581 (R;US)
Tight gas sands research program: Field operations and analysis. Analysis of selected wells surrounding SFE No. 3, Waskom Cotton Valley Field, Harrison County, Texas. Topical report, 15:27592 (R;US)
Transport and Storage (3.3) Subprogram for Gas Research Institute: Status report, 1985, 15:27636 (R;US)

Reserves
Distribution of natural gas and reservoir properties in the continental crust of the United States. Final report, June 15, 1988-June 15, 1989, 15:27591 (R;US)
GRI's (Gas Research Institute's) Natural Gas Supply Subprogram status report, 1989, 15:27589 (R;US)

Safety
NVG [Natural Gas for Vehicles] metering, 15:28358 (RA;CA)

Sales
Natural gas, an industry perspective, 15:28179 (RA;CA)

Sampling
Composite sampling: Composite sampling to determine heating value and compositional analysis of a gas stream under investigation, 15:27643 (RA;CA)
Wet gas sampling and high BTU sampling, 15:27642 (RA;CA)

Supply and Demand
Baseline projection data book: 1988 GRI (Gas Research Institute) baseline projection of US energy supply and demand to 2010, 15:27613 (R;US)
Baseline projection data book: 1989 GRI (Gas Research Institute) baseline projection of US energy supply and demand to 2010, 15:28169 (R;US)
Natural gas pricing outlook, 15:28181 (RA;CA)
Policy implications of the GRI (Gas Research Institute) baseline projection of US energy supply and demand to 2010, 1989, 15:27614 (R;US)

Technology Assessment
NVG [Natural Gas for Vehicles] metering, 15:28358 (RA;CA)

NATURAL GAS APPLIANCES
See GAS APPLIANCES

NATURAL GAS DEPOSITS
Petrology of Devonian shales: Affects on natural gas production. Topical report, August 1989, 15:27588 (R;US)
Technical analysis and program management support of the tight gas sands project area. Annual report, November 1987-October 1988, 15:27587 (R;US)

NATURAL GAS DISTRIBUTION SYSTEMS
Review of automated custody transfer equipment for large-volume gas flow measurement. Final report, August 1, 1987-February 28, 1988, 15:27635 (R;US)

NATURAL GAS FUEL CELLS
Direct utilization of hydrocarbon fuels in high temperature solid oxide electrolyte fuel cells, 15:28220 (BA;US)

NATURAL GAS GATHERING SYSTEMS
See NATURAL GAS DISTRIBUTION SYSTEMS

NATURAL GAS INDUSTRY
ELSA a family of electronic correctors, 15:28950 (RA;CA)

Competition
Can a more competitive natural gas industry provide stability, 15:28187 (BA;US)

Electric Measuring Instruments
Mercury instruments electronic corrector, 15:27623 (RA;CA)

Metretek year two at Consumers Gas, 15:28947 (RA;CA)
Providing electronic volume signals to customers, 15:27601 (RA;CA)

Electronic Equipment
Electronic test equipment, 15:27629 (RA;CA)
Features of electronic correctors, 15:28944 (RA;CA)

Energy Audits
Audit procedures: Orifice metering, 15:27603 (RA;CA)

Energy Policy
Policy implications of the GRI (Gas Research Institute) baseline projection of US energy supply and demand to 2010, 1989, 15:27614 (R;US)

Engineered Safety Systems
Fundamentals of over-pressure protection, 15:27627 (RA;CA)

Environmental Impacts
Outer Continental Shelf oil and gas program: Cumulative effects, 15:27572 (R;US)

Forecasting
Interfuel competition, natural gas, 15:28174 (RA;CA)
Natural gas markets in the 1990's: The perspective of an eastern distributor, 15:28178 (RA;CA)
Natural gas pricing outlook, 15:28181 (RA;CA)
Natural gas, an industry perspective, 15:28179 (RA;CA)

Gas Meters
Application of PCs in meter proving, 15:27607 (RA;CA)
Fundamentals of diaphragm meters, 15:28948 (RA;CA)
Fundamentals of gas measurement: Overview of gas measurement covering types, operation, sizing and selection, 15:27620 (RA;CA)
Station design: An overview of the basics of meter station design, 15:27633 (RA;CA)

Gases
Moisture content: Policy, effects and operation, 15:27606 (RA;CA)

Leak Detectors
Gas detection - past and future, 15:27630 (RA;CA)

Measuring Instruments
Electronic volume intergrators at Union Gas, 15:28886 (RA;CA)

Meetings
Proceedings of the twenty-eighth annual gas measurement school, 15:27580 (R;CA)

Moisture
Moisture content: Policy, effects and operation, 15:27606 (RA;CA)

Planning
The Northern Illinois Alliance to Support Least-cost Utility Planning: Final report, September 1987–September 1989, 15:28123 (R;US)

Pneumatic Controllers
Fundamental priniciples of pilot operated regulators, 15:27622 (RA;CA)

Pressure Control
Fundamentals of over-pressure protection, 15:27627 (RA;CA)

Remote Multiplexing Systems
Fundamental of SCADA [Supervisory Control and Data Acquisition] systems, 15:28945 (RA;CA)

NATURAL GAS WELLS
A procedure for relative ranking of sites selected for horizontal wells in tight, naturally fractured reservoirs, 15:27594 (BA;US)

NATURAL LIGHTING
See DAYLIGHTING

NATURAL RADIOACTIVITY
Population exposure from natural sources and consumer products, 15:29036 (BA;US)

NATURE RESERVES
Monitoring of atmospheric particles and ozone in Sequoia National Park: 1985-1987. Final report, 15:29002 (R;US)

NAVAL OIL SHALE RESERVES
Naval Petroleum and Oil Shale Reserves FY 1989 annual report of operations, 15:27645 (R;US)

SOLID-STATE PLASMA
ASDEX contributions to the 8th international conference on plasma surface interaction in controlled fusion devices, Juelich, May 2-6, 1988 and international workshop on plasma edge theory, Augustusburg (GDR), April 26-30, 1988, 15:29653 (R;DE)
Anisotropic distribution function of minority tail ions generated by strong ion-cyclotron resonance heating, 15:29783 (J;US)
Auxiliary heated detached plasmas in tokamaks, 15:29782 (J;US)
Data acquisition and display in space plasma physics, 15:29702 (BA;US)
Detection limits in the measurement of alpha particles by CO_2 laser Thomson scattering, 15:29755 (BA;US)
Equation of state of the one-component plasma derived from precision Monte Carlo calculations, 15:29790 (J;US)
Microwave absorption diagnostics on the MTX Tokamak, 15:29770 (BA;US)
Microwave tokamak experiment (MTX) status and plans, 15:29767 (BA;US)
Ohmic and alpha heating in the high-field IGNITEX Tokamak, 15:29839 (BA;US)
Quasineutral beam propagation in space, 15:29339 (R;US)
Stationary flow model of ablatively imploded spherical shells, 15:29846 (J;US)
Summary of IAEA technical committee meeting on impurity control, 15:29806 (R;JP)
Toroidal microinstability studies of high-temperature tokamaks, 15:29784 (J;US)

PLASMA ACCELERATORS
See PLASMA GUNS

PLASMA DENSITY
Density fluctuation measurements on the ATF [Advanced Toroidal Facility] using a two-frequency reflectometer, 15:29624 (R;US)
Fundamentals of collective scattering experiments, 15:29689 (R;NL)
The ATF two-frequency correlation reflectometer, 15:29623 (R;US)
The laser, measuring instrument for plasmas, 15:29668 (R;CH;In French)

PLASMA DIAGNOSTICS
Microwave absorption diagnostics on the MTX Tokamak, 15:29770 (BA;US)
Theory and measurements of electrophoretic effects in monolith, fixed-bed, and fluidized-bed plasma reactors, 15:29769 (BA;US)

Beam Injection
Diagnostics using an injected neutral helium beam, 15:29743 (BA;US)

Carbon Dioxide Lasers
Detection limits in the measurement of alpha particles by CO_2 laser Thomson scattering, 15:29755 (BA;US)
High power, twin frequency FIR lasers for plasma diagnostic application, 15:29765 (BA;US)

Computer Codes
The development of a plasma fluctuation diagnostic software tool, 15:29696 (BA;US)

Data Acquisition
Measurements of waves, fields, and particles in a laboratory plasma, 15:29742 (BA;US)

Data Acquisition Systems
Data acquisition and display in space plasma physics, 15:29702 (BA;US)

Electric Discharges
Interference and schlieren diagnostics of current sheath generated by coaxial gun, 15:29650 (RA;CS)

Electron Density
The injected internal target technique, $(IT)^2$, for hot electron diagnostics, 15:29754 (BA;US)

Emission Spectroscopy
Optical diagnostics of discharges, 15:29649 (RA;CS)
Plasma temperature measurements based on discrete atomic and molecular spectra - a critical discussion, 15:29642 (RA;CS)
Spectroscopic diagnostics of some plasmas used in technology processes, 15:29643 (RA;CS)

Equipment
Nanosecond framing photography for laser-produced interstreaming plasmas, 15:29777 (BA;US)

Fabry-Perot Interferometer
Time stability influence of the FPI on the accuracy of measurement of spectral line profiles in plasma physics, 15:29648 (RA;CS)

Fluctuations
Density fluctuation measurements in the TORTUR tokamak, 15:29684 (RA;NL)

Fluorescence Spectroscopy
A cw dye laser system for Li beam spectroscopy in a tokamak, 15:29690 (BA;US)

Interferometry
Microwave tokamak experiment (MTX) status and plans, 15:29767 (BA;US)

Ion Probes
Heavy ion beam probe diagnostic system for ATF, 15:29709 (BA;US)
Simultaneous detection of multiply charged species from a heavy ion beam probe, 15:29744 (BA;US)
Simultaneous measurements of radial and poloidal wavenumbers using a heavy ion beam probe, 15:29707 (BA;US)
TEXT heavy ion beam probe, 15:29708 (BA;US)

Langmuir Probe
Double probe characteristics in the case of nonmaxwellian distributions of electrons, 15:29651 (RA;CS)

Lasers
The laser, measuring instrument for plasmas, 15:29668 (R;CH;In French)

Magnetoacoustic Waves
The frequency splitting of the axisymmetric magnetoacoustic wave as a current profile diagnostic, 15:29670 (R;CH)

Measuring Instruments
Design concepts for compact mass/energy charge exchange analyzers, 15:29714 (BA;US)
Diagnostics for space and time resolved ion temperature measurements in the STRO-M tokamak, 15:29715 (BA;US)
Feasability study of using the TFTR Thomson scattering system for q profile measurements, 15:29713 (BA;US)
The PLT and PDX charge-exchange analyzers, 15:29746 (BA;US)
The TFTR edge Thomson scattering system, 15:29712 (BA;US)

Measuring Methods
Barium ion beam magnetic field and space potential diagnostic, 15:29706 (BA;US)

Neutral Particles
A time-of-flight spectrometer for detection of low energetic hydrogen atoms, 15:29685 (RA;NL)

Nitrogen
Quick gas rotational temperature determination in a plasma reactor, 15:29647 (RA;CS)

Plasma Density
Density fluctuation measurements in the TORTUR tokamak, 15:29684 (RA;NL)
Raman Spectroscopy
On the potential of CARS spectroscopy in low-temperature plasma diagnostics, 15:29644 (RA;CS;In Russian)
Ruby Lasers
Highly doped ruby filters for stray light reduction in Scatpak II, 15:29710 (BA;US)
Signal Conditioning
Use of the Kalman filter in signal processing to reduce beam requirements for alpha-particle diagnostics, 15:29704 (BA;US)
Spectroscopy
A two-dimensional Thomson scattering system for ATF, 15:29745 (BA;US)
Thomson Scattering
Design of a high power long pulse CO_2 laser for alpha particle Thomson scattering, 15:29756 (BA;US)
Time-Of-Flight Method
Double scatter neutron time-of-flight spectrometer as a plasma diagnostic, 15:29749 (BA;US)
X-Ray Spectroscopy
Time resolved XUV spectroscopy from highly ionized capillary discharges, 15:29771 (BA;US)

PLASMA DIODES

SEMICONDUCTOR MATERIALS
Generalized embedded-atom format for semiconductors, 15:29589 (J;US)
Increased stuck-at fault coverage with reduced I_{DDQ} test sets, 15:28550 (R;US)
Surface chelation of semiconductors and interfacial electron transfer, 15:28575 (J;US)

SEMILEPTONIC DECAY
D_s^+ semileptonic decays at a τ-Charm Factory, 15:29420 (RA;US)
Improved limit on the branching ratio of $K^+ \rightarrow \pi^+ \mu^+ e^-$, 15:29451 (J;US)
Leptonic and semileptonic d-decays from QCD sum rules, 15:29422 (RA;US)
Semileptonic charm decay at a tau charm factory, 15:29419 (RA;US)
V_{cd} and V_{cs} from current models, 15:29421 (RA;US)

SENIOR CENTERS
See PUBLIC BUILDINGS

SEPARATION PROCESSES
See also CHROMATOGRAPHY
EXTRACTION
ISOTOPE SEPARATION
REPROCESSING
Laser particle sorter, 15:28785 (P;US)

SEWAGE SLUDGE
Assessment of sewage sludge treatment processes for the purpose of determining technical operating parameters, 15:28340 (R;DE;In German)
Data-element dictionary 1988 sewage-sludge use and disposal: Questionnaire data base, 15:28128 (R;US)
National Sewage-Sludge Survey facility analytical results. Volume 1-4, 15:28127 (R;US)
Superfund Record of Decision (EPA Region 5): Alsco Anaconda, OH. (First remedial action), September 1989, 15:29094 (R;US)

SH-PROTEINASES
[Processing and targeting of the thiol protease aleurain]: Progress report, 15:29115 (R;US)

SHAPE MEMORY EFFECT
Development of the remote-controlled electrical resistance measurement apparatus, 15:28953 (R;JP;In Japanese)

SHEAR
Studies of computational models for jointed media with orthogonal sets of joints (Yucca Mountain Project), 15:27723 (R;US)

SHEATHS (FUEL)
See FUEL CANS

SHELL MODELS
Proceedings of a symposium on the occasion of the 40th anniversary of the nuclear shell model: Part 2, Poster papers, 15:29544 (R;US)
The nuclear shell model: Proceedings, 15:29546 (B;NL)

SHELLS
Application of a mixed Galerkin/least-squares method to axisymmetric shell problems subjected to arbitrary loading, 15:28720 (R;BR)
Stationary flow model of ablatively imploded spherical shells, 15:29846 (J;US)

SHF RADIATION
See RADIOWAVE RADIATION

SHIELDS
Comparison of experimental and numerical results on microwave coupling into cylindrical enclosures, 15:28773 (BA;US)

SHIP PROPULSION REACTORS
Experimental study on the critical heat flux in a varying acceleration field, (2): The measurement of critical heat flux under varying acceleration field, 1, 15:27973 (R;JP;In Japanese)

SHOWER COUNTERS
A high resolution barium fluoride crystal array, 15:28828 (BA;US)
Development of radhard VLSI electronics for SSC calorimeters, 15:28812 (BA;US)
[L* detector as one of the systems proposed for use on the Superconducting Super Collider]: Foreign trip report, February 21–March 01, 1990, 15:28912 (R;US)

SIALON
See ALUMINIUM OXIDES
SILICON NITRIDES

SIGMA MODEL
The O(N)-symmetric non-linear σ-model to three leading orders in 1/N, 15:29493 (R;DK)

SIGMA-410 RESONANCES
See SIGMA MODEL

SILANES
$\sigma\pi$ charge-transfer excited states of substituted (phenylethynyl)pentamethyldisilanes, 15:28592 (J;US)
Observation of the lowest triplet state in silane by electron energy loss spectroscopy, 15:28589 (J;US)
Role of band-tail carriers in metastable defect formation and annealing in hydrogenated amorphous silicon, 15:28578 (J;US)

SILICA
Acoustic damage to large-aperture optics, 15:28935 (BA;US)
Experimental studies on the rheology of hard-sphere suspensions near the glass transition, 15:28655 (J;US)
Health-hazard evaluation report HETA 89-142-1981, Seagull Industries, West Balm Feach, florida, 15:29007 (R;US)
Internal structure of porous silica: A model system for characterization by nuclear magnetic resonance, 15:28521 (J;US)
Measurements of optical loss in transparent solids using a novel spectrometer based on optical cavity decay, 15:28936 (BA;US)
Thermodynamic analysis of chemical stability of ceramic materials in hydrogen-containing atmospheres at high temperatures. Final report, 15:28493 (R;US)

SILICA GEL
Surface structure and chemistry of high surface area silica gels, 15:28496 (R;US)

SILICON
Atomistic simulation of silicon grain boundaries, 15:28564 (BA;US)
Dynamics of rapid solidification in silicon, 15:28560 (BA;US)
Experimental evaluation of chemical cleaning processes for high-lifetime silicon processing, 15:28552 (R;US)
Vibrational localization and vibrational spectra in amorphous silicon, 15:28428 (BA;US)
X-ray specular reflection studies of silicon coated by organic monolayers (alkylsiloxanes), 15:28579 (J;US)

SILICON ALLOYS
Vibrational localization and vibrational spectra in amorphous silicon, 15:28428 (BA;US)
SILICON CARBIDES
3M-4 - Fabrication of commercial-scale fiber-reinforced hot-gas filters by chemical vapor deposition, 15:27936 (RA;US)
Determination of fiber/matrix interfacial properties of ceramic and glass matrix composites. Interim report, 1 January 1986-1 January 1988, 15:28546 (R;US)
INEL-1(A) - Nondestructive evaluation of advanced ceramic composite materials, 15:27904 (RA;US)
INEL-1(B) - Joining of silicon carbide-reinforced ceramics, 15:27905 (RA;US)
LANL-1 - Short fiber reinforced structural ceramics, 15:27907 (RA;US)
NCAT-1 - Mechanical properties testing of ceramic fiber-ceramic matrix composites, 15:27909 (RA;US)
Thermodynamic analysis of chemical stability of ceramic materials in hydrogen-containing atmospheres at high temperatures. Final report, 15:28493 (R;US)
SILICON CHLORIDES
The spectroscopic study of $SiCl_4$ in 400 kHz low pressure plasma etch reactor, 15:29645 (RA;CS)
SILICON HYDRIDES
See SILANES
SILICON NITRIDES
CERAMATEC-1 - Design, fabrication, and interface characterization of ceramic fiber-ceramic matrix composites, 15:27901 (RA;US)
GT-1 - Development of advanced fiber-reinforced ceramics, 15:27903 (RA;US)
ORNL-1(A) - Fabrication of fiber-reinforced composites, 15:27911 (RA;US)
Spectral characteristics of chemically active high-pressure plasma used for silicon nitride synthesis, 15:29641 (RA;CS)
Thermodynamic analysis of chemical stability of ceramic materials in hydrogen-containing atmospheres at high temperatures. Final report, 15:28493 (R;US)
SILICON OXIDES
See also SILICA
Synthesis of ultrafine powders by an inductively coupled plasma, 15:28489 (RA;CS)
X-ray specular reflection studies of silicon coated by organic monolayers (alkylsiloxanes), 15:28579 (J;US)
SILICON SOLAR CELLS
Experimental evaluation of chemical cleaning processes for high-lifetime silicon processing, 15:28552 (R;US)
Outdoor stability performance of thin-film photovoltaic modules at SERI, 15:27855 (BA;US)
SILOXANES
X-ray specular reflection studies of silicon coated by organic monolayers (alkylsiloxanes), 15:28579 (J;US)
SILVER
Raman intensities and interference effects for thin films adsorbed on metals, 15:29373 (J;US)
SINTERED MATERIALS
Phase analysis of sintered and non-sintered straw with and without kaolin or dolomite additions, 15:27839 (R;SE;In Swedish)
SKIN
Limit for exposure to "hot particles" on the skin, 15:29178 (R;US)
Low-density microcellular polymer foams: Applications in biomaterials, 15:28557 (BA;US)
SKIN DAMAGE
See FORMATION DAMAGE
SKIN EFFECT (WELL)
See FORMATION DAMAGE
SLAGS
Heat of hydration and characterization of reaction products of adiabatically cured fly ash and slag mixtures, 15:27452 (BA;US)
SLUDGES
See also SEWAGE SLUDGE
Energy production by anaerobic digestion of waste sludge from wood processing industries, 15:27821 (RA;SE;In Swedish, English, Norwegian, Dan)
Mineralogy of weathered flue gas desulfurization sludges, 15:27454 (BA;US)
SLURRIES
See also FUEL SLURRIES
Turbulence in slurry pipe flow, 15:28717 (R;US)
SLURRIES (FUEL)
See FUEL SLURRIES
SLURRY REACTORS
Heat transfer investigations in a slurry bubble column, 15:27417 (RA;US)
SMALL ANGLE SCATTERING
Menu handling in on-line data processing systems shown by the example of the JUSIFA small-angle scattering facility, 15:28897 (R;DE;In German)
SMELTING
Outokumpu ferrochrome process, 15:28303 (RA;FI)
SMOKATRON
See ELECTRON-RING ACCELERATORS
SNR REACTOR
Analysis of SIMMER calculations for SNR-300 performed at the University of Bremen, 15:28061 (R;DE;In German)
SNR-1 REACTOR
See SNR REACTOR
SNR-300 REACTOR
See SNR REACTOR
SOCIOLOGY
A broad research program on the sciences of complexity: Annual report, 15:29890 (R;US)
Understanding the computing system domain of advanced computing with microcomputers, 15:29848 (R;US)
SODIUM CITRATES
See SODIUM COMPOUNDS
SODIUM COMPOUNDS
Modeling and optimizing surfactant structure to improve oil recovery by chemical flooding at the University of Texas: Final report, October 1987–September 1988, 15:27534 (R;US)
Reactions of intermetallic clusters, 15:28659 (J;US)
SODIUM IODIDE DETECTORS
See NAI DETECTORS
SODIUM LAURYL SULFATES
See SODIUM COMPOUNDS
SODIUM MINERALS
See MINERALS
SOFT X RADIATION
Characterization of aluminum x-pinch plasmas driven by the 0.5 TW Lion accelerator, 15:29774 (BA;US)
SOILS
Cementing
Soil and rock grouting: Preliminary study, 15:28743 (R;FI;In Finnish)
Chemical Properties
Effect of controlled overburden placement on mine-soil properties and the growth of loblolly pine. Final report, 15:27457 (R;US)
Contamination
2,3,7,8-tetrachlorodibenzo-p-dioxin: Aspects of its important properties and its potential biodegradation in soils, 15:29057 (J;US)
Installation-restoration Program Phase 2. Confirmation/quantification, Stage 1. Kalispell Air Force Station, Montana. Final report, October 1986-March 1989, 15:27562 (R;US)
Superfund Record of Decision (EPA Region 1): Kellogg-Deering Well Field, Norwalk, CT. (Second Remedial Action), September 1989, 15:29076 (R;US)
Superfund Record of Decision (EPA Region 1): O'Connor Company Site, ME. (First Remedial Action), September 1989. Final report, 15:27567 (R;US)
Superfund Record of Decision (EPA Region 1): South Municipal Water Supply Well, BH. (First remedial action), September 1989, 15:29093 (R;US)
Superfund Record of Decision (EPA Region 1): W. R. Grace Acton, Massachusetts (First remedial action), September 1989, 15:29095 (R;US)

Superfund Record of Decision (EPA Region 2): Chemical Insecticide, Middlesex County, NJ. (First Remedial Action), September 1989, 15:29074 (R;US)
Superfund Record of Decision (EPA Region 2): Ewan Property, NJ. (Second Remedial Action), September 1989. Final report, 15:29072 (R;US)
Superfund Record of Decision (EPA Region 3): Cryochem, Berks County, PA (First remedial action), September 1989, 15:29091 (R;US)
Superfund Record of Decision (EPA Region 5): Cliff/Dow Dump, Marquette, MI. (First remedial action), September 1989. Final report, 15:27463 (R;US)
Superfund Record of Decision (EPA Region 5): Hedblum Industries, MI. (First remedial action), September 1989. Final report, 15:29092 (R;US)
Superfund Record of Decision (EPA Region 5): Rose Township Cemetery Dump Site, Oakland County, Michigan. (Second remedial action), September 1989. Final report, 15:29051 (R;US)
Superfund Record of Decision (EPA Region 5): Wausau Water Supply, Wisconsin. (Second remedial action), September 1989. Final report, 15:27571 (R;US)
Superfund Record of Decision (EPA Region 7): Chemplex, Clinton, IA. (First remedial action), September 1989, 15:29089 (R;US)
Superfund Record of Decision (EPA Region 7): Doepke Disposal (Holliday), KS. (First remedial action), September 1989. Final report, 15:29090 (R;US)
Superfund Record of Decision (EPA Region 8): Burlington Northern (Somerset Plant), Somers, MT. (First remedial action), September 1989. Final report, 15:27464 (R;US)
Superfund Record of Decision (EPA Region 8): Woodbury Chemical, Commerce City, CO. (Second remedial action), September 1989. Final report, 15:27570 (R;US)
Technologies of delivery or recovery for the remediation of hazardous-waste sites, 15:29050 (R;US)

Decontamination
Bioremediation of contaminated surface soils, 15:29246 (R;US)
Engineering-scale demonstration of thermal desorption technology for manufactured gas plant site soils, 15:27460 (R;US)

Electric Heating
In situ treatment for contaminated soils, 15:29054 (BA;US)

Grouting
Soil and rock grouting: Preliminary study, 15:28743 (R;FI;In Finnish)

Oil Spills
An overview and suggested methodology to determine the adequacy of cleanup of contaminated soils, 15:27574 (BA;US)

Pollutants
Petroleum contaminated soils. Volume 2, 15:27573 (B;US)

Radionuclide Kinetics
Cs-137 soil to plant transfer factors derived from pot experiments and field studies, 15:29179 (R;AT)

Radionuclide Migration
Application of surface complexation models for radionuclide adsorption: Sensitivity analysis of model input parameters, 15:27703 (R;US)
Cs-137 soil to plant transfer factors derived from pot experiments and field studies, 15:29179 (R;AT)
The environmental behaviour of Chernobyl deposition in a high fallout region of Sweden: analysis of the results of a soil measurement programme, 15:29043 (R;GB)

Remedial Action
USATHAMA [US Army Toxic and Hazardous Materials Agency] installation restoration program research and development strategies, 15:29044 (R;US)

Sampling
A survey for elevated levels of uranium north of the 300 Area on the Hanford Site, 15:27761 (R;US)

Sorptive Properties
Application of surface complexation models for radionuclide adsorption: Sensitivity analysis of model input parameters, 15:27703 (R;US)

SOLANUM TUBEROSUM
Evidence from Solanum tuberosum in support of the dual-pathway hypothesis of aromatic biosynthesis, 15:29148 (J;US)

SOLAR ACTIVITY

SOLAR PROMINENCES
SOLAR RADIO BURSTS
SOLAR WIND
SUNSPOTS
Solar-Geophysical Data Number 542, October 1989. Part 2 (comprehensive reports). Data for April 1989 and miscellaneous, 15:29329 (R;US)

SOLAR ATMOSPHERE
Determination of solar flare accelerated ion angular distributions from SMM gamma ray and neutron measurements and determination of the He-3/H ratio in the solar photosphere from SMM gamma ray measurements. Final technical report, 1 July 1987-31 August 1989, 15:29328 (R;US)

SOLAR CELL RECEIVERS
See SOLAR RECEIVERS

SOLAR CELLS
See also COPPER SULFIDE SOLAR CELLS
INDIUM PHOSPHIDE SOLAR CELLS
SILICON SOLAR CELLS
High-efficiency silicon solar cells for a 22-sun line-focus module, 15:27853 (R;US)
Optical coatings. November 1983-December 1989 (A Bibliography from the NTIS dat abase). Report for November 1983-December 1989, 15:27852 (R;US)

SOLAR COLLECTORS
See also FLAT PLATE COLLECTORS
SOLAR TRACKING SYSTEMS
Optical coatings. November 1983-December 1989 (A Bibliography from the NTIS dat abase). Report for November 1983-December 1989, 15:27852 (R;US)

SOLAR CONCENTRATORS
High-efficiency silicon solar cells for a 22-sun line-focus module, 15:27853 (R;US)
Support and maneuvering apparatus for solar energy receivers, 15:27861 (P;US)

SOLAR DOMESTIC WATER HEATING
See SOLAR WATER HEATING

SOLAR ENERGY
Getting the solar message to the layman, 15:27847 (J;US)
Green solar architecture. Results of measurements and energy analysis of two solar houses in Tuebingen, 15:27866 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Zirndorf-Weiherhof, 15:27864 (R;DE;In German)
Passive utilization of solar energy in owner-occupied private homes - results of measurements and energy analysis of the solar house in Darmstadt, 15:27865 (R;DE;In German)

SOLAR FLARES
Determination of solar flare accelerated ion angular distributions from SMM gamma ray and neutron measurements and determination of the He-3/H ratio in the solar photosphere from SMM gamma ray measurements. Final technical report, 1 July 1987-31 August 1989, 15:29328 (R;US)
Solar flares and dynamics of Langmuir waves in current-carrying plasmas, 15:29638 (R;CS)
Solar-Geophysical Data Number 542, October 1989. Part 2 (comprehensive reports). Data for April 1989 and miscellaneous, 15:29329 (R;US)

SOLAR HEATING SYSTEMS
Solar heating system with short-term storage, 15:27863 (R;SE;In Swedish)

SOLAR NEBULA
Non-equilibrium chemistry in the solar nebula and early solar system: Implications for the chemistry of comets, 15:29294 (RA;US)
Physical processing of cometary nuclei, 15:29324 (RA;US)
Solar nebula condensates and the composition of comets, 15:29306 (RA;US)

SOLAR PARTICLES
Determination of solar flare accelerated ion angular distributions from SMM gamma ray and neutron measurements and determination of the He-3/H ratio in the solar photosphere from SMM gamma ray measurements. Final technical report, 1 July 1987-31 August 1989, 15:29328 (R;US)

SOLAR POWER PLANTS
See also PHOTOVOLTAIC POWER PLANTS
SOLAR THERMAL POWER PLANTS
An assessment of second-generation stretched-membrane mirror modules, 15:27859 (R;US)

Nuclear spectroscopy and nuclear structure. Electromagnetic transitions in atomic nuclei: Summaries of report, 15:29506 (R;SU;In Russian)
SPENT FUEL CASKS
Acceptance of canisters of consolidated spent nuclear fuel by the Federal Waste Management System, 15:27707 (R;US)
Feasibility of performing criticality experiments with spent LWR fuel, 15:27673 (RA;US)
SPENT FUEL ELEMENTS
Calculation of health risks from spent-nuclear-fuel transportation accidents, 15:27672 (BA;US)
Supplement to ORNL/Sub/86-SA094/1 on use of transportable storage casks in the nuclear waste management system, 15:27705 (R;US)
SPENT FUELS
Effects of water composition on the dissolution rate of UO_2 under oxidizing conditions, 15:27719 (R;US)
SPENT LIQUORS
Chemical composition and combustion properties of black liquor, 15:28310 (R;FI;In Finnish)
Safety analysis of a black liquor recovery boiler plant, 15:28307 (RA;FI)
SPHEROMAK DEVICES
See also CTX SPHEROMAK
A new diagnostic for spheromaks: What are the possibilities, 15:29740 (BA;US)
Diagnostics using an injected neutral helium beam, 15:29743 (BA;US)
SPICES
Thermoluminescence and chemiluminescence measurements for detection of radiation treatment of spices: A European interlaboratory comparison, 15:28678 (R;DE;In German)
SPICULES
See SOLAR PROMINENCES
SPIN
Higher-spin symmetry in one and two dimensions, (2), 15:29490 (R;JP)
SPONTANEOUS FISSION
Applications of the maximum entropy principle in nuclear physics, 15:29549 (R;DE)
SPROUT INHIBITION
Sprout inhibition and change in organic components of potato by gamma-irradiation, 15:29166 (R;JP)
SPRUCES
Effects of acid rain and liming on a spruce site (Hoeglwald project), 15:29207 (RA;DE;In German)
Air Pollution
Effects of air pollutants and other stress factors on phytohormone concentrations in trees, 15:29227 (RA;DE;In German)
Effects of immissions on spruce stand ecosystems - results of forest damage research in the Fichtelgebirge mountains, 15:29204 (RA;DE;In German)
Gas exchange experiments on spruce trees in pure and ambient air in order to determine the air pollutant stress of the stand, 15:29203 (RA;DE;In German)
Peroxide detoxification of spruce needles in forest sites of the Northern Alps (Wank), 15:29226 (RA;DE;In German)

Aluminium Compounds
Metabolic studies in a Norway spruce stand (Picea abies Karst.) in the high mountain region of Eastern Bavaria, 15:29200 (RA;DE;In German)
Metabolism
Metabolic studies in a Norway spruce stand (Picea abies Karst.) in the high mountain region of Eastern Bavaria, 15:29200 (RA;DE;In German)
Nitrogen Isotopes
Uptake, discharge and metabolism of NO_x, NH_4^+ and nitrate in forest trees, especially spruce trees, 15:29206 (RA;DE;In German)
Nitrogen Oxides
Uptake, discharge and metabolism of NO_x, NH_4^+ and nitrate in forest trees, especially spruce trees, 15:29206 (RA;DE;In German)
Nutrients
Annual curves of changes in chloroplast pigments in a polluted spruce stand in the Fichtelgebirge mountains as a function of age and mineral nutrition of the needles, 15:29205 (RA;DE;In German)
Development of acute yellowing in spruce trees, 15:29202 (RA;DE;In German)
Induction and healing of acute yellowing in spruce trees as a function of nutrient supply, 15:29201 (RA;DE;In German)
Metabolic studies in a Norway spruce stand (Picea abies Karst.) in the high mountain region of Eastern Bavaria, 15:29200 (RA;DE;In German)
Pathological Changes
Annual curves of changes in chloroplast pigments in a polluted spruce stand in the Fichtelgebirge mountains as a function of age and mineral nutrition of the needles, 15:29205 (RA;DE;In German)
Development of acute yellowing in spruce trees, 15:29202 (RA;DE;In German)
Effects of immissions on spruce stand ecosystems - results of forest damage research in the Fichtelgebirge mountains, 15:29204 (RA;DE;In German)
Gas exchange experiments on spruce trees in pure and ambient air in order to determine the air pollutant stress of the stand, 15:29203 (RA;DE;In German)
Induction and healing of acute yellowing in spruce trees as a function of nutrient supply, 15:29201 (RA;DE;In German)
Pigments
Annual curves of changes in chloroplast pigments in a polluted spruce stand in the Fichtelgebirge mountains as a function of age and mineral nutrition of the needles, 15:29205 (RA;DE;In German)
Plant Growth
A survey of radial growth trends in spruce in the Great Smoky Mountains National Park as influenced by topography, age, and stand development, 15:29181 (R;US)
SPUTTER-ION PUMPS
Reduction-type current-limiting ion pump power source, 15:28859 (RA;JP;In Japanese)
SPUTTERING
Method of producing non-agglomerating submicron size particles, 15:29590 (P;US)
STABILITY
Block analysis for preliminary design of underground excavations, 15:29278 (R;US)
STAINLESS STEEL-18-4-1
See STAINLESS STEELS
STAINLESS STEEL-19-9DL
See STAINLESS STEELS
STAINLESS STEEL-304
Evaluation of the onset of tertiary creep for types 304 and 316 stainless steels, 15:28396 (R;FR)
Surface mechanical properties of Ti alloys produced by excimer laser mixing of Ti on AISI 304 stainless steel, 15:28422 (BA;US)
Weld pool development during GTA and laser beam welding of Type 304 stainless steel: Part II-experimental correlation, 15:28455 (J;US)
STAINLESS STEEL-308
The effect of aging at 343°C on type 308 stainless steel weldments, 15:28389 (R;US)
STAINLESS STEEL-316
Corrosion studies of a stainless steel structure for the ITER [International Thermonuclear Experimental Reactor] aqueous lithium salt blanket concept: Technical progress report, 15:29799 (R;US)
Evaluation of the onset of tertiary creep for types 304 and 316 stainless steels, 15:28396 (R;FR)
STAINLESS STEELS
Correlation of irradiation-induced transition temperature increases from C_v and K_{Jc}/K_{Ic} data: Final report, 15:28002 (R;US)
Friction welded closures of waste canisters, 15:27751 (BA;US)
Stress corrosion of stainless steel. January 1976-June 1987 (A Bibliography from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1976-June 1987, 15:28409 (R;US)
Stress corrosion of stainless steel. July 1987-January 1990 (A Bibliography from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for July 1987-January 1990, 15:28410 (R;US)
The major result of the PISC RRT on cast stainless steel components, 15:28084 (BA;US)
STANDARD ELECTROWEAK MODEL
See WEINBERG-SALAM GAUGE MODEL
STANDING CROP
See BIOMASS
STATE BUILDINGS
See PUBLIC BUILDINGS
STATISTICAL MODELS
Analysis of extreme winds at Pacific Northwest wind energy survey sites, 15:27876 (R;US)
STEAM
An investigation of steam-explosion loadings with SIMMER-2, 15:28062 (R;US)
STEAM COOLANT
See STEAM
STEAM GENERATION
See also COGENERATION
Cogeneration in the Hawaiian sugar industry, 15:28287 (R;US)
STEAM GENERATORS
Effect of different thermal treatments on the corrosion resistance of alloy 690 tubing: Final report, 15:27999 (R;US)
Evaluation of sampling schemes for in-service inspection of steam generator tubing: Final report, 15:27968 (R;US)
Proceedings: 1987 symposium on chemistry in high-temperature water, 15:27954 (R;US)
Proceedings: Workshop on the role of sulfur species on the secondary-side degradation of Alloy 600 and related alloys, 15:27955 (R;US)
STEAM LINES
An analysis of MB-2 100% steam line break test T-2013 using RELAP5/MOD2, 15:27961 (R;GB)
An analysis of semiscale MOD-2c S-FS-1 steam line break test using RELAP5/MOD2, 15:27960 (R;GB)
STEAM SUPERHEATERS
See SUPERHEATERS
STEAM TURBINES
A theoretical analysis of flow through the nucleating stage in a low pressure steam turbine, 15:27998 (R;GB)
Turbine-generator replacement study, 15:27940 (J;US)

FERRITIC STEELS
LOW ALLOY STEELS
Application of DYNA3D to dynamic loading on concrete and steel structures, 15:28695 (R;GB)
Correlation of irradiation-induced transition temperature increases from C_v and K_{Jc}/K_{Ic} data: Final report, 15:28002 (R;US)
Impurity-induced in interfacial strength and their role in creep fracture, 15:28437 (BA;US)
Influence of fluence rate on radiation-induced mechanical property changes in reactor pressure vessel steels: Final report on exploratory experiments, 15:28001 (R;US)
Joint research centre fusion materials irradiations in HFR: present status and prospectives, 15:28397 (R;FR)
Tribology of amorphous alloys formed with ion beams, 15:28421 (BA;US)
STERN-GERLACH EXPERIMENT
Repetitive Stern-Gerlach effect, 15:29598 (R;US)
STIRLING ENGINES
Stress and fatigue analysis of the Stirling engine SCP 1-75 cylinder head, 15:28352 (R;SE;In Swedish)
STOMATA
Sorption and permeation characteristics of cuticles for monoterpenes, with particular regard to the effects of gaseous pollutants on spruce trees, 15:29216 (RA;DE;In German)
STORAGE (WASTES)
See WASTE STORAGE
STORAGE BATTERIES
See ELECTRIC BATTERIES
STORAGE DEVICES (DATA)
See MEMORY DEVICES
STORAGE FACILITIES
Evaluation of closure capping on groundwater flow and solute transport at the General Separations Area: Flow model and particle-tracking analysis of closure caps with runoff, 15:27745 (R;US)
Hanford waste vitrification plant project plant acquisition plan, 15:27744 (R;US)
Safety analysis of a process plant according to a modified PAAG procedure for a liquefied gas storage facility, 15:27834 (R;DE;In German)
STORAGE RINGS
See also DORIS STORAGE RING
HERA STORAGE RING
LEP STORAGE RINGS
PEP STORAGE RINGS
POPAE STORAGE RING
SUPERCONDUCTING SUPER COLLIDER
TRISTAN STORAGE RINGS
A fast injection system with a superconducting accumulator ring for a Tau Charm Factory, 15:29403 (RA;US)
Crab-crossing in a tau-charm facility, 15:29386 (RA;US)
The τ-charm factory storage ring initial design and parameters, 15:29385 (RA;US)
Vaccum system for 8GeV storage ring, 15:28884 (RA;JP;In Japanese)
Vaccum system for storage ring in Taiwan, 15:28883 (RA;JP;In Japanese)

STOVER
See AGRICULTURAL WASTES
STRAIN GAGES
Dynamic strain gages analysis of critical welds used in power plant circuit breakers, 15:28943 (R;US)
Small strain gage applications 2, 15:28954 (R;US)
STRAND BREAKS
Production of DNA strand breaks by direct effects of heavy charged particles, 15:29191 (J;US)
STRANGE MESONS
See also KAONS
Phenomenology of the CKM matrix, 15:29483 (J;US)
STRATEGIC DEFENSE INITIATIVE
See BALLISTIC MISSILE DEFENSE
STRATEGIC PETROLEUM RESERVE
A local similarity model for turbulent natural convection along a vertical surface, 15:27531 (R;US)
STRAW
The straw/methane method, 15:27822 (RA;SE;In Swedish)
STREAK CAMERAS
A comparison of flat-field measurement techniques for optical streak cameras, 15:28932 (BA;US)
A performance evaluation of three high-fidelity streak cameras., 15:28934 (BA;US)
Comparison of mechanical and electronic high-speed recording systems, 15:28939 (BA;US)
Resolution limitations and optimization of the ITT F4157 streak tube focus for 10-ps operation., 15:28918 (BA;US)
The effects of variations in the photocathode voltages of electronic streak cameras., 15:28917 (BA;US)
Veiling glare in the ITT F4113 image intensifier., 15:28919 (BA;US)
STREAMER SPARK CHAMBERS
Position sensing with magic gas mixture in the transition region from the proportional to the self-quenching streamer mode, 15:28902 (RA;JP)
Properties of self-quenching streamer (SQS) tubes, 15:28901 (RA;JP)
Rare-gas dependence of the self-quenching streamer, 15:28903 (RA;JP)
STREAMS
See also RIVERS
Evaluation of stream liming effects on water quality and spawning of migratory fishes in Maryland Coastal Plain streams. 1988 results. Final report, 15:29088 (R;US)
STREETS
See ROADS
STRESSES
Block analysis for preliminary design of underground excavations, 15:29278 (R;US)
STRING MODELS
Abelization by operator equivalence in string theory, 15:29499 (R;AT)
Covariant virasoro operators, 15:29497 (R;AT)
On the Phase transition to spacetime in string cosmology, 15:29334 (J;US)
On the classical geometry of bosonic string dynamics, 15:29496 (R;AT)
The classical geometry of Bosonic Strings, 15:29479 (R;AT)
STRONTIUM
Effects of mineralogy on sorption of strontium and cesium onto Calico Hills Tuff, 15:27701 (R;US)

Topotactic and epitactic routes to new materials: Progress report, 15:28486 (R;US)

STRONTIUM OXIDES
Elastic softening and internal friction in $La_{2-x}Sr_xCuO_4$, 15:28514 (J;US)

STRUCTURAL BUCKLING

SUBSURFACE ENVIRONMENTS
DUVAS [derivative ultraviolet absorption spectrometry] fiberscope for in situ groundwater monitoring, 15:29065 (R;US)

SUBSURFACE STRUCTURES
Detection and imaging of buried wastes using seismic wave propagation, 15:28146 (J;US)

SUBURBS
See URBAN AREAS

SULFATE-REDUCING BACTERIA
The influence of sulfate concentrations on the methane production in anaerobic reactors, 15:27811 (RA;SE;In Danish)

SULFATES
See also CALCIUM SULFATES
Monitoring of atmospheric particles and ozone in Sequoia National Park: 1985-1987. Final report, 15:29002 (R;US)

SULFIDES
See also HAFNIUM SULFIDES
HYDROGEN SULFIDES
IRON SULFIDES
MOLYBDENUM SULFIDES
TITANIUM SULFIDES
ZIRCONIUM SULFIDES
Adsorbate thermodynamics as a determinant of reaction mechanism: Pentamethylene sulfide on Mo(110), 15:28656 (J;US)

SULFITE WASTE LIQUOR
See SPENT LIQUORS

SULFONATES
Modeling and optimizing surfactant structure to improve oil recovery by chemical flooding at the University of Texas: Final report, October 1987–September 1988, 15:27534 (R;US)

SULFUR
By-product sulfur from the stabilization of coal solid wastes, 15:27453 (BA;US)
High-temperature sulfidation-regeneration of $CuO-Al_2O_3$ sorbents, 15:28654 (J;US)

SULFUR COMPOUNDS
See also CARBON OXYSULFIDE
SULFATES
SULFIDES
SULFUR FLUORIDES
Bioprocessing of coal and model compounds, 15:27404 (RA;US)
Reply to the Comment on: "Lifetime of the $A\,^2\Sigma^+$, $v'=0$ state of HS", 15:29374 (J;US)

SULFUR DIOXIDE
Cofiring of pelletized refuse-derived fuel with coal to achieve sulfur dioxide emissions requirements, 15:27939 (J;US)
Compatibility of admix and synthetic liner materials with flute gas scrubbing wastes, 15:27945 (B;US)
Effects of SO_2 on chloroplasts and leaves, 15:29209 (RA;DE;In German)
Field evaluation of low-emission coal-burner technology on utility boilers. Volume 1. Distributed mixing burner evaluation. Final report, September 1978-June 1986, 15:27497 (R;US)
Field evaluation of low-emission coal-burner technology on utility boilers. Volume 2. Second-generation low-NOx burners. Final report, September 1978-June 1986, 15:27498 (R;US)
Field evaluation of low-emission coal-burner technology on utility boilers. Volume 4. Alternative concepts for SOx, NOx, and particulate emissions control from a fuel-rich precombustor. Final report, September 1978-June 1986, 15:27500 (R;US)
Field evaluation of low-emission coal-burner technology on utility boilers. Volume 3. Field evaluations. Final report, September 1978-June 1986, 15:27499 (R;US)
Intracellular compartimentation of abscisic acid (ABA) in guard cells and mesophyll cells under exposure to SO_2, 15:29213 (RA;DE;In German)
Investigation of the ability of different sorbent combinations to reduce hydrochloric acid and sulphur dioxide and influence on the production of dioxines during incineration of refuse derived fuels, 15:29025 (R;SE;In Swedish)
Observation of a SO^+_2 threshold photoelectron band in the energy range 14.4–15.5 eV, 15:29369 (J;US)
Reduction of sulfur emission through lime/limestone furnace injection, 15:29023 (R;SE;In Swedish)
Sorption and permeation properties of plant cuticles for gaseous pollutants and water after exposure to gaseous pollutants, 15:29217 (RA;DE;In German)
Sulfate and nitrate concentrations in needles and leaves as indicators of SO_2 or NO_2 pollution, 15:29210 (RA;DE;In German)
Sulfur dioxide and ozone effects on crops: Final report, 15:29197 (R;US)
TGA determination of the sulphur dioxide absorption capacity of some Spanish limestones, 15:27450 (R;SE)

SULFUR FLUORIDES
Catalytic decomposition of S_2F_{10} and its implications on sampling and detection from SF_6-insulated equipment, 15:28534 (R;US)
Three-conductor compressed-gas cable field demonstration: Volume 1: Manufacture and installation, Final report, 15:28097 (R;US)

SULFUR HYDRIDES
See HYDROGEN SULFIDES

SULFUR SULFIDES
See SULFUR

SUN
Update on the OPAL opacity code, 15:29333 (R;US)

SUNFLOWERS
Quantitative investigations of NO_2-uptake by plants - construction of an exposition system and results with sunflowers (Helianthus annuus L.), 15:29229 (R;DE;In German)

SUNSPOTS
Sunspots: Solar-terrestrial interactions. September 1972-January 1990 (A Bibliography from the International Aerospace Abstracts data base). Report for September 1972-January 1990, 15:29331 (R;US)

SUPER HIGH FREQUENCY RADIATION
See RADIOWAVE RADIATION

SUPERCOMPUTERS
A benchmark package for sparse matrix computations, 15:29926 (BA;US)
Energy and Technology Review, January–February 1990, 15:29912 (R;US)
Federal High-Performance Computing program, 15:29903 (R;US)
Partitioning programs for parallel execution, 15:29922 (BA;US)

SUPERCONDUCTING CABLES
An industrial cabling machine for the SSC, 15:28815 (BA;US)
Development of SSC cable in Furukawa, 15:28817 (BA;US)
Pressure drop measurements on supercritical helium cooled cable in conduit conductors, 15:28781 (J;US)
Recent development of the Cu/Nb-Ti superconducting cables for SSC in Hitachi Cable, Ltd., 15:28829 (BA;US)
Superconducting wire and cable for the SSC - Progress at intermagnetics general corporation towards production, 15:28816 (BA;US)
Superconducting wire and cable for the superconducting supercollider, 15:28814 (BA;US)

SUPERCONDUCTING CAVITY RESONATORS
Operating experience with the 50 helix superconducting resonators of the Saclay heavy ion Linac, 15:28845 (R;FR)

SUPERCONDUCTING COILS
Review on the industrial fabrication of the superconducting HERA quadrupole coils, 15:28821 (BA;US)
SSC dipole coil production tooling, 15:28804 (BA;US)

SUPERCONDUCTING COMPOSITES
D.C. magnetron sputter deposition of thin films from composite targets, 15:28490 (RA;CS)
Hyperfine interactions associated with iron substituted superconducting oxides, 15:29591 (R;US)
Measuring the shielding effectiveness of superconductive composites, 15:28775 (BA;US)
Progress for SSC, 15:28813 (BA;US)

SUPERCONDUCTING DEVICES
See also SUPERCONDUCTING CAVITY RESONATORS
SUPERCONDUCTING MAGNETS
Epoxy-encapsulated ceramic superconductor microelectrodes, 15:28783 (J;US)

SUPERCONDUCTING FILMS
D.C. magnetron sputter deposition of thin films from composite targets, 15:28490 (RA;CS)
INEL-1(C) - Superconducting film fabrication, 15:27906 (RA;US)
Pulsed laser processing of high temperature superconducting thin films, 15:28492 (R;US)
Pulsed-laser deposition of high-t_c superconducting thin films. Final technical report, 15 November 1988-15 October 1989, 15:28458 (R;US)
Superconducting transmission line particle detector, 15:28789 (P;US)

SUPERCONDUCTING MAGNETS
An alternate end design for SSC dipoles, 15:28819 (BA;US)
Conceptual design for the SSC high energy booster, 15:28795 (R;US)
Design note of a 10,000 amp 2 MJoules dump resistor for the magnet test facility, 15:28793 (R;US)
Design principles for prototype and production magnetic measurements of superconducting magnets, 15:28820 (BA;US)
Industrial production of HERA superconducting dipoles, 15:28830 (BA;US)
Measurements of the Fermilab 200 MeV transfer line quadrupole magnets, 15:28847 (R;US)
Performance of full-length SCC model dipoles: Results from 1988 tests, 15:28803 (BA;US)
Progress for SSC, 15:28813 (BA;US)
Recent development of the Cu/Nb-Ti superconducting cables for SSC in Hitachi Cable, Ltd., 15:28829 (BA;US)
S.C. magnet fabrication at Ansaldo, 15:28834 (BA;US)
SSC magnet mechanical interconnections, 15:28823 (BA;US)
Series production of the first 20 superconducting HERA dipole magnets at ABB, 15:28833 (BA;US)
Status of suspension connection for SSC coil assembly, 15:28825 (BA;US)
Superconducting wire and cable for the superconducting supercollider, 15:28814 (BA;US)

SUPERCONDUCTING SUPER COLLIDER
Biological Shielding
Impact of radiation shielding requirements on conventional construction for the SSC, 15:28809 (BA;US)
Charged Particle Detection
Superconducting transmission line particle detector, 15:28789 (P;US)
Design
Conceptual design for the SSC high energy booster, 15:28795 (R;US)
Management
Systems engineering and integrated for the SSC, 15:28811 (BA;US)
Mechanical Structures
Advanced composite structures for superconducting super collider, 15:28826 (BA;US)
Operation
Mechanical support for straw tubes, 15:28794 (R;US)
Radiation Detectors
Development of new scintillating materials for the SSC, 15:28810 (BA;US)
Development of radhard VLSI electronics for SSC calorimeters, 15:28812 (BA;US)
Refrigeration
Labarge liquid helium plant, 15:28818 (BA;US)
Shower Counters
A high resolution barium fluoride crystal array, 15:28828 (BA;US)
Spectrometers
Development of improved, radiation-resistant plastic and liquid scintillators for the SSC, 15:28827 (BA;US)
Superconducting Cables
An industrial cabling machine for the SSC, 15:28815 (BA;US)
Development of SSC cable in Furukawa, 15:28817 (BA;US)
Superconducting wire and cable for the SSC - Progress at intermagnetics general corporation towards production, 15:28816 (BA;US)
Superconducting Coils
SSC dipole coil production tooling, 15:28804 (BA;US)
Superconducting Magnets
An alternate end design for SSC dipoles, 15:28819 (BA;US)
Design principles for prototype and production magnetic measurements of superconducting magnets, 15:28820 (BA;US)
Performance of full-length SCC model dipoles: Results from 1988 tests, 15:28803 (BA;US)
Progress for SSC, 15:28813 (BA;US)
Recent development of the Cu/Nb-Ti superconducting cables for SSC in Hitachi Cable, Ltd., 15:28829 (BA;US)
SSC magnet mechanical interconnections, 15:28823 (BA;US)
Status of suspension connection for SSC coil assembly, 15:28825 (BA;US)
Superconducting wire and cable for the superconducting supercollider, 15:28814 (BA;US)
Superconducting Wires
Superconducting wire and cable for the SSC - Progress at intermagnetics general corporation towards production, 15:28816 (BA;US)
The effects of processing on the filament array in multifilament SSC strand, 15:28822 (BA;US)
Thermal Insulation
Multilayer insulation (MLI) in the superconducting super collider - A practical engineering approach to physical parameters governing MLI thermal performance, 15:28824 (BA;US)
Tunnels
Critical issues concerning tunnel ventilation in the super conducting super collider ring tunnel, 15:28808 (BA;US)
Tunneling technologies for the collider ring tunnels, 15:28805 (BA;US)

SUPERCONDUCTING WIRES
Superconducting wire and cable for the SSC - Progress at intermagnetics general corporation towards production, 15:28816 (BA;US)
Superconducting wire and cable for the superconducting supercollider, 15:28814 (BA;US)
The effects of processing on the filament array in multifilament SSC strand, 15:28822 (BA;US)
Wire inhomogeneity detector having a core with opposing pole pieces and guide pieces adjacent the opposing pole pieces, 15:28788 (P;US)

SUPERCONDUCTIVITY
A virial theorem and the method of simulated annealing in the Ginzburg-Landau theory, 15:29595 (BA;US)
Angle-resolved photoemission study of NiO and CoO, 15:28510 (BA;US)
Anisotropy in magnetic properties of high-T_c materials, 15:29596 (BA;US)
Detection of surface impurity phases in high T superconductors using thermally stimulated luminescence, 15:28790 (P;US)
Electron-phonon interactions in copper-oxides, 15:29594 (BA;US)
Single- vs. multi-orbital theories of the cuprate superconductors: Exact results on finite lattices, 15:29592 (BA;US)
The phonon-plasmon mechanism of high T_c, 15:29593 (BA;US)

SUPERCONDUCTORS
A virial theorem and the method of simulated annealing in the Ginzburg-Landau theory, 15:29595 (BA;US)
Angle-resolved photoemission study of NiO and CoO, 15:28510 (BA;US)
Anisotropy in magnetic properties of high-T_c materials, 15:29596 (BA;US)
Ceramic fabrication processes for high-T_c superconductors, 15:28780 (J;US)
Detection of surface impurity phases in high T superconductors using thermally stimulated luminescence, 15:28790 (P;US)
Determination of internal strains in high-temperature superconductor composites by intense pulsed neutron source, 15:28748 (R;US)
Electrochemically enhanced high T_c superconductor single-crystal flux growth, 15:28782 (J;US)
Electron and proton radiation effects in the high temperature superconductor $YBa_2Cu_3O_{7-\delta}$, 15:28520 (J;US)
Electron-phonon interactions in copper-oxides, 15:29594 (BA;US)
Evidence for phonon-mediated coupling in superconducting $Ba_{1-x}K_xBiO_3$, 15:28511 (BA;US)
High-resolution-angle resolved photoemission studies of high temperature superconductors, 15:29597 (BA;US)
Interfacial structure, properties and design, 15:28498 (B;US)
Magnetization of grain-aligned $HoBa_2Cu_3O_7 - \delta$, 15:28513 (BA;US)
Measuring the shielding effectiveness of superconductive composites, 15:28775 (BA;US)
Overview of current bulk and thick film high temperature superconductor processing strategies, 15:28491 (R;US)
T*-phase superconductivity, 15:28512 (BA;US)
The identification of oxygen related species in the XPS and near edge spectra of the high T_c superconductors, 15:28509 (BA;US)
The phonon-plasmon mechanism of high T_c, 15:29593 (BA;US)

SUPERCRITICAL FLOW
See TURBULENT FLOW

SUPERFUND
Risk-assessment guidance for Superfund. Volume 1. Human Health Evaluation Manual. Part A. Interim report (Final), 15:28129 (R;US)
Risk-assessment guidance for Superfund. Volume 2. Environmental evaluation manual. Interim report (Final), 15:28130 (R;US)

SUPERHEATERS
FW-2 - Fireside corrosion testing of candidate superheater tube alloys, coating, and cladding, 15:27943 (RA;US)

SUPERSYMMETRY
Perturbations of supersymmetric systems in quantum mechanics, 15:29613 (R;AT)
Superconformal models and the supersymmetric coulomb gas, 15:29488 (R;FR)

SUPERVOLTAGE RADIOTHERAPY
See RADIOTHERAPY

SUPPORT PILLARS
Field evaluation of three longwall pillar systems in a Kentucky coal mine. Report of Investigations/1989, 15:27481 (R;US)

SUPPORTS
Development of single-shell construction methods with examples. Report of Bochum Stadtbahnbau, 15:28739 (RA;DE;In German)
Measuring techniques for determination of the load on the outer shell in the critical phase, 15:28740 (RA;DE;In German)
The significance of guniting methods and lining materials to the construction of tunnels, 15:28736 (RA;DE;In German)

SUPPORTS (CATALYST)
See CATALYST SUPPORTS

SURFACE AIR
The ASCOT 1988 valley/tributary interaction study, 15:28996 (R;US)

SURFACE COATING
Robots for aircraft coatings removal: Parameters and requirements, 15:28698 (R;US)

SURFACE MINING
Effect of controlled overburden placement on mine-soil properties and the growth of loblolly pine. Final report, 15:27457 (R;US)
Evaluation of methods for handling and burial of toxic strip-mine spoil. Final report, 15:27447 (R;US)
Summary of Soil Conservation Service activities related to surface coal mining and state regulatory authorities (1984), 15:27462 (R;US)
Technical guides on use of reference areas and technical standards for evaluating surface-mine revegetation in OSM (Office of Surface Mining), Regions 1 and 2, 15:27459 (R;US)

SURFACE PROPERTIES
Method-dependent diffusion coefficients on interactive systems, 15:28666 (J;US)

SURFACE WATERS
See also ESTUARIES
LAKES
PONDS
SEAS
STREAMS
Installation-restoration Program, Phase 2. Confirmation/quantification, Stage 1. Kalispell Air Force Station, Montana. Final report, October 1986-March 1989, 15:27562 (R;US)
Superfund Record of Decision (EPA Region 1): O'Connor Company Site, ME. (First Remedial Action), September 1989. Final report, 15:27567 (R;US)
Superfund Record of Decision (EPA Region 2): Chemical Insecticide, Middlesex County, NJ. (First Remedial Action), September 1989, 15:29074 (R;US)
Superfund Record of Decision (EPA Region 5): Alsco Anaconda, OH. (First remedial action), September 1989, 15:29094 (R;US)
Superfund Record of Decision (EPA Region 7): John's Sludge Pond, Wichita, KS. (First remedial action), September 1989. Final report, 15:27569 (R;US)

SURFACE-ACTIVE AGENTS
See SURFACTANTS

SURFACES
Dynamics of desorption from surfaces, 15:28620 (RA;US)
Interaction of molecules with surfaces, 15:28381 (RA;US)
Interface tribology via nonequilibrium molecular dynamics, 15:28562 (BA;US)
Laser studies of chemical dynamics at the gas - surface interface, 15:28617 (RA;US)
Surface electrochemistry, 15:28673 (J;US)
The effects of shear and normal stress paths on rock friction, 15:27733 (R;US)

SURFACTANTS
Condensation of monovalent and divalent metal ions on a Langmuir monolayer, 15:28653 (J;US)
Small-angle neutron scattering from micelles of potassium salts of 18-carbon fatty acids, 15:28580 (J;US)
Study of mechanisms accompanying ionic surfactant adsorption on solids for low interaction systems. Application to chemical enhanced oil recovery in sandstone deposits, 15:27555 (R;FR;In French)

TFTR TOKAMAK
Alarm Systems
TFTR status and alarm system, 15:29822 (BA;US)
Alpha Detection
Detector array for the measurement of the 14.7 MeV protron emission from TFTR, 15:29720 (BA;US)
Alpha Reactions
Nuclear reaction diagnostics of fast confined and escaping alpha particles, 15:29719 (BA;US)
Alpha Spectra
Approaches to the diagnostics of alpha particles, 15:29728 (BA;US)
Camac System
TFTR CAMAC data acquisition system, 15:29832 (BA;US)
The block transfer system: From conception through the first year of operation, 15:29821 (BA;US)
Charge Exchange
Design concepts for compact mass/energy charge exchange analyzers, 15:29714 (BA;US)
Computer Codes
Software development for TFTR, 15:29823 (BA;US)
Computer Graphics
TFTR computer system graphics support, 15:29824 (BA;US)
Data Processing
TFTR data management system, 15:29825 (BA;US)
Ecr Heating
Electron cyclotron measurements with the fast scanning heterdyne radiometer on the tokamak fusion test reactor, 15:29692 (BA;US)
Study of optically thin electron cyclotron emission from TFTR using a Michelson interferometer, 15:29733 (BA;US)
Electron Density
Parametric study of electron density profile evolution following pellet injection in TFTR, 15:29830 (BA;US)
Fusion Yield
Application of coincidence techniques to fusion product measurements, 15:29760 (BA;US)
Mathematical Models
A probabilistic model for x-ray PHA data, 15:29697 (BA;US)
Mhd Equilibrium
High-β operation and MHD [magnetohydrodynamic] activity on TFTR, 15:29677 (R;US)
Neutron Detection
Neutron fluctuation measurements on TFTR, 15:29721 (BA;US)
Nuclear Reaction Analyzers
Analysis programs and standardization of the neutron activation system at TFTR, 15:29762 (BA;US)
Neutron diagnostics on TFTR utilizing the Campbelling technique, 15:29723 (BA;US)
Particle Losses
Loss of alpha-like MeV fusion products from TFTR, 15:29678 (R;US)
Pellet Injection
Charge conversion of alphas by refueling pellets, 15:29758 (BA;US)
Design and implementation of a control system for deuterium pellet injector, 15:29820 (BA;US)
Plasma Diagnostics
Diagnostics using an injected neutral helium beam, 15:29743 (BA;US)
Scintillation Counters
Scintillation detector for escaping alphas and tritons in TFTR, 15:29759 (BA;US)
Spectroscopy
The CHERS software system: A MicroVAX-based diagnostic, 15:29700 (BA;US)
Thomson Scattering
Feasability study of using the TFTR Thomson scattering system for q profile measurements, 15:29713 (BA;US)
Multichannel Thomson scattering systems with high spatial resolution, 15:29747 (BA;US)

FOM-Rijnhuizen contributions to 16th European conference on controlled fusion and plasma physics, Venice, March 13-17, 1989, 15:29679 (R;NL)
Ballooning Instability
Ballooning instabilities in tokamaks with sheared toroidal flows, 15:29667 (R;CH)
Breakdown
Survey of fusion reactor technology start-up experiment of the KAERIT, 15:29665 (R;KR;In Korean)
Camac System
Data structures for the description of tokamak diagnostics, 15:29694 (BA;US)
Current Density
Expansions of the flux and the current density in toroidal systems, 15:29687 (RA;NL)
Currents
Survey of fusion reactor technology start-up experiment of the KAERIT, 15:29665 (R;KR;In Korean)
Electron Density
Two-dimensional tokamak density distribution measurements using phase-imaging interferometry, 15:29751 (BA;US)
Electron Drift
Three-dimensional simulations of simple electron drift wave turbulence in tokamak geometry, 15:29630 (R;US)
Equilibrium Plasma
Survey of fusion reactor technology start-up experiment of the KAERIT, 15:29665 (R;KR;In Korean)
First Wall
First wall system in the IGNITEX experiment, 15:29840 (BA;US)

Heat Flux
A method for loccal transport analysis in tokamaks with error calculation, 15:29680 (RA;NL)
Ion Temperature
Diagnostics for space and time resolved ion temperature measurements in the STRO-M tokamak, 15:29715 (BA;US)
Magnetic Fields
Impact of high magnetic fields on fusion systems, 15:29844 (BA;US)
Magnetic Flux
Expansions of the flux and the current density in toroidal systems, 15:29687 (RA;NL)
Mass Transfer
The use of positrons to study transport in tokamak plasmas, 15:29703 (BA;US)
Plasma Confinement
Auxiliary heated detached plasmas in tokamaks, 15:29782 (J;US)
Neoclassical transport of isotropic fast ions, 15:29845 (J;US)
Plasma Heating
Parasitic coupling of the fringing fields of an Ion-Bernstein wave antenna, 15:29631 (R;US)
Plasma Microinstabilities
Toroidal microinstability studies of high-temperature tokamaks, 15:29784 (J;US)
Plasma Scrape-Off Layer
Analysis on scrape off layer plasma in toroidal helical systems, 15:29671 (R;JP)
Research Programs
Magnetic Fusion Energy Program: Annual report 1988, 15:29810 (R;US)
Spectrometers
A cw dye laser system for Li beam spectroscopy in a tokamak, 15:29690 (BA;US)
Tearing Instability
Resonant MHD modes with toroidal coupling: Part 1, Tearing modes, 15:29629 (R;US)
Transport Theory
A method for loccal transport analysis in tokamaks with error calculation, 15:29680 (RA;NL)

TOKAMAK FUSION TEST REACTOR

ZIRCONIUM CARBIDES
Thermodynamic analysis of chemical stability of ceramic materials in hydrogen-containing atmospheres at high temperatures. Final report, 15:28493 (R;US)

ZIRCONIUM COMPOUNDS
See also ZIRCONIUM CARBIDES
ZIRCONIUM OXIDES
ZIRCONIUM SELENIDES
ZIRCONIUM SULFIDES
COmparison of the thermal stabilities of amorphous hydrides formed by Zr-based metallic glasses, 15:28502 (BA;US)
Neutron diffraction and transmission electron microscopy study of hydrogen-induced phase transformations in Zr_3Al, 15:28449 (J;US)

ZIRCONIUM OXIDES
Thermodynamic analysis of chemical stability of ceramic materials in hydrogen-containing atmospheres at high temperatures. Final report, 15:28493 (R;US)

ZIRCONIUM SELENIDES
Energy factors governing the partial irreversibility of lithium intercalation in layered trichalcogenides MX_3 (M = Ti, Zr, Hf; X = S, Se) and the structural changes in the intercalated species Li_3MX_3, 15:28669 (J;US)

ZIRCONIUM SULFIDES
Energy factors governing the partial irreversibility of lithium intercalation in layered trichalcogenides MX_3 (M = Ti, Zr, Hf; X = S, Se) and the structural changes in the intercalated species Li_3MX_3, 15:28669 (J;US)

ZT-40 DEVICES
Multi-chord, near infrared interferometers for the CTX and ZT-40M experiments, 15:29731 (BA;US)

ZT-P DEVICES
Fiber-optic control of the ZT-P experiment, 15:29816 (BA;US)

Contract Number Index

Numbers assigned to DOE contracts announced in documents in this publication are listed. Contract numbers are sorted alphanumerically and list the primary corporate author of the document cited, the citation number, and the report number or other document identification.

Contract No.	Abstract No.	Report No.

Report Number Index

The report number index consists of the alphanumeric identifiers assigned to report literature as well as patent and conference literature cited in this publication. Entries provide the abstract number; the source(s) of availability of the document; the GPO file prefix for GPO depository library documents; the order number for OSTI and NTIS report ordering purposes; and, if the document was distributed under the DOE distribution program, the category number is shown for paper copy (PC), microfiche (MF), or no distribution (ND). These categories are included to assist DOE librarians in responding to requests for reports in their collections. The index also lists secondary numbers, with the corresponding abstract numbers and cross-references to other identifying numbers.

Report Number	*Abstract Number*	*Source of Availability*	*GPO Dep.*	*Order Number*	*Distribution Category*

Codes Used on Index Lines

Following the citation numbers in the Corporate Author, Personal Author, and Subject Indexes, codes are used to designate the type of document, country of publication, and language of the document, e.g., (R;SU;In Russian). The language designator does not appear if the document is published in English.

ORDER FORM

DOE and DOE Contractors: Fill in Parts I, II, and IV. **Others:** Fill in Parts I, III, and IV. Mark appropriate blanks in Part IV to indicate quantity and form (microfiche or paper copy).

I. SHIPPING AND PAYMENT INFORMATION

Ordering Address

Name _____ Telephone _____

Address _____

City _____ State _____ Zip _____

Shipping Address (if different from above)

Name _____

Address _____

City _____ State _____ Zip _____

_____

SIGNATURE (Required to validate ALL orders)

II. OSTI ORDERS (DOE and DOE contractors can order from OSTI.)

☐ Charge OSTI deposit account no. _____

Mail orders to: U.S. Department of Energy
Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, TN 37831

III. NTIS ORDERS

☐ Charge NTIS deposit account no.

☐ Check/Money Order enclosed for $

☐ Charge to my ☐ American Express ☐ VISA ☐ Mastercard

_____ _____
Account Number **Card expiration date**

☐ Ship and Bill (see below for restrictions)

Employer identification number (9 digits) _ _–_ _ _ _ _ _ _

Purchase Order number _____

Phone number of billing office _____
(Required for Ship & Bill orders)

Ship & Bill service is restricted to North American business locations for an extra $7.50 per order (or per Custom Search). The business' employer identification number plus the phone number of the office paying the bill are required to process these requests. A late payment charge will be applied to billings more than 30 days overdue. Prepaying, using an NTIS Deposit Account or a charge account, speeds order processing. Be sure payment and order are sent together. Checks, payable to NTIS, must be in U.S. dollars.

Mail orders to: U.S. Department of Commerce
National Technical Information Service
5285 Port Royal Road
Springfield, VA 22161

IF NO METHOD OF PAYMENT IS INDICATED, YOUR ORDER WILL BE RETURNED TO YOU AS A PRICE QUOTE UNPROCESSED.

Federal Depository Library Program

As a result of an agreement between the U.S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are not sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
